Ju-Jutsu. | | | |
ITALY (Italia), the name applied both in ancient and in modern times to the great peninsula that projects from the mass of central Europe far to the south into the Mediterranean Sea, where the island of Sicily may be considered as a continuation of the continental promontory. The portion of the Mediterranean commonly termed the Tyrrhenian Sea forms its limit on the W. and S., and the Adriatic on the E.; while to the N., where it joins the main continent of Europe, it is separated from the adjacent regions by the mighty barrier of the Alps, which sweeps round in a vast semicircle from the head of the Adriatic to the shores of Nice and Monaco.

**Topography.**—The land thus circumscribed extends between the parallels of 46° 40' and 36° 38' N., and between 6° 30' and 18° 30' E. Its greatest length in a straight line along the main-land is from N.W. to S.E., in which direction it measures 708 m. in a direct line from the frontier near Courmayeur to Cape Sta Maria di Leuca, south of Otranto, but the great mountain peninsula of Calabria extends about two degrees farther south to Cape Spartivento in lat. 37° 55'. Its breadth is, owing to its configuration, very irregular. The northern portion, measured from the Alps at the Monte Viso to the mouth of the Po, has a breadth of about 270 m., while the maximum breadth, from the Rocca Chiardonnet near Susa to a peak in the valley of the Isonzo, is 334 m. But the peninsula of Italy, which forms the largest portion of the country, nowhere exceeds 150 m. in breadth, while it does not generally measure more than 100 m. across. Its southern extremity, Calabria, forms a complete peninsula, being united to the mass of Lucania or the Basilicata by an isthmus only 35 m. in width, while that between the gulfs of Sta Eufemia and Squillace, which connects the two portions of the province, does not exceed 20 m. The area of the kingdom of Italy, exclusive of the large islands, is computed at 91,277 sq. m. Though the Alps form throughout the northern boundary of Italy, the exact limits at the extremities of the Alpine chain are not clearly marked. Ancient geographers appear to have generally regarded the remarkable headland which descends from the Maritime Alps to the sea between Nice and Monaco as the limit of Italy in that direction, and in a purely geographical point of view it is probably the best point that could be selected. But Augustus, who was the first to give Italy a definite political organization, carried the frontier to the river Varus or Var, a few miles west of Nice, and this river continued in modern times to be generally recognized as the boundary between France and Italy. But in 1860 the annexation of Nice and the adjoining territory to France brought the political frontier farther east, to a point between Mentone and Ventimiglia which constitutes an artificial limit.

Towards the north-east, the point where the Julian Alps approach close to the seashore (just at the sources of the little stream known in ancient times as the Timavus) would seem to constitute the best natural limit. But by Augustus the frontier was carried farther east so as to include Tergeste (Trieste), and the little river Formio (Risano) was in the first instance chosen as the limit, but this was subsequently transferred to the river Arsr (the Arsa), which flows into the Gulf of Quarnaro, so as to include almost all Istria; and the circumstance that the coast of Istria was throughout the middle ages held by the republic of Venice tended to perpetuate this arrangement, so that Istria was generally regarded as belonging to Italy, though certainly not forming any natural portion of that country. Present Italian aspirations are similarly directed.

The only other part of the northern frontier of Italy where the boundary is not clearly marked by nature is Tirol or the valley of the Adige. Here the main chain of the Alps (as marked by the watershed) recedes so far to the north that it has never constituted the frontier. In ancient times the upper valleys of the Adige and its tributaries were inhabited by Raetian tribes and included in the province of Raetia; and the line of demarcation between that province and Italy was purely arbitrary, as it remains to this day. Tridentum or Trent was in the time of Pliny included in the tenth region of Italy or Venetia, but he tells us that the inhabitants were a Raetian tribe. At the present day the frontier between Austria and the kingdom of Italy crosses the Adige about 30 m. below Trent—that city and its territory, which previous to the treaty of Lunéville in 1801 was governed by sovereign archbishops, subject only to the German emperors, being now included in the Austrian empire.

While the Alps thus constitute the northern boundary of Italy, its configuration and internal geography are determined almost entirely by the great chain of the Apennines, which branches off from the Maritime Alps between Nice and Genoa, and, after stretching in an unbroken line from the Gulf of Genoa to the Adriatic, turns more to the south, and is continued throughout...
Central and Southern Italy, of which it forms as it were the backbone, until it ends in the southernmost extremity of Calabria at Cape Spartivento. The great spur or promontory projecting towards the east to Brindisi and Otranto has no direct connexion with the central chain.

One chief result of the manner in which the Apennines traverse Italy from the Mediterranean to the Adriatic is the marked division between Northern Italy, including the region north of the Apennines and extending thence to the foot of the Alps, and the central and more southerly portions of the peninsula. No such line of separation exists farther south, and the terms Central and Southern Italy, though in general use among geographers and convenient for descriptive purposes, do not correspond to any natural divisions.

1. Northern Italy.—By far the larger portion of Northern Italy is occupied by the basin of the Po, which comprises the whole of the broad plain extending from the foot of the Apennines to the little belt of the Alps, with both sides of it. From its source in Monte Viso to its outflow into the Adriatic—a distance of more than 220 m. in a direct line—the Po receives all the waters that flow from the Apennines northwards, and all those that descend from the southern Alps. Entering the plain near Piacenza, a distance of more than 150 m., during which the underfalls of the mountains continually approach it on the left, without once crossing the line of road.

The Po is the first river that the visitor to Northern Italy will be best described by following the course of the Po. That river has its origin as a mountain torrent descending from two little dark lakes on the north flank of Monte Viso, at a height of more than 6000 ft. above the sea; and after a course of less than 15 m., it reaches the plain at Salto, on the map, to which it adds the south branch of the Osola, which is about 70 m. till it enters the plain at Ivrea, and, after flowing about 20 m. more, joins the Po a few miles below Chivasso. This great valley—one of the most considerable on the southern side of the Alps—has attracted special attention. It is well known that two of the most frequented passes across the great mountain chain—the Great and the Little St Bernard—are the chief outlets of the Po. The area which includes the plains of the Po has its source in the glaciers of Monte Viso, and descends through the Po to the Adriatic, with a distance of about 500 m. between the city of Turin, the most extensive plain in the plains of Northern Italy, and the Po, and a width of about 100 m. between the Po and the mountains. This is known as the Po de la Chair, having its delta at the mouth of the Po in the Adriatic, and forming a large expanse of water, which is divided into two branches, the one for the north, and the other for the south. The Po, as it enters the plain, is divided into two branches, the one for the north, and the other for the south. The Po, as it enters the plain, is divided into two branches, the one for the north, and the other for the south. The Po, as it enters the plain, is divided into two branches, the one for the north, and the other for the south.
The line of the highest summits and of the watershed ranges is about 30 to 40 m. from the Adriatic, while about double that distance separates it from the Tyrrenhian Sea on the west. In this part of the range almost all the highest points of the Apennines are found. There are two parts of the Apennines—first the Lepini, a series of hills, which rise near Torriglia (4510 ft.) and Monte Nerone (5010 ft.), Monte Catra (5990), and Monte Maggio to the Monte Pennino near Nocera (5160 ft.) and thence to the Monte Tornillo (5830 ft.). Proceeding thence southwards, we find in succession the Monte Vettore (8128 ft.), the Pizzo di Sevo (7945 ft.), and the two great mountain masses of the Monte Corno, commonly called the Gran Sasso and the Monte della Maiella. The Gran Sasso, the mountain whose summit is at an elevation of 9560 ft., and the Monte della Maiella, its highest summit measuring 9170 ft. Farther south no very lofty summits are found till we come to the group of Monte del Matese, in Sanninum (6600 ft.), which is a great mountain mass limited on the south by a small range of hills, which is known as the Salerno province. Besides the lofty central masses enumerated there are two other lofty peaks, outliers from the main range, and separated from it by valleys of considerable extent. These are the Monte Terminillo, near Leonessa (7278 ft.), and the Monte Velino near the Lago Fucino, rising to 8192 ft., both of which are covered with snow from November till May. But the Apennines of Central Italy, instead of presenting, like the Alps and the northern Apennines, a definite central ridge, with transverse valleys leading down from it on both sides, in reality constitute a mountain mass of very considerable breadth, composed of a number of minor ranges and groups of mountains, which preserve a generally parallel direction, and are separated by upland valleys, which are the overflow plains of the rivers. In the south side of the Fucino basin still higher is the valley of the Gizio (a tributary of the Aterno), of which Sulmona is the chief town. This communicates with the upper valley of the Sangro by a level plain called the Piano dei Marmi, and which, at the point of the Fucino, is the wine country spot in Italy. Nor do the highest summits form a continuous ridge of great altitude for any considerable distance; they are rather a series of groups separated by tracts of very inferior elevation forming natural passes, which are the chief means of communication (as is the case in almost all limestone countries) by the waters from the upland valleys turning suddenly at right angles, and breaking through the mountain ranges which bound them. Thus the Gran Sasso is separated from the Sanninum by the Liri valley; the Tronto breaks through the range between Monte Vettore and the Pizzo di Sevo. This constitution of the great mass of the central Apennines has in all ages exercised an important influence upon the character of this portion of Italy, which may be considered as divided by nature into two great regions, a cold and barren upland country, bordered on both sides by rich and fertile tracts, enjoying a warm but temperate climate.

An important part of Tuscany, a region of great beauty and fertility, though inferior in productivity to Northern Italy, coincides in a general way with the countries familiar to all students of ancient history as Etruria and Latium. Until the union of Italy they were considered as forming the independent kingdom of Tuscany. This north-eastern part of Tuscany is indeed occupied to a considerable extent by the upland valleys and slopes of the Apennines, which, besides the slopes and spurs of the main range that constitutes its northern frontier, presents other ranges or outliers.

Of these the most remarkable is the group between the valleys of the Serchio and the Magra, commonly known as the mountains of Carrara, from the celebrated marble quarries in the neighborhood of that city. Two of the summits of this group, the Pizzo d'Uccello and the Pania delle Croce, attain 6145 and 6100 ft. Another lateral range, the Prato Magno, which branches off from the central chain at the Monte Falterona, and separates the upper valley of the Serchio from the lower, is the group, which rises several hundred feet above the main branch, called the Alpi di Catenaia, of inferior elevation, divides the upper course of the Arno from that of the Tiber.

The rest of this tract is for the most part a hilly, broken country, of considerable altitude, and traversed by a series of parallel ridges, an isolated mass of volcanic origin, attains a height of 5650 ft. South of this the country between the frontier of Tuscany and the Tiber is in great part of volcanic origin, forming hills with distinct crater-shaped basins, and volcanic cones, of which the chief is the Monte Amiata, a symmetrical cone, rising to 7427 ft., famous for its thermal springs, which always keep a water temperature near 36° C. and form a large and rugged mountain mass, nearly 5000 ft. in height, which descends to the sea at Terracina, and
between that point and the mouth of the Liri throws out several rugged mountain headlands, which may be considered as constituting the natural boundary between Latium and Campania, and consequently the natural limit of Central Italy. Besides these offshoots of the Apennines the entering of the Liri divides in two the group of detached mountains, rising almost like islands on the seashore, of which the two most remarkable are the Monte Argentario on the coast of Tuscany near Orbetello (2087 ft.) and the Monte Circeo (1777 ft.) at the angle of the Pontine Marshes, by the whole breadth of which the entrance to the Tiber estuary, of 150 ft. width and 7000 ft. in height. The range is, however, continued through the province now called Calabria, to the southern extremity of "foot" of Italy, but presents in this part a very much altered character, the exceptions, which may be considered as the true continuation of the chain as far as the neighbourhood of Nicotera, may be little close to the west coast, being flanked on the east by a great mass of granitic mountains, rising to about 6000 ft., and covered with vast forests, from which it derives the name of La Sila. A similar mass, which extends across the south-eastern part of the island, forms the deep Gulf of Taranto, about 70 m. in width, and somewhat greater depth, which receives a number of streams from the central mass of the Apennines.

The whole of Southern Italy is of any great importance. The Liri (Liris) or Garigliano, which has its source in the central Apennines above Sora, not far from Lake Fucino, and enters the Gulf of Gaeta about 10 m. east of the city of that name, brings down a considerable body of water; as does also the Volturno, which rises in the mountains between Castel di Sangro and Agnone, flows past Isernia, Venafrò and Capua, and enters the sea about 15 m. from the mouth of the Garigliano. About 16 m. above Capua it receives the Calore, which flows by Benevento. The Silarus or Sele enters the Gulf of Salerno for a distance of 150 m., and this river, the most important of the washers of the Apennines is too near to the sea on that side to allow the formation of any large streams. Hence the rivers that flow in the opposite direction into the Adriatic and the Gulf of Taranto have much longer courses, though all partake of the character of mountain streams, with many falls, and in consequence much Food, and after storms, but dwindling in the summer into scanty streams, which hold a winding and sluggish course through the great plains of Apulia. Proceeding south from the Trigno, already mentioned as coming from Monte Gargano in the south-eastern part of the country, the (2) the Fortore, both rising in the mountains of Samnium, and flowing into the Adriatic west of Monte Gargano; (3) the Cervaro, south of the great promontory; and (4) the Oianto, the Aulibus of Horace, which description is it characteristic of almost all the rivers of Southern Italy, of which it may be taken as the typical representative. It rises about 15 m. west of Conza, and only about 25 m. from the Gulf of Salerno, so that it is frequently (though erroneously) described as forming the whole range of the Apennines. In its lower course it flows near Campania, and receives the (5) the Grado, which rises near Ventosa, almost at the foot of Monte Volturno, flows towards the south-east into the Gulf of Taranto, as do the Basento, the Agri and the Sinni, all of which descend from the Central Apennines. In the province of the Cilento, which flows from Cosenza northwards, and then turns abruptly eastward to enter the same gulf, is the only stream worthy of notice in the rugged peninsula of Calabria; and the arid limestone plains of the district, known as the Cilento, do not give rise to anything more than a mere streamlet, from the mouth of the Oianto to the south-eastern extremity of Italy.

The only important lakes are those on or near the north frontier, formed by the expansion of the tributaries of the Po. They have been somewhat extended by artificial means; and if they are formed, they may be again enumerated in order of succession. They are, proceeding from west to east, (1) the Lago d'Orta, (2) the Lago Maggiore, (3) the Lago di Lugano, (4) the Lago di Como, (5) the Lago d'Iseo, (6) the Lago d'Idro, and (7) the Lago Maggiore of the Garda. Of these the last named is considerably the largest, covering an area of 154 sq. m. It is 321 m. long by 10 broad; while the Lago Maggiore, notwithstanding its name, though considerably exceeding in length (37 m.) falls materially below it in superficial extent. They are all great depth—the Lago Maggiore having an extreme
depth of 1198 ft., while that of Coma attains to 1365 ft. Of a wholly different character is the Lago di Varese, between the Lago Maggiore and that of Lugano, which is a mere shallow expanse of water, surrounded by hills of very moderate elevation. Two other small lakes, well known to bathers, as well as those of Erba and Pusiano, between Como and Lecco, are of a similar character.

The lakes of Central Italy, which are comparatively of trifling dimensions, belong to a wholly different class. The most important of them, and the best known, is the Lago Miseno, an entirely volcanic lake, situated almost exactly in the centre of the peninsula, occupies a basin of considerable extent, surrounded by mountains and without any natural outlet, at an elevation of more than 2000 ft. Its water, which in great part carried off by an artificial channel and more than half its surface laid bare. Next in size is the Lago Trasimeno, a broad expanse of shallow waters, about 30 m. in circumference, surrounded by low hills. The neighbouring lake of Chiusi is of much smaller extent, but contained much water, and of the lakes of Central Italy, which are scattered through the volcanic districts west of the Apennines, are of an entirely different formation, and occupy deep cup-shaped hollows, which have undoubtedly at one time formed the craters of extinct volcanoes. Such is the Lago di Bolsena, near the city of the same name, which is an extensive sheet of water, as well as the much smaller Lago di Vico (the Cilician lake of ancient writers) and the Lago di Bracciano, nearer Rome, while to the south of Rome the well known lakes of Albano and Nemi have a similar origin.

The only lake properly so called in southern Italy is the Lago del Matese, in the heart of the mountain group of the same name, of square form, and surrounded by hills. The lakes of the Sibillini, both north and south of the promontory of Gargano are brackish lagoons communicating with the sea.

The three great islands of Sicily, Sardinia and Corsica are closely connected to the mainland by narrow but important straits, and of these the smallest, its most active, and the most northern, the southernmost, and is a mere rock, inhabited by a few fishermen. South of Elba are the equally insignificant islets of Pianosa and Monte Cristo, while the more considerable island of Giglio lies much nearer the coast of Tuscany. South of Pisanos is the island of Monte Argentario, itself almost an island. The islands farther south in the Tyrrhenian Sea are of an entirely different character. Of these Ischia and Procida, close to the northern headland of the Bay of Naples, are of volcanic origin, as is the case also with the more distant group of the Ponza Islands. These are three in number—Ponza, Palmarola and Zannone; while Ventotene (also of volcanic formation) is about midway between Ponza and Ischia. The island of Capri is of the same nature as that of Miseno, and is one of the most beautiful parts of the Bay of Naples, is a precipitose limestone rock. The Aeolian or Lipari Islands, a remarkable volcanic group, belong rather to Sicily than to Italy, though Stromboli, the most easterly of them, is about equidistant from both sides of the strait. The island of Pantelleria, a part of the Sicilian province of Tonnara, a small island, and the small outlying group of the Tremiti Islands (north of the Monte Gargano and about 15 m. from the mainland) alone breaks the monotony of this part of the Adriatic.

Geography. The geography of Italy is mainly dependent upon that of the Apennines (q.v.). On each side of that great chain are found extensive Tertiary deposits, sometimes, as in Tuscany, the district of Monferrat, &c., forming a broken, hilly country, at others spreading into broad plains or undulating downs, such as the Tavolere of Puglia, and the tract that forms the spur of Italy from the Adriatic.

Besides these, and leaving out of account the islands, the Italian peninsulas present four distinct volcanic districts. In three of them the volcanoes are entirely extinct, while the fourth is still in active activity.

1. The Euganean hills form a small group extending for about 15 miles from the neighbourhood of Padua to Este, and separated from the lower bank of the river Piave by a range of hills, the highest of which, the summit of Monte Venta, their highest peak, is 1890 ft. high.

2. The Roman district, the largest of the four, extends from the hills of Albano to the frontier of Tuscany, and from the lower slopes of the Sabine hills, in the north, to the bank of the Tiber in the south. It may be subdivided into three groups: the Monti Albani, the second highest of which, Monte Cavo (3115 ft.), is the ancient Mons Albanus, on the summit of which stood the temple of Jupiter Latialis, while the assemblies of the Ostienses celebrated the festival of the Luperci and exalted the genius of the city. The second group is that of the Monti Consolati, the third that of the Monti Cimini, which extend from the valley of the Tiber to the neighbourhood of Civita Vecchia, and attain at their culminating point an elevation of 3454 ft.; and the mountains of Radicofani and Monte Amiata, the latter of which is 6808 ft. high. The lakes of Bolsena (Vulsiniensis), of Bracciano (Sabatinus), of Vico (Ciminius), of Albano, and of Nemi, belong to this district; while between its south-west extremity and Monte Circello the Pontic Marshes form a broad strip of alluvial soil infested by malaria.

3. The outlying group of the Terra di Lavoro is separated by the Volcanic mountains from the Roman district. It may be also divided into three groups. Of Roccamonfina, at the N.W. end of the Campanian Plain, the highest point, called Montagna di Santa Croce, where the Rebecca Fields embrace all the country round, and the western part of the province of Baiate and Pozzuoli and the adjoining islands. Monte Barbaro (Gaurus), north-east of the site of Cumae, Monte San Nicolò (Epomeus), 3589 ft. in a, and Cumoldoli, 1488 ft., west of the island of Ischia, and the group of the Solfatara, near the east end of the latter, and that of the Aversa, south of the Gulf of Policastro, and the eastern part of the island of Ischia.

4. The Apulian volcanic formation consists of the vast mass of Monte Vulture, which rises at the west end of the plains of Apulia, on the frontier of Basilicata, and is surrounded by the Apennines on the north, the Apulia sea on the south, and the Calabria Sea on the west. The authorities differ as to the height of Mount Vulture; according to Pasquale di Meli, attains an elevation of 4365 ft. Within the widest crater there are the two small lakes of Monticchio and San Michele. In connexion with the volcanic districts we may mention Monte Vulture, Vulture, and the province of Avellino, Campania (Virgil, Aenid, vii. 591-591). The largest is not more than 160 ft. in circumference, and 7 ft. deep. The whole of the great plain of Lombardy is covered by Pleistocene deposits, the accumulation of which has been already mentioned. The Adriatic Sea filled up by deposits brought down by the rivers from the mountains. The depression was probably formed during the later stages of the growth of the Alps.

The geographical situation of Italy, extending from about 46° to 38° N., renders it one of the hottest countries in Europe. But the effect of its southern latitude is tempered by its peninsular character, bounded as it is on both sides by the Adriatic and the Mediterranean, and on the west by the Adriatic Sea filled up by deposits brought down by the rivers from the mountains. The depression was probably formed during the later stages of the growth of the Alps.

The climate of Italy is generally of a temperate character, but the extent and duration of the cold season vary much from south to north, the greatest extremes being to be found at the southernmost extremity of the country. In the cold season, for example, while the Alps are covered with snow, the southernmost parts of Italy are warmed by the rays of the sun. The lowest recorded winter temperature at Turin is 5° F. Throughout the region north of the Apennines no plants will thrive which cannot stand occasional severe frosts in winter, so that not only oranges and lemons but even the olive tree cannot be grown, except in specially favoured situations. But the strip of coast between the Apennines and the sea, known as the Riviera of Genoa, is not only extremely favourable to the growth of olives, but produces oranges and lemons in abundance even the aloe, the cactus and the palm flourish in many places.

Central Italy also presents striking differences of climate and temperature according to the greater or lesser proximity to the mountains, and the latitude in which they lie. Those that lie nearest to Rome, enjoy a mild winter climate, and are well adapted to the growth of mulberries and olives as well as vines, but it is not till after passing Terracina, in proceeding along the western coast towards Genoa, that the mildness of the climate gives place to that of the Apennines, and the full range of the Mediterranean climate. Even in the central parts of Tuscany, however, the climate is very much affected by the neighbouring mountains, and the increasing elevation of the Apennines as they proceed southwards intercepts a considerable part of the annual temperature, but it does not reach the central ranges of the Appennine chain that we find the coldest districts of Italy. In all the upland valleys of the Abruzzi snow begins to fall early in November, and heavy storms occur often as late as May; whole communities are shut out for months from any intercourse with their neighbours, and some villages are so long buried in snow that regular passages are made between the different houses for the sake of communication among the inhabitants. The district from the south-east of Lake Fucino to the Piano di Cinque Miglia, enclosing the upper basin of the Sangro
and the small lake of Scanno, is the coldest and most bleak part of Italy south of the Alps. Heavy falls of snow in June are not uncommon, and only for a short time towards the end of July are the nights totally exempt from light frosts. Yet less than 40 m. E. of this district, and even more so to the north, the olive trees flourish in the shade of the Adriatic from Ortona to Vasto. In the same way, as in the plains and hills round Napoletan snow is rarely seen, and never remains long, and the thermometer seldom descends to the freezing-point, 20 m. E. from it in the fertile Apennines, no great elevation, light frosts are not uncommon as late as June; and 18 m. farther east, in the elevated region of San Angelo dei Lombardi and Bisaccia, the inhabitants are always warmly clad, and vines grow with great luxuriance. Still farther east, the Alloa of Benevento and Potenza has almost the coldest climate in Italy, and certainly the lowest summer temperatures. But nowhere are these contrasts so striking as in Calabria. The shores, especially on the Tyrrhenian Sea, are occupied almost entirely by vineyards and olive groves, with a few pomegranates, the liquorice-root growing wild, and the mastic, the myrtle, and many varieties of oleander and cistus form the underwood of the natural forests of arbutus and evergreen oak. If we turn inland but 5 or 6 m. from the shore, and often even less, the vines are completely covered by a growth of hedges. Here districts covered with oaks and chestnut succeed to this almost tropical vegetation; a little higher up and we reach the elevated regions of the Pollino and the Sila, covered with firs and pines, and affording rich pastures even in the midst of summertime, and the cold frosts do not allow of their springing up in August, and snow begins to appear at the end of September or early in October. Along the shores of the Adriatic, which are exposed to the north-east winds, blowing coldly from over the Albanian mountains, the grape plants do not thrive so well in general as under the same latitude along the shores of the Tyrrhenian Sea.

Southern Italy indeed has in general a very different climate from the northern portion of the kingdom; and, though large tracts are of sufficient elevation to render them fit for TWO, the snow for a considerable part of the year, the districts adjoining the sea enjoy a climate similar to that of Greece and the southern provinces of Spain. Unfortunately these fertile tracts suffer severely from malaria (q.v.), and especially the great plain adjoining the Gulf of Taranto, which in the early ages of history was surrounded by a girdle of Greek cities—some of which attained to almost unexampled prosperity—has for centuries past been given up to almost complete desolation. In the table of the vegetable productions of Italy, many of the present day among the first to attract the attention of the visitor are of comparatively late introduction, and are unknown in ancient times. The olive indeed in all ages clothed the hills of Italy, and the grape is of small importance; but the cabbage, celeriac, and other vegetables are now introduced, and a great importation of them is carried on, especially from the islands of the Adriatic. The cypress, ilex and stone-pine, however, are native trees, the last-named flourishing especially near the coast. The proportion of evergreens is large, and has a marked effect on the landscape in winter.

The chamois, bouquetin and marmot are found only in the Alps, not at all in the Apennines. In the latter the bear was found in Roman times, and there are said to be still a few remaining. Wolves are more numerous, though only in the mountainous districts, and not found in great numbers by large white guard dogs, who have some wolf blood in them. Wild boars are also found in mountainous and forest districts. Foxes are common in the neighbourhood of Rome. The sea mammals include the common dolphin, Tursiops truncatus; the common dolphin, Tursiops truncatus; and the less rare monk seal, Monachus monachus. The most famous bird of passage is the bird of passage is the eagle, Aquila heliaca; and the American pelican, Pelecanus onocrotalus, is also now occasionally seen in Italy. In the southern portion of the Adriatic, especially near the Lake of Como, on their passage. Large numbers of quails are shot in the spring. Among reptiles, the various kinds of lizard are noticeable. There are several varieties of snakes, of which three species (all vipers) are poisonous. Of sea-fish there are many varieties, the tunny, the sardine and the anchovy being commercially the most important. Some of the other edible fish, such as the palombo, are not found in northern waters. Small cuttlefish are in common use as an article of diet. Tortoise-shell, an important article of commerce, is derived from the Testudo tortoise, a sea turtle. Of freshwater fish the trout of the mountain streams and the eels of the coast lagoons may be mentioned. The tarantula spider and the scorpion are found in the south of Italy. The aquarium of the zoological station at Naples contains the finest collection in the world of marine animals, shells, corals, and a variety of the different species of fish, molluscs, crustacea, &c., found in the Mediterranean. (E. H. B.; T. As.)

Population.—The following table indicates the areas of the provinces (sixty-nine in number), and the population of each according to the censuses of the 31st of December 1881 and the 9th of February 1901. (The larger divisions or compartments in which the provinces are grouped are not officially recognized.)

1 On the influence of malaria on the population of Early Italy see W. H. S. Jones in Annals of Archaeology and Anthropology, ii. 97 sqq. (Liverpool, 1900).
ITALY

The average density increased from 257.21 per sq. m. in 1881 to 293.28 in 1901. In Venetia, Emilia, the Marches, Umbria and Tuscany the proportion of concentrated population is only from 40 to 53%; in Piedmont, Liguria and Lombardy the proportion rises to 70 to 75%; in southern Italy, Sicily and Sardinia it attains a maximum from 76 to 93%.

The population of towns over 100,000 is given in the following table according to the estimates for 1906. The population of the town itself is distinguished from that of its commune, which often includes a considerable portion of the surrounding country.

</table>

The number of foreigners in Italy in 1901 was 61,006, of whom 37,762 were domiciled within the kingdom.

The population given in the foregoing table is the resident or 'legitimate' population; it is also given for the individual towns. This is 490,251 higher than the actual population ascertained by the census of the 10th of February 1901; the difference is due to temporary absences from their residences of certain individuals in military service, &c., who were probably counted twice, and also to the fact that 490,020 individuals were returned as absent from Italy, while only 61,006 foreigners were in Italy at the date of the census. The kingdom is divided into 69 provinces, 284 districts, of which 197 are classed as circondari and 87 as districts (the latter belonging to the provinces of Mantua and the 8 provinces of Venetia, 1860 administrative divisions (mandamenti) and 826 communes. These were the figures at the date of the census. In 1906 there were 1805 mandamenti and 1850 communes, and 4 boroughs in Sardinia not connected with communes. The mandamenti or administrative divisions no longer correspond to the judicial divisions (mandamenti giudiziari) which in November 1891 were reduced from 1860 to 1355 in law which provided that judicial reform should not modify existing administrative and electoral divisions. The principal elective local administrative bodies are the provincial and the communal councils. The franchise is somewhat wider than the parliamentary. Both bodies are elected for six years, one-half being renewed every three years. The provincial council is elected by ballot by the communal council and the municipal council a municipal council from among its own members; these smaller bodies carry on the business of the larger which are not sitting. The syndics of each commune is elected by ballot by the communal council.

The actual (not the resident or 'legal') population of Italy since 1770 is approximately given in the following table (the first census of the kingdom as a whole was taken in 1871):
ITALY

AGRICULTURE

Agriculture.—Accurate statistics with regard to the area occupied in different forms of cultivation are difficult to obtain, both on account of their varied and piecemeal character and from the lack of a complete cadastral survey. A complete survey was ordered by the law of the 1st of March 1886, but many years must elapse before its completion. The law, however, enabled provinces most heavily burdened by land tax to accelerate the process; and a new assessment of the tax on the new basis. An idea of the effects of the survey may be gathered from the fact that the assessments in the four provinces of Mantua, Ancona, Cremona, and Milan, which formerly amounted to a total of 1,454,606, are now £2,788,080, an increase of 91%. Of the total area of Italy, 70,793,000 acres, 71% are classed as “productive.” The unproductive area comprises 16% of the total area (this includes 4% occupied by lagoons or marshes, and 1-75% of the total area susceptible of bonificazione or improvement by drainage. Between 1882 and 1902 over £4,000,000 was spent on this by the government). The cultivated area is 13%. This includes 3-5% of the total susceptible of cultivation.

The cultivated area may be divided into five agrarian regions or zones, named after the variety of tree culture which flourishes in them. (1) The Foreste, or forest region, is almost the whole of Sicily and parts of the southern provinces of Calabria, the Abruzzi, the Marches, Umbria, Toscany, and Venetia. It is under the forest laws, and the trees are for the most part for the production of fuel, and not for the forests. (2) The region of olive culture includes the interior Sicilian valleys and part of the mountains of Sardinia and Apulia, where the olive is cultivated in the most productive manner. (3) The region of vine culture includes the Apennine portions of Tuscany, Umbria, and Venetia, and the plains of Lombardy and Emilia. In Sardinia the olive region is the most productive, and in Sicily the most productive of all. (4) The region of chestnut culture includes the valleys of the Apennines and the plains of Lombardy and Emilia. In Sardinia the chestnut culture is the most productive, and in Sicily the most productive of all. (5) The region of wood culture includes the Apennines and the plains of Lombardy and Emilia. In Sardinia the wood culture is the most productive, and in Sicily the most productive of all.

Between these regions of tree culture lie zones of different herbaceous culture, cereals, vegetables, and textile plants. The style of cultivation varies according to the nature of the ground, terraces supported by stone walls being much used in mountainous districts. Cereal cultivation occupies the foremost place in the provinces, though it is not so prevalent as in Italy on the whole. Wheat is the most important grain and is widely distributed. In 1905, 717,221 emigrants was made up, as regards numbers, mainly by individuals from Venetia, Sicily, Campania, Piedmont, and the Abruzzi; while the percentage was highest in Calabria (4.44), the Abruzzi, Venetia, Basilicata, the Marches, Sicily (2.86), Campania, Piedmont (2.02). The figures for 1905 show that the total of 718,221 emigrants was made up, as regards numbers, mainly by individuals from Venetia, Sicily, Campania, Piedmont, Calabria and the Abruzzi; while the percentage was highest in Calabria (4.4%), the Abruzzi, Venetia, Basilicata, the Marches, Sicily (2.86), Campania, Piedmont (2.02). The figures for 1905 show that the total of 718,221 emigrants was made up, as regards numbers, mainly by individuals from Venetia, Sicily, Campania, Piedmont, Calabria and the Abruzzi; while the percentage was highest in Calabria (4.4%), the Abruzzi, Venetia, Basilicata, the Marches, Sicily (2.86), Campania, Piedmont (2.02).
reached about 96,250,000 bushels, a slight increase on the average. The production of maize is, however, insufficient, and 208,719 tons were imported in 1902—about double the amount imported in 1882.

Rice is cultivated in low-lying moist lands, where spring and summer rain are abundant. In the plains of the Po and the delta of the Ticino, the cultivation of rice is extensively carried on, and about 125,000 tons are produced annually. This amount is sufficient to supply the domestic market, and about 40,000 tons are exported to the more northern countries, particularly to France.

Among the cereals, millet and panicum sorghum (Panicum italicum), have a limited cultivation, and are used for fodder. The cultivation of rice and millet is comparatively scarce. The principal are: white beans, largely consumed by the working classes; lentils, much less cultivated than beans; and green peas, largely consumed in Italy, and exported as a spring vegetable. The bean tree is a native of Italy, and is extensively cultivated in the south, especially in the Neapolitan provinces. Horse beans are grown, especially in the south, and in the islands; lupines are also grown for fodder.

Among tuberous vegetables the potato comes first. The area occupied is 0.27 million acres, and the output is 9,572,000 tons. Of the total area, 0.25 million acres are cultivated in the central provinces, as an alternative crop to wheat. They yield as much as 12 tons per acre. Beetroot (Beta vulgaris) is used as fodder, and yields about 10 tons per acre. Sugar beet is extensively grown to supply the sugar factories. The output in 1905 was 4.940,000 tons. The area occupied is 0.15 million acres, with an output of 9,916,000 tons.

Market gardening is carried on both in town and village, and comprises works that produce ready sale, and along the greater part of the coast, an account of transport facilities. Rome is an exception to the former rule, and imports garden produce largely from the neighbourhood of Naples and Sardinia.

Among the chief industrial plants is tobacco, which grows wherever suitable conditions are met, in Italy,motion by which it is a government monopoly. Its cultivation is subject to official concessions and prescriptions. Experiments have shown that the cultivation of Oriental tobacco may be profitably extended in Italy. The yield for 1901 was 15,000 tons, of which 12,000 were consumed at home. It is grown chiefly in the provinces of the Po valley, and in some parts of the south, especially in the province of Taranto.

The chief textile plants are hemp, flax, and cotton. Hemp is largely cultivated in the provinces of Turin, Ferrara, Bologna, and elsewhere. Flax covers about 160,000 acres, with a fibre, amounting to about 20,000 tons. Cotton (Gossypium herbaceum), which at the beginning of the 19th century, at the time of the Continental blockade, was a source of great wealth, is now cultivated in many parts of Italy, and its production is increasing yearly. The chief cotton-growing provinces are Lombardei, Emilia, and Puglia.

Silkworm-rearing is carried on a large scale in the provinces of Tuscany, Calabria, and Sicily. Italy is one of the leading silk-producing countries, and the production of silk in the year 1906 was about 23,000,000 lb. The cultivation of silk production is carried on in the provinces of Turin, Modena, and Reggio. The production of silk in the year 1906 was about 23,000,000 lb. The cultivation of silk production is carried on in the provinces of Turin, Modena, and Reggio. The production of silk in the year 1906 was about 23,000,000 lb. The cultivation of silk production is carried on in the provinces of Turin, Modena, and Reggio. The production of silk in the year 1906 was about 23,000,000 lb. The cultivation of silk production is carried on in the provinces of Turin, Modena, and Reggio. The production of silk in the year 1906 was about 23,000,000 lb.

The cultivation of oranges, lemons, and their congeners (collectively designated in Italian by the term agrumi) is of comparatively modern date. The introduction of the Citrus bergadana is probably due to the Arabs. Sicily is the chief centre of cultivation—the area occupied by lemon and orange orchards in the province of Palermo alone having increased from 11,525 acres in 1884 to 54,340 in 1873. Reggio Calabria and Caserta are the continental provinces which come next after Sicily. In Sardinia the cultivation is extensive, but receives little attention. Both crude and concentrated lime-juice is exported, and essential oil is obtained from the leaves. The chief centre of cultivation is that of the lemon and the bergamot. In northern and central Italy, except in the province of Brescia, the agrumi are almost non-existent. The trees are planted on irrigated soil and the fruit gathered between November and January. A large proportion of the juice is used for making lemon oil, which is used in the manufacture of perfume. The juice is also used in the preparation of food, but the amount is decreasing.

The cultivation of oranges, lemons, and their congeners (collectively designated in Italian by the term agrumi) is of comparatively modern date. of importance now exist in the Marches, Umbria, in the Abruzzi, Tuscany, Piedmont, and Venetia. The chief silk-producing provinces are Lombardy, Venetia and Piedmont. During the period 1900–1904 the average annual production of silk cocoons was 33,500 tons, and of silk, 30,000,000 yards.

The great variety in physical and social conditions throughout the peninsula gives corresponding variety to the methods of agriculture. In the rotation of crops there is an amazing diversity—shifts of two or three years in the order of crops, and sometimes whatever order strikes the fancy of the farmer. The fields of Tuscany for the most part bear wheat one year and maize the next, in perpetual interchanges, relieved to some extent by green crops. A similarly frequent change is seen in the agricultures of the Salerno, Benevento and Avellino. In Lombardy a six-year period is common: either wheat, clover, maize, rice, rice (the last year manured with lupines) or maize, wheat followed by clover, clover, clover, and, finally, wheat. The interchanges of crops are particularly common in the Emilian region, which has the disadvantage of the grain crops succeeding each other, and the use of green manures. The use of fallow is widely adopted, the ground often being left in this state for fifteen or twenty years; and in some parts of Sicily there is a regular interchange of fallow and crop year by year. The following scheme indicates a common Sicilian method of a type which has been extensively exported. For each of these six systems, two divisions of the region following the same order, but beginning respectively with the two years of grain and the two of pasture.

Woods and forests play an important part, especially in regard to the pasturing of the soil. In regions where tropical crops, such as the chestnut of Italy, are produced, the average area cultivated is about 14.3% of the total, and of the chestnut-woods 1.9% more; and its products in 1886 were valued at £5,520,000 (not including chestnuts). A quantity of it is really bushwood, used for the manufacture of charcoal and firewood. As for agriculture, it has been estimated that the farmers of the provinces, the communes, and the owners or other private individuals directly interested.

The Italian Federation of Agrarian Unions has greatly contributed to the efficiency of farming and the exportation of agriculture, and fixed schools of viticulture, also do good work. Some unions annually purchase large quantities of merchandise for their members, especially chemical with the use of machinery amounted to 10,000 tons in 1901.

DRAINAGE

The drainage of marshy and marshy lands has considerably extended. A law passed on the 22nd of March 1900 gave a special impulsion to this form of enterprise by fixing the ratio of the cost of the work in proportion to the extent of the area to be drained. The work is shared between the provinces, the communes, and the owners or other private individuals directly interested.

The Italian Federation of Agrarian Unions has greatly contributed to the efficiency of farming and the exportation of agriculture, and fixed schools of viticulture, also do good work. Some unions annually purchase large quantities of merchandise for their members, especially chemical with the use of machinery amounted to 10,000 tons in 1901.
of the more open districts; but in Italy generally, and especially in Sardinia, the land is very much subdivided. The following forms of contract are most usual in the several regions: In Piedmont the messadria (metayage), the tiedseria, the colonia pastoria, the boaia, the messadria a basta, the sponges, the mezzadria, and the leasehold contracts. In Sicily the leasehold contracts generally last three years. Products are usually divided in equal proportions between the owner and the tiller. The owner pays the taxes, defrays the cost of preparing the ground, and is paid a share, half of which is an added rent, paid by the tiller, and, even if kept on the half-and-half system, is usually bought by the tenant. The peasant, or mezzadria, provides labour. Under tiedseria the owner furnishes stock, implements and seed, and the tiller retains only one-third of the principal products. In Lombardy, besides the messadria, the lease is common, but the tiedseria is rare. The lessee, or farmer, tills the soil at his own risk; usually he provides live stock, implements and capital, and has no right to any portion of the produce. The landlord executes all the agricultural work, in return for which he is housed rent-free, and receives one-sixth of the corn, one-third of the maize and has a small money wage. This contract is usually renewed from year to year. The boaia is usually restricted to its two forms of tenancy: free and landlord. In the former case a peasant family undertakes all the necessary work in return for payment in money or kind, which varies according to the crop; in the latter the money wages and the payment in kind are fixed by lease. In the case of the free leasehold contract, the landlord pays the tenant the sowing of corn. There are various categories of inquilinaggio, according to rent is paid in money or in kind. Under messadria or metazateria the landlord divides the produce with the farmer in half. Some of the forms of tenancy in Italy are limited to the neighbourhood of Naples. For sponge fishing and mussel-collecting a special form of contract, the bower or bowaria, is in existence. In the marche, Umbria and Tuscany, mezzadria prevails in its purest form. Profits and losses, both in regard to produce and stock, are equally divided between the landlord and tenant. In Liguria, and to a much smaller extent in Calabria, the landlord and tenant share two-thirds of the olives and the whole of the grapes and the mulberry leaves. Leaseshold exists in the province of Grosseto alone. In Latium leasehold and farming by landlords prevail, but cases of messadria are not unknown. The value of a mezzadria contract in 1895 was about 1,700 lire; in the case of a boaia or zone immediately around Rome, land is as a rule left for pasturage. It needs, therefore, merely supervision by guardians and mounted overseers, or butleri, who are housed and receive wages. Large landed proprietors who are occupied with extensive agricultural operations and manage the estates, but the estate is often let to a middleman, or mercante di campagna. Wherever corn is cultivated, leasehold predominates. Much of the work is done by serfs, a form of bondage which, under various names, exists in the provinces of Foggia and Lecce long leases (up to twenty-nine years) are granted, but in them it is usual for water to be paid according to the crop. In Sicily, the landlord takes half the produce, except that of the olive, vine, tree and woods, which he leases separately. "Improvement contracts" also exist. The tenant is commonly paid by a share of the produce, but since 1892 the costs of improvements and buildings farms-houses; also leases of orange and lemon gardens, two-thirds of the produce of which goes to the landlord, while the farmer contributes half the cost of farming the garden. A leasehold varying from four to six years for crops, is a form of contract similar to the boaia, but applied principally to large holdings. The wages are lower than under the boaia. In the affitto, or lease, the proprietor furnishes seed and the implements, and the tenant pays a fixed rent in return for the produce. The Lombard messadria contracts taxes are paid by the cultivator.
was employed. Sardine coral commands from £3 to £4 per kilogramme (2-20 lb) and is much more valuable than the Sicilian coral. The S. lucasa reefs were again closed for three winters by a decree of 1904. The fishing is largely carried on by boats from Torre del Greco, the waters of which cover considerable areas, and the coral beds are now exhausted. In 1879-1900 men were employed; in 1920 only about 30. In 1902 there were 48 tunny fisheries, employing 3000 men, and 5166 tons of fish worth £80,000 were caught. The main fisheries in the Mediterranean are that of the sea-sardines, and as the sardine-fishing (the products of which are reckoned among the general total) are also of considerable importance, especially along the Ligurian and Tuscan coasts. The lagoon fisheries are also of great importance, most especially in the lagoon of Orbetello and the笑话 of Pietrelungo and Piccolo Montale at Taranto. The deep-sea fishing boats in 1902 numbered 1368, with a total tonnage of 16,149. 100 of these were coral-fishing boats and 111 sponge-fishing boats.

Industrial Progress.—The industrial progress of Italy has been great since 1886. Many articles formerly imported are now made at home, and some Italian manufactures have begun to compete in foreign markets. Italy has only unimportant lignite and antracite mines, but water power is abundant and has largely applied to industry, especially in generating electricity. The electric power required for the tramways and the illumination of Rome is entirely supplied by turbines situated at Trevoli, and this is the case elsewhere, and the harnessing of this water-power is capable of very considerable extension. A sign of industrial development is to be found in the growing number of manufacturing companies, both Italian and foreign.

The chief development has taken place in mechanical industries, though it has also been marked in metallurgy. Sulphur mining has extended in consequence of the construction of the trans-Apennine iron and coal tramway. The manufacture of coal and lignite has increased in spite of American competition. Very little pig iron is made, most of the iron ore being exported, and iron manufactured consists of old iron remelted. For steel-making foreign pig iron is chiefly used. Copper, produced in the Cisalpine province of Brescia, is also employed. Gardens, rails, carrying on first at Terni and afterwards at Savona, began in Italy in 1886. Tin has been manufactured since 1892. Lead, antimony, mercury and copper are also produced. The total salt produced in 1920 was 54,047 tons, of which 10,510 were sold in the government salt factories and the rest in the free salt works of Sicily. Great progress has been made in the manufacture of machinery; locomotives, railway carriages, electric tram-cars, &c., of which the country has a considerable demand. The steel and iron manufactures of Italy are chiefly carried on in the north and in the neighbourhood of Naples. At Turin the manufacture of motor-cars has attained great importance and the F.L.A.T. (Fabbrica Italiana Automobili Torino) factory employs 2000 workmen, while eight others employ 250 amongst them.

The textile industries, some of which are of ancient date, are among those that have most rapidly developed. Handlooms and small spinning establishments have, in the silk industry, given place to large factories. The value of raw silk at least tripled itself between 1875 and 1900, and the value of the silks woven in Italy, estimated in 1890 to be £2,000,000, is now, on account of the development of the export trade, calculated to be about £4,000,000. Linen and hemp are produced on the Alps, and Piedmont and Venetia are the chief silk-producing regions. There are several public assay offices in Italy for silk; the first in the world was established in Turin in 1750. The cotton industry has also rapidly developed, the cotton produced chiefly in and around the Po valley, the principal branches of the cotton industry which in 1885 was calculated to be £2,000,000, was in 1900, notwithstanding the fall in prices, about £12,000,000. The industry is chiefly developed in Lombardy, Piedmont and Liguria; to some extent also in Tuscany, Venetia, and the Marches. Industrial growth has been greater in the Marches, Umbria, and Abruzzi and Sicily. A government weaving school was established in Tuscany in 1906. As in the case of cotton, Italian woolen fabrics are conquering the English market in increasing degree. The industry is chiefly located in Tuscany (Florence), Lombardy (Brescia), Campania (Caserta), Genoa, Umbria, the Marches, and Rome. To some extent the industry also exists in Emilia, Calabria, Basilicata, the Abruzzi, Umbria, and Sicily. It has, however, a comparatively small export trade.

The other textile industries (flax, jute, &c.) have made notable progress. The jute industry is concentrated in a few large factories, which, in 1900, employed 6000 workmen, and have more than supplied the home market, and have begun considerably to export.

Chemical industries show an output worth £4,620,000 in 1902 as against £1,080,000 in 1893. The chief products are sulphuric acid and paper. The manufacture of paper is becoming combined in most of the older factories, and the production of paper is now quite, in supplying not only the whole Italian market but an export trade.

The match-making industry is subject to special fiscal conditions. In 1902-1903 there were 219 match factories scattered throughout Italy, employing 10,378 workmen, and producing £1,963,000 of goods.

The number of silk factories has been reduced to less than half since 1897 by the suppression of smaller factories, while the production has increased from 47,690 millions to 93,741 millions.

Artificial sugar has obtained considerable proportions in Umbria, the Marches, Lazio, Venetia and Piedmont since 1890. In 1898-1899, 5972 tons were produced, while in 1905 the figure had risen to 93,916. The rise of the industry has been favoured by the high duties on sugar and the tax of excise which allows a considerable premium to manufacturers.

Alcohol has undergone various oscillations, according to the legislation governing distilleries. In 1871 only 206 distilleries were in operation, which in 1887 had increased to 2780, and in 1905 the maximum hitherto attained. Since then special laws have hampered development, some provinces, as for instance Sardinia, being allowed to manufacture for their own consumption but not for export. In these provinces the industrial output has been increased at the expense of duty. The average production is about 180,000 hectolitres per annum. The greatest quantity is produced in Lombardy, Piedmont, Venetia and Tuscany. The quantity of beer is about the same, the greater part of the beer drunk being imported from Germany, Austria and Switzerland. Beer is made both for export and for domestic consumption. The leading centre of beer production is the district of Ferno, in the Alpine villages of the province of Vicenza, and in some communes of the province of Messina. The plaiting is done by country women, while the hats are made up in factories.

Bamboo, cocoons, and rubber are manufactured in Venetia, and the principal industry is that of the Trevisi, who manufacture both rubber goods and cocoons, and are supplied with the rubber for the making of the rubber goods. In the district of Ferno, in the Alpine villages of the province of Vicenza, and in some communes of the province of Messina. The plaiting is done by country women, while the hats are made up in factories.

Tobacco is entirely a government monopoly; the total amount manufactured in 1902-1903 was 16,999 tons—a fairly constant figure.

The finest glass is made in Tuscany and Venetia; Venetian glass is of the best quality in the world. In the various ceramic arts Italy was once unrivalled, but the ancient tradition for a long time lost its primeval impulse. The works at Vinovo, which had fame in the 18th century, and others of the same character, those of Castelli (in the Abruzzi), which have been revived, were supplanted by Charles III.'s establishment at Capodimonte, 1790, which after preparing articles of surprising execution was closed down in 1816. Since then the works at Della Doccia works at Florence. Founded in 1735 by the marquis Carlo Ginori, they maintained a reputation of the very highest kind down to about 1860; but since then they have not kept pace with the new art, and the older works have been replaced by the most modern establishments in the country.

The weaving of tiles and common wares—called trevi—has been largely exported, although the making of tiles and common wares are generally still in use. The production of mosaics is an industry still carried on with much success in Italy, which indeed ranks exceedingly high in the

ITALY [MECHANICAL INDUSTRIES]
department. The great works of the Vatican are especially famous (more than 17,000 distinct tints are employed in their productions), and there are many other establishments in Rome. The Florentine mosaics are perhaps better known abroad; they are composed of larger pieces than the Roman. Those of the Venetian artists are remarkable for the boldness of their colouring. There is a tendency generally towards the fostering of feminine home industries—lace-making, linen-weaving, &c.

**Condition of the Working Classes.**—The condition of the numerous agricultural labourers (who constitute one-third of the population) is, except in some regions, hard, and in places absolutely miserable. Much light was thrown upon their position by the agricultural inquiry (inchiesta agraria) completed in 1884. The large numbers of emigrants, who are drawn chiefly from the rural classes, furnish another proof of poverty. The terms of agrarian contracts and leases (except in districts where mezzadria prevails in its essential form), are in many regions disadvantageous to the labourers, who suffer from the obligation to provide guarantees for payment of rent, for repayment of seed corn and for the division of products.

It was only at the close of the 19th century that the true cause of malaria—anapheles claviger—was discovered. This majoquito does not as a rule enter the large towns; but low-lying coast districts and ill-drained plains are especially subject to it. Much has been done in keeping out the miasma by the milesing placed on the windows and the doors of houses, especially in the fishermen’s cottages. In 1902 the state took up the sale of quinine at a low price, manufacturing it at the central military pharmaceutical laboratory at Turin. Statistics show the difference produced by this measure.

The profit made by the state, which is entirely devoted to a special fund for means against malaria, amounted in these years to £41,759. It has been established that two 3-grain pastilles a day are a sufficient prophylactic; and the proprietors of malarial estates and contractors for public works promised to supply enough quinine at a low price, sufficient quinine for their workmen, death for want of this precaution coming under the provisions of the workmen’s compensation act. Much has been done, though much remains to be done, in the way of beneficentitio, i.e. prophylactic. The increase of the (generally fertile) low-lying and hitherto malarious plains.

In Venetia the lives of the small proprietors and of the salaried peasants are often extremely miserable. There and in Lombardy the disease known as pellagra is most widely diffused. The disease is due to poisoning by micro-organisms produced by deteriorated maize, and can be combated by care in ripening, drying and storing the maize. The most recent statistics show the disease to be diminishing. Where there were 104,667 (16-29 per 1000) peasants afflicted by the disease, in 1899 there were only 72,603 (10-30 per 1000) peasants, with a maximum of 39,882 (34-32 per 1000) peasants in Venetia, and 19,557 (12-90 per 1000) peasants in Lombardy. The decrease of the disease is a direct result of the efficient efforts made to combat it, in the form of special hospitals or pellagrosari, economic kitchens, rural bakeries and maize-drying establishments. A bill for the better prevention of pellagra was introduced in the spring of 1902. The deaths it dropped in that year to 2376, from 3054 in the previous year and 3788 in 1900.

In Liguria, on account of the comparative rarity of large estates, agricultural labourers are in a better condition. Men earn between 15. 5d. and 2s. 1d. a day, and women from 3d. to 8d. In Emilia the day labourers, on account of their as diurnarii, or day-wage men, earn, on the average, low wages, out of which they have to provide for shelter and to buy by something against unemployment. Their condition is miserable.

In Tuscany, however, the prevalence of mezzadria, properly so called, has a bad influence on the labourers’ condition. We have some Tuscan provinces, as, for instance, that of Grosseto, where malaria ravages, labourers are organized in gangs under “corporals,” who undertake work. They are poverty-stricken, and easily fall victims to disease, and are few in number. The time men are engaged by the year. The curatori or curatoli (factors) receive £30 a year, with a slight interest in the profits; the stockmen hardly earn in money and kind £15; the muleteers and under-workmen get between £5 to £8, plus firewood, bread and oil; irregular workmen have even lower wages, with a daily distribution of bread, salt and oil. In Campania and Calabria the curatori and massaeri earn in money and kind, about £12 a year; cowmen, shepherds and muleteers about £10; irregular workmen are paid from 8d. to 15. 9d. per day, but only find employment, on an average, 230 days in the year. The condition of Sicilian labourers is also miserable. The huge extent of the latifondi, or large estates, often results in their being left in the hands of speculators, who work the land at a penny a stroke, for which the latter are often compelled, at the end of a scant year, to hand over their crops to the usurers before harvest. In Sardinia wage-earners are paid 10d. a day, with free shelter and an allotment for private cultivation. Irregular adult workmen earn between 10d. and 15. 9d. per day, and from 6d. to 10d. per day for muleteers and waterers, however, sometimes earn as much as 38. 9d.

The peasants somewhat rarely use animal food—this is most largely used in Saradina and least in Sicily—bread and polenta or macaroni and fish being the staple food. We have the same in Friuli.

The condition of the workmen employed in manufactures has improved during recent years. Wages are higher, the cost of the prime necessities of life is, as a rule, lower, though taxation on some of them is still enormous; so that the remuneration of work has improved. Taking into account the variations in wages and in the price of wheat, it may be calculated that the number of hours of work requisite to earn a sum equal to the price of a cwt. of wheat fell from 183 in 1871 to 73 in 1894. In 1886 it was 105, on account of the rise in the price of wheat, and since then up till 1902 it oscillated between 105 and 95.

Wages have risen from 22-6 centimes per hour (on an average) to 26-3 centimes, but not in all industries. In the mining and woolen industries they have fallen, but have increased in mechanical, chemical and glass, and are considerably different in different parts of Italy, according to the cost of the necessities of life, the degree of development of working-class needs and the state of working-class organization, which in some places has succeeded in bringing about a rise in wages, while in others the rates of wages have fallen. There is a notable rise in the wages of men, and though their wages have also increased, the rise has been slighter than in the case of men. In some trades, for instance the silk trade, women earn little more than 10d. a day, and, for some day-struck work, as little as 10d. a day. The improvement in sanitation has led to a corresponding improvement in the condition of the working classes, though much still remains to be done, especially in the south. On the other hand, it is generally the case that even in the most prosperous the bread is being sold at a high price.

The number of industrial strikes has risen from year to year, although, on account of the large number of persons involved in some of them, the rise in the number of strikers has not always corresponded to the number of strikes. During 1901 the years 1900 and 1901 strikes were increasingly numerous, chiefly on account of the growth of Socialist and working-class organizations.

The greatest proportion of strikes takes place in northern Italy, especially Lombardy and Piedmont, where manufacturing industries are most highly developed. This is also the region which has the highest percentage of strikes, since they give employment to large numbers of men concentrated in single localities. Agricultural strikes, though less frequent than those in manufacturing industries, have been, on the whole, more frequent in the north and centre, a circumstance which shows them to be promoted less by the more backward and more ignorant peasants than by the better-educated labourers of Lombardy and Emilia, among whom Socialist organizations are widespread. Since 1901 there have been, more than once, general strikes at Milan and elsewhere, and one in the autumn of 1905 caused great inconvenience throughout the country, and led to no effective result.

Although the working-men’s movement has assumed an importance equal to that of other countries, there is no general working-class organization comparable to the English trade unions. Mutual benefit and co-operative societies serve the purposes of the working-men, and there are not more than 500,000 employers.

In 1893, after many vicissitudes, the Italian Socialist Labour Party was founded, and has now become the Italian Socialist Party, in which the majority of Italian workmen enrol themselves. Printers and hat-makers, how at first, have been, and are, the leaders of agitation. The organization for the formation of “Chambers of Labour,” intended to look after the technical education of workmen and to form commissions of arbitration in case of strikes. They act also as employment bureaux, and are often centres of political propaganda. At several different times they have discussed the question of “socialism of improvement,” or of “resistance,” are rapidly spreading in the country districts. In many cases the action of these organizations has proved, at least temporarily, advantageous to the working classes. It has led to the late development of manufacturing industry and of working-class organization. On the 17th of April 1898 a species of Employers’ Liability Act compelled employers of more than five workers in certain industries to insure their employees against accidents.
On the 17th of July 1898 a national fund for the insurance of workmen against illness and old age was founded by law on the principle of optional registration. In addition to an initial endowment by the state, part of the annual income of the fund is furnished in various forms of deposits voluntarily by making over a proportion of the profits of the Post Office Savings Bank, and part by the premiums of the workmen. The minimum annual premium is six lire for an annuity of one lira per day at the age of sixty, and insurance against sickness is not opened for at any age under 15. The payments were established on Sunday in every case in which it was possible, and otherwise upon some other day of the week.

The French institution of Prud'hommes, which was introduced into Italy in 1862, under the name of Commissions di Mutuo Soccorso, was not established on Sunday in every case in which it was possible, and otherwise upon some other day of the week.

especially in the province of Turin, and in other regions of northern and central Italy. In the south they are rare, on account partly of the mountainous character of the country, and partly of the scarcity of traffic. All the important towns of Italy are provided with internal electric railways, with others connecting with the main lines.

Carriage-roads have been greatly extended in modern times, although their ratio to area varies in different localities. In northern Italy there are 1480 yds. of road per sq. m.; in central Italy 993; in southern Italy 405; in Sardinia 596, and in Sicily only 244. They are more numerous in the north than in the south, where, especially in Calabria, many villages are inaccessible by road and have only footpaths leading to them. By the act of 1903 the state contributes half and the province a quarter of the cost of roads connecting communes with the nearest railway stations or landing points.

Inland Navigation.—Navigable canals had in 1886 a total length of about 655 m.; they are principally situated in Piedmont, Lombardy and Venetia, and are thus practically confined to the Po basin. Canals lead from Milan to the Ticino, Adda and Po. The Po is itself navigable from Turin downwards, but through its delta it is so sandy that canals are preferred, the Po di Volano and the Po di Primaro on the right, and the Canale Bianco on the left. The total length of navigable canals in Italy is 1,087 m.

Posts, Telegraphs and Telephones.—The number of post offices (including colletorie, or collecting offices, which are rapidly being eliminated) increased from 2200 in 1862 to 4285 in 1881, 6760 in 1891 and 9144 in 1904. The number of telegrams in 1881 was 340,000; of letters and post cards (i.e. nearly 10 per inhabitant per annum in 1894, as against 5-65 in 1888) the average is considerably below that of most other European countries. The number of state telegraphs is 31,000 in 1881, of which 3,400 were private, and 17,500 lines for intercommunication, such as from Rome to Paris, and Italy and Switzerland also exists. The parcel post and money order services have largely increased since 1887-1888, the number of parcels having almost doubled (those for abroad are more than trebled), while the number of money orders has increased by treble, and their value doubled (about £40,000,000). The value of the foreign orders paid in Italy increased from £1,280,000 to £2,356,000—owing to the increase of emigration and of the savings sent home by emigrants.

At the census of 1907 Italy was among the few countries that had not adopted the reduction of postage sanctioned at the Postal Union congress, held in Rome in 1906, by which the rates became 2½d. for the first oz., and 1½d. per oz. afterwards. The internal rate is 1½d. (1d. for 600 oz. and 1½d. for 1 oz. and 1½d. per oz. afterwards. The other rates (in the postal district are as follows: 6d. (1½d.) per oz., and 1½d. for 50 grammes (1 oz.). The regulations provide that if there is a greater weight of correspondence (including book-packets) than ½ lb for any individual by any one delivery, notice shall be given to him, and he shall be obliged to arrange for fetching it. Letters insured for a fixed sum are not delivered under any circumstances.

Money order cards are very convenient and cheap (up to 10c. for 10c. 1st class, and 15c. for 10c. 2nd class), and a short message can be written on them. Owing to the comparatively small amount of letters, it is found possible to have a travelling post office on all principal trains (while almost every train has a travelling sorter, for whom a compartment is reserved) without a late fee being exacted in either case. In the principal towns letters may be posted in special boxes at the head office just before the departure of any given mail train, and are conveyed directly to the travelling post office on the next train. Mail conveyed in this manner is not subject to duty, and the letter-boxes on electric trams are in some towns provided.

Maritime Trade.—Between the years 1881 and 1905 the number of ships entered and cleared at Italian ports has increased slightly (216,598 in 1881 and 298,737 in 1905), while their aggregate tonnage has increased (32,274,000 in 1881 and 39,905,000 in 1905). The average rate of increase of shipping, trade with foreign countries prevails (especially as regards arrivals) over trade between Italian ports. Most of the merchandise and passengers bound for and hailing from foreign ports sail under foreign flags. Similarly, foreign vessels prevail over Italian vessels in regard to goods embarked. European countries absorb the greater part of Italian sea-borne trade, whereas most of the passenger traffic goes to North and South America. The substitution of foreign for Italian shipping is bringing about a diminution in the number of vessels belonging to the Italian mercantile marine, whether employed in the coasting trade, the fisheries or in traffic on the high seas.

Among the steamers the increase has chiefly taken place in vessels of more than 1000 tons displacement, but the number of sailing vessels has also increased. The most important Italian ports are (in order): Genoa, Naples, Palermo, Leghorn, Messina, Venice, Catania.

Foreign Trade.—Italian trade with foreign countries (imports and exports) during the quinquennium 1872-1876 averaged £49,000,000 a year; in the quinquennium 1893-1897 it fell to £83,000,000 a year. In 1898, however, the total rose to £104,000,000, but the increase was more than offset by an extra import of corn in that year. In 1899 it was nearly £120,000,000. Since 1899 there has been a steady increase both in imports and exports. Thus:

1 No account has here been taken of fluctuations of exchange.

The great extension of Italian coast-line is thought by some to be not really a source of strength to the Italian mercantile marine, as few of the ports have a large enough hinterland to provide them with a traffic, and there are many more than they can handle. There is no lack of canals or navigable rivers. Another source of weakness is the fact that Italy is a country of transit and the Italian mercantile marine has to enter into competition with the ships of other countries, which can carry the goods of many more countries, and have much larger tonnage and volume of Italian exports relatively to the imports, and in the former in 1905 being about one-fourth of the latter, and greatly out of proportion to the relative value; while a fourth is the lack of facilities for handling goods, especially in the smaller ports. The total imports for the first six months of 1906 amounted to £57,840,000, an increase of £7,520,000 as compared with the corresponding period of 1905. The diminution was due to a smaller importation of raw silk and oil. The countries with which this trade is mainly carried on are: (exports) United Kingdom, Germany, United States, France, Russia and India; (imports) Switzerland, United States, Germany, France, United Kingdom and Argentina.

The most important imports are minerals, including coal and metals (both in pig and wrought): silks, raw, spun and woven; stone, potter's earth, earthenware and glass; corn, flour and macaroni; various products: rose oil, cotton and tobacco, raw, spun and woven; and live stock. The principal exports are silk and manufactured silk, cotton and cotton manufactures, live stock, wine, spirits and oils; corn, flour, macaroni and similar products; and minerals, chiefly sulphur. Before the tariff reform of 1887 manufactured articles, alimentary products and raw materials for manufacture held the same position as they now do. Before the tariff reform many raw materials for manufacture and manufactured articles were little account. The transformation of Italy from a purely agricultural into a largely industrial country is shown by the circumstance that in 1887 the quantities of raw materials required in the production of manufactured and manufactured materials, now preponderate over that in alimentary products and wholly-manufactured articles, both the importation of raw materials and the exportation of manufactured articles, which are under the same circumstances.

The large predominance of imports over exports after 1885 was a result of the falling off of the export trade in live stock, olive oil and wine, on account of the closure of the olive market, while the importation of corn from Russia and the Balkan States increased, and the former of exports over imports fell to £2,720,000, but by 1898 it had grown to £8,391,000, in consequence chiefly of the increased importation of coal, raw cotton and cotton manufactures, pig and cast iron, old iron, grease and oil seeds for use in the Italian trade. The excess of imports over exports fell to £3,006,000; but since then it has never been less than £12,000,000.

Education.—Public instruction in Italy is regulated by the state, which maintains public schools of every grade, and requires that other public schools shall conform to the rules of the state schools. No private person may open a school without state authorization. Schools may be classified thus:

1. Elementary, of two grades, of the lower of which there must legally be at least one for boys and one for girls in each commune, in which the upper grade is the common qualification required in communes having normal and secondary schools or over 4000 inhabitants. In both the instruction is free. They are maintained by the communes, sometimes with state help.
The age limit is six to nine years for the lower grade, and up to twelve for the higher grade, attendance being obligatory at the latter also where it exists. 2. Secondary instruction (i) classical in the ginasi and licei, the latter leading to the universities; (ii) technical. 3. Higher education—universities, higher institutes and special schools.

Of the secondary and higher educatory methods, in the normal schools and licei the state provides for the payment of the staff and for scientific material, and often largely supports the ginasi and technical schools, which should by law be supported by the communes. The universities are maintained by the state and by their own ancient resources; while the higher special schools are maintained conjointly by the state, the province, the commune and sometimes the local chamber of commerce.

The number of persons unable to read and write has gradually decreased, both absolutely and in proportion to the number of inhabitants. The census of 1871 gave 73% of illiterates, that of 1891, 67%, and that of 1901, 56%, i.e. 51.8 for males and 60.8 for females. In Piedmont there were 17.7% of illiterates above six years (the lowest) and in Calabria 78.7% (the highest), the figures for the whole country being 48.5. As might be expected, progress has been most rapid wherever education at the command of national unification, was most widely diffused. For instance, the number of bridegroom's unable to write their names in 1872 was in the province of Turin 26%, and in the Calabrian province of Cosenza 90%; in 1899 the percentage in the province of Turin had fallen to 5%, while in that of Cosenza it was still 76%. Infant asylums (where the first rudiments of instruction are imparted to children between two and a half and six years of age) and elementary schools have increased in number. There has been a corresponding increase in the number of scholars. Thus—

</tbody>
</table>

The teachers in 1901-1902 numbered 65,739 (exclusive of 576 non-teaching directors and 322 teachers of special subjects) or about 41.5 scholars per teacher.

The rate of increase in the public state-supported schools has been more than ten times that in private schools. School buildings have been improved and the qualifications of teachers raised. Nevertheless, many schools are still defective, both from a hygienic and a teaching point of view; while the economic position of the elementary teachers, who in Italy depend upon the communal administration and not upon the state, is still in many parts of the country extremely low.

The law of 1877 rendering education compulsory for children between six and nine years of age has been the principal cause of the spread of elementary education. The law is, however, imperfectly enforced for financial reasons. In 1901-1902 only 65% out of the whole number of children between six and nine years of age were registered in the lower standards of the elementary and private schools. Even evening schools could extend the spread of education. Their number and that of their scholars have, however, decreased since the withdrawal of state subsidies. In 1871-1872 there were 376,947 scholars at the evening schools and 154,854 at the public schools in the city, while in 1890-1901 these numbers had fallen to 94,510 and 35,460 respectively. These are, however, only the institutions in which a decrease is shown, and by the law of 1906 5000 of these institutions are to be provided in the communes where the proportion of illiterates is highest. In 1895 they numbered 4455 with 135,181 scholars. Regimental schools impart elementary education to illiterate soldiers. Whereas the levy of 1894 showed 40% of the recruits to be completely illiterate, only 27% were illiterate when the levy was discontinued in 1897. Private instruction and working-class associations have striven to improve the intellectual conditions of the working classes. Popular universities have lately attained considerable development. The number of institutes devoted to secondary education remained almost unchanged between 1860-1881 and 1895-1896. In some places the number has even been diminished by the suppression of private educational institutes. But the number of scholars has considerably increased, and shows a ratio superior to the general increase of the population. The greatest increase has taken place in technical education, where it has been much more rapid than in classical education. There are three higher commercial schools, with academic rank, at Venice, Genoa and Bari, and eleven secondary commercial schools; and technical and commercial schools for women at Florence and Milan. The number of agricultural schools has also grown, although the total is relatively small when compared with population. The attendance at the various classes of secondary schools in 1882 and 1902 is shown by the following table:

1896.

The schools which do not obtain equality with government schools are either some of those conducted by religious orders, or else those in which a sufficient standard is not reached. The total number of such schools was, in 1901-1902, 33,815 pupils.

The pupils of the secondary schools reach a maximum of 6-60 per cent in Lucania and 5-92 in Latium, and a minimum of 2-30 in the Abruzzi, 2-27 in Calabria and 1-65 in Basilicata.

For the boarding schools, or convitti, there are only incomplete reports except for the institutions directly dependent on the ministry of public instruction, which are comparatively few. The rest are largely directed by religious institutions. In 1895-1896 there were 919 convitti for boys, with 59,066 pupils, of which 49, with 3814 pupils, were dependent on the ministry (in 1901-1902 there were 43 of them, with 4270 pupils); and 1456 for girls, with 49,576 pupils, of which only 8, with 500 pupils, were dependent on the ministry.

The scuole normali or training schools (117 in number, of which 75 were government institutions) for teachers had 1329 male students in 1901-1902, showing hardly any increase, while the female students increased from 806 in 1882-1883 to 22,316 in 1895-1896, but decreased to 19,044 in 1901-1902, owing to the admission of women to telegraph and telephone work. The female secondary schools in 1881-1882 numbered 77, of which 7 were government institutions, with 3569 pupils; in 1901-1902 there were 233 schools (9 government) with 9347 pupils.

The total attendance of students in the various faculties at the different universities and higher institutes is as follows:

ITALY

The great majority of Italians—97-12%—are Roman Catholics. Besides the ordinary Latin rite, several others are recognized. The Armenians, Venetians, and Turkish (Trabzonese) Albanians of the southern provinces still employ the Greek rite and the Greek language in their public worship, and their priests, like those of the Greek Church, are allowed to marry. Certain peculiarities introduced by St Ambrose distinguish the ritual of Milan from that of the general church. Up to 1871 the island of Sicily was, according to the bull of Urban II., ecclesiastically dependent on the king, and exempt from the canonical power of the pope.

Though the territorial authority of the papal see was practically abolished in 1870, the fact that Rome is the seat of the administrative centre of the vast organization of the church is not without significance to the nation. In the same city in which the administrative functions of the body politic are centralized

The patrimony of Italian charitable institutions is considerable and is constantly increasing. In 1880 the number of charitable institutions (exclusive of public pawnshops, or Monti di Pietà, and other institutions which combine operations of credit with charity) was approximately 22,000, with an aggregate patrimony of nearly £8,000,000. The revenue was about £3,600,000; after deduction of taxation there remained for distribution about £2,700,000. Adding to this £1,240,000 of communal and provincial subsidies, the product of the labour of inmates, temporary subscriptions, &c., the net revenue available for charity was, during 1880, £3,860,000.

Charitable institutions take, as a rule, the two forms of outdoor and indoor relief and attendance. The indoor institutions are the larger of the two. In regard to endowment, and consist of hospitals for the infirm (a number of these are situated at the seaside); of hospitals for chronic and incurable diseases; of orphan asylums; of poorhouses and shelters for beggars; of infant asylums or institutions for the first care and instruction of infants, of general or of special asylums for the aged, of lunatic asylums; of homes for the deaf and dumb; and of institutes for the blind. The outdoor charitable institutions include those which distribute help in money or food; those which supply medicine and medical help; those which aid mothers unable to rear their own children; those which subsidize orphans and foundlings; those which subsidize educational institutes; and those which supply marriage portions. Between 1881 and 1890 the chief increases took place in the endowments of hospitals; orphan asylums; infant institutions; those which subsidize charitable institutions, and institutes for the blind. The least creditably administered of these are the asylums for abandoned infants; in 1887, of a total of 23,913, 53.7% died; while during the years 1893-1896 (no later statistics are available) 59.1% died. In Italy, pauperism under one year for the whole of Italy in 1893-1896 was only 16.6%.

Italian charity legislation was reformed by the laws of 1826 and 1890, which attempted to provide efficacious protection for endowed and charitable institutions, and to put an end to the abuses for which it was intended. The law considers as "charitable institutions" (opere pec) all poorhouses, almshouses and institutions which partly or wholly give help to able-bodied or infirm paupers, or seek to improve their moral and economic condition; and also the co-operative or charitable institutions which were founded by the various municipalities and communes, or by the various towns, or by the various provinces, or by the various Catholic, and composed of members elected by the municipal council), which administer funds destined for the poor in general. All charitable institutions were under the protection of provincial administrative boards, existing in every province, and empowered to control the management of charitable endowments. The supreme control was vested in the minister of the Interior. The law of 1890 also empowers every citizen to appeal to the tribunals on behalf of the poor, for the protection of their rights and interests as endowed or charitable institutions. A more recent law provides for the formation of a central body, with provincial commissions under it. Its effect, however, has been comparatively small.

Public pawnshops or Monti di pietà numbered 555 in 1896, with a net patrimonial fortune of £2,879,625. In that year their income, including revenue from capital, was £1,465,385, and their expenditure £300,232. The amount lent on security was £4,153,229.

The Monti frumentari or co-operative corn deposits, which lend seed, flour, meal, and other provisions on credit at nominal interest rates for the support of the sick in hospitals, and for the aid of the aged and needy, and of the poor. In Italy, the number of Monti frumentari has been constantly increasing. A more recent law provides for the formation of a central body, with provincial commissions under it. Its effect, however, has been comparatively small.

Charities.—In Italy there is no legal right in the poor to be supported by the parish or commune, nor any obligation on the commune to relieve the poor—except in the case of forsaken children and the sick poor. Public charity is exercised through the institutions of self-help, which are found in abundance everywhere, however, very unequally distributed in the different provinces.

The districts of Italy which show between 1881 and 1903 the greatest increase of new institutions, or of gifts to old ones, are Lombardy, Piedmont, Liguria, while Sardinia, Calabria and Basilicata stand lowest, Latium standing comparatively low.

The patronym of Italian charitable institutions is considerable and is constantly increasing. In 1880 the number of charitable institutions (exclusive of public pawnshops, or Monti di Pietà, and other institutions which combine operations of credit with charity) was approximately 22,000, with an aggregate patrimony of nearly £8,000,000. The revenue was about £3,600,000; after deduction of taxation there remained for distribution about £2,700,000. Adding to this £1,240,000 of communal and provincial subsidies, the product of the labour of inmates, temporary subscriptions, &c., the net revenue available for charity was, during 1880, £3,860,000.
There still exists the court of the spiritual potentate which in 1879 consisted of 1821 persons. Protestants number some 65,000, of whom half are Italian and half foreign. Of the former 22,500 are Waldensians. The number of Jews was returned as 36,000, but is certainly higher. There are, besides, in Italy some 2500 members of the Greek Orthodox Church. There were in 1901 20,707 parishes in Italy, 68,444 secular clergy and 48,043 regulars (monks, lay brothers and nuns). The size of parishes varies from province to province, Sicily having larger parishes in virtue of the old Sicilian church laws, and Naples, and some parts of central Italy, having the smallest. The Italian parishes had in 1901 a total gross revenue, including assignments from the public worship endowment fund, of £1,280,000 or an average of £63 per parish; 51% of this gross sum consists of revenue from glebe lands.

The kingdom is divided into archbishoprics and dioceses, or prelatures. The dioceses are as follows:

A. 6 sub-archiepiscopal sees—Ostia and Velletri, Porto and Sta Rufina, Albano, Frascati, Palestrina, Sabina—all held by cardinal bishops.

B. 74 sees immediately subject to the Holy See, of which 12 are archiepiscopal and 61 episcopal.

C. 37 ecclesiastical provinces, each under a metropolitan, composed of 148 suffragan dioceses. Their position is indicated in the following table:

**Metropolitans.**

which were to be accepted at their nominal value as purchase money for the alienated property. The public worship endowment fund has relieved the state exchequer of the cost of public worship; has gradually furnished to the poorer parish priests an addition to their income of £1 each per annum, with the promise of further raising them to £60; and has contributed to the outlay incurred by the communies for religious purposes. The monastic buildings required for public purposes have been made over to the community, and the monks and nuns have been entrusted with the administration of the ecclesiastical revenues previously set apart for charity and education, and objects of art and historical interest have been consigned to public libraries and museums. By these laws the reception of novices was forbidden, the existing conventual establishments the extinction of which had been decreed, and all new foundations were forbidden, except those engaged in instruction and the care of the sick. But the laws have not been rigorously enforced of late years; and the octroi and properties secured by the state were thrown on the market simultaneously, and so realized very low prices, being often bought up by wealthy religious institutions. The large number of these institutions was increased when these bodies were expelled from France.

On the 30th of June 1903 the patrimony of the endowment fund amounted to £7,339,040, of which only £2,685,289 were represented by buildings still occupied by monks or nuns. The rest was made up of capital and interest. The liabilities of the fund (capitalized) amounted to £6,668,105, of which monastic pensions represented a rapidly diminishing sum of £5,564,930. The chief items of annual expenditure drawn from the fund are the supplementary stipends to priests and the pensions to members of suppressed religious houses. The total annual receipts were £13,255; but while this item of expenditure will disappear by the deaths of those entitled to pensions, the supplementary stipends and contributions are gradually increasing. The following is the value of the two main categories of the fund from 1876 to 1902—

Roman Charitable and Religious Fund.—The law of the 10th of June 1873 contained special provisions, in conformity with the character of Rome as the seat of the papacy, and with the situation created by the Law of Guarantees. According to the census of 1871 there were in the city and province of Rome 74,743 monasteries and convents (311 for monks, 163 for nuns), occupied by 43,266 monks and 3,825 nuns, and possessing a gross revenue of 4,780,981 lire. Of these, 12,176 convents and 90 convents were situated in the city, 51 monasteries and 22 convents in the suburbicaries. The law of 1873 provided an annual charitable and educational fund of £17,996,120, the annual receipts and expenditure at first amounting to £1,796,120 and a debt of £4,900,819. Expenditure for the year 1902-1903 was £8,896,858 and revenue £8,186,574.
ITALY

[Titles of Honour. —The former existence of so many separate sovereignties and "fountains of honour" gave rise to a great many hereditary titles of nobility. Besides many hundreds of princes, dukedoms, marquesses, earls, barons and viscounts, there are a large number of persons of "pretori" and "pretrii" with a right to the designation nobilis or signori, and certain hereditary knights or cavaliers. In the "Golden Book of the Army" (Libro d'Oro del Consiglio) 321 pretorians are descended from patrician families, and of these 28 have the same name and the same rank as that of duke, seven are marquesses, counts or simply patricians. For the Italian orders of knighthood see KNIGHTED and CHIVALRY: Orders of Knighthood.

Justice.—The judiciary system of Italy is mainly framed on the French model. It has courts of cassation at Rome, Naples, Palermo, Turin, Florence, 20 appeal court districts, 162 tribunal districts, 711 judicial districts, 3,584 courts of first instance, and 2,545 in penal establishments, 10,000 minor in commissariats, and 4,547 in private reformatories, and 3,071 (males) were inmates of forced residences.

The medium of offences, including contraventioni or breaches of by-laws and regulations, exhibits a considerable number of 90,000 libertines from 1887, and only a slight diminution on the figures of 1897. The figure was 178,456 per 100,000 in 1887, 216,464 in 1892, 234,188 in 1897, 267,960 in 1902. The increase is partly covered by confessions, which are classed under the heads of confession, and of which 24,905 in 1892. The number of which the increase is really due is, however, the number of prisoners who have been dragged out to an unaccountable length. In this, as in the intervention of the presiding judge, the French system has been adopted; a proceeding, e.g. by Nathan, Vent' anni di vita italiana, p. 241, that the efforts of the government, though not in law, largely directed to prove that the accused is guilty. In 1901 884,612 persons accused of penal offences, 13,12% were acquitted during the period of the instruction, 30-31 by the courts, 49 condemned and the rest acquitted, though it shows that charges, often involving preliminary imprisonment, are brought against a large proportion of persons who are not or cannot be proved to be guilty. The courts of appeal and cassation have been directed by the law of 1905, the court of cassation at Rome decided 94 appeals on points of law in civil cases, while no fewer than 460 remained to be decided. As in most civilized countries, the number of suicides in Italy has increased from year to year.

The Italian suicide rate of 63-6 per 1,000,000 is, however, lower than those of Denmark, Switzerland, Germany and France, while it approximates to that of England. The Italian rate is highest in the secret, smug and industrial north, and lowest in the south. Emilia gives a maximum rate of 19-48, while the rate of Liguria and Lazio is lower. The minimum of 1-27 is found in the Basilicata, though Calabria gives only 2-13. About 25-47% of the total in Italy is suicide, and there is an increase of nearly 3% since 1882 in the proportion suicides under twenty years of age.

Army.—The Italian army grew out of the old Piedmontese army, with which the main unification of Italy was brought about. This unification meant for the army the absorption of contingents from all parts of Italy and presenting serious differences in physical and moral aptitudes, political opinions and education. Moreover the strategic geography of the country required the greater part of the army to be stationed permanently within reach of the north-eastern and north-western frontiers. These conditions made a territorial system of recruiting or organization, as understood in Germany, practically impossible. To secure fairly uniform efficiency in the various corps, and also as a means of unifying Italy, Piedmontese, Umbrians and Neapolitans is mixed in the same corps and sleep in the same barrack room. But on leaving the colours the men dispense to their homes, and thus a regiment has, on mobilization, to draw largely on the nearest reservists, irrespective of the corps to which they belong. The remedy for this condition of affairs is sought in a more elaborate and artificial system of transferring officers and men from one unit to another at stated intervals in peace-time, but this is no more than a palliative, and there are other methods almost equal importance to be surmounted.

Thus in Italy the Army is divided into the two categories, as a rule, into two organizations, one for the army and the national interests, with a maximum of friction. "Army Reform," therefore, has been very much in the forefront of late years owing to the estrangement of Austria (which power can mobilize much more rapidly), but financial difficulties have hitherto stood in the way.
of any radical and far-reaching reforms, and even the proposals of the Commission of 1877, referred to below, have only been partially accepted.

The law of 1875 therefore still regulates the principles of military service in Italy, though an important modification was made in 1907-1908. By this law, every man liable and accepted for service for eight or nine years on the Active Army and its Reserve (of which three to five were spent with the colours), four or five in the Militia, and the rest of the service period of nineteen years in the Territorial Militia. Under present regulations the term of liability is divided into nine years in the Active Army and Reserve (three or two years with the colours) four in the Mobile Militia and six in the Territorial Militia. But these figures do not represent the actual service of every able-bodied Italian. Like almost all "Universal Service" countries, Italy only drafts a small proportion of the available recruits into the army.

The following table shows the operation of the law of 1875, with the figures of 1871 for comparison:

1 Including officers on special service or in the reserve.

Thus, on the 30th of September 1871, the various categories of the army included only 2.3% of the population, but on the 30th of June 1901 they included 10.5%. But in 1901 the strength of the active army and reserve shows a marked diminution, which became accentuated in the following year. The table below indicates that up to 1907 the army, though always below its nominal strength, never absorbed more than a quarter of the available contingent.

The serious condition of recruiting was quickly noticed, and the tabulation of each year's results was followed by a new draft law, but no solution was achieved until a special commission assembled. The inquiries made by this body revealed an unsatisfactory condition in the national defences, traceable in the main to financial exigencies, and as regards recruiting a new law was brought into force in 1907-1908.

One specially difficult point concerned the effectiveness of the peace-strength army. Hitherto the actual time of training had been less than the nominal. The recruits due to join in November were not incorporated till the following March, and thus in the winter months Italy was defenceless. In 1907-1908 the army is always maintained at a low peace effective (about one-quarter of war establishment) and even this was reduced, by the absence of the recruits, until there were often only 15 rank and file with a company, whose war strength is about 250. Even in the summer and autumn a large proportion of the army consisted of men with but a few months' service—a highly dangerous state of things considering the peculiar mobilization conditions of the country. Further—and this case no legislation can obviate or correct, and (what is more serious) the latter service is being steadily weakened by emigration. The increase in the numbers required as unfit is accounted for by the fact that if only a small proportion of the contingent can be taken for service, the general standard of acceptance is high.

The net result of the scheme of 1907 re-established three categories of recruits, the 2nd category corresponding practically to the German Erbsatz-Reserve. The men classed in it have to train for six months, and they are called up in the late summer to bridge the gap above mentioned. The new terms of service for the other categories have already been stated. In consequence, in 1908, of 490,000 liable, some 110,000 actually joined for full training and 24,000 of the new 2nd category for short training, which contrasts very unfavourably with the feeble recruits of 1900 and 1907. These changes threw a considerable strain on the finances, but the imminence of the danger caused their acceptance.

The peace strength under the new scheme is nominally 300,000, but actually (average throughout the year) about 240,000. The army is organized in 12 army corps (each of 2 divisions), 6 of which are quartered on the plain of Lombardy and Venetia and on the frontiers, and 2 more in northern Central Italy. Their headquarters are: I. Turin, II. Alessandria, III. Milan, IV. Genoa, V. Verona, VI. Bologna, VII. Ancona, VIII. Florence, IX. Rome, X. Naples, XI. Bari, XII. Palermo, Sardinian division Cagliari. In addition there are 22 "Alpini" battalions and 15 mountain batteries stationed on the Alpine frontiers.

The war strength was established in 1902 as, Active Army (incl. Res.) 750,000, and 90,000 for the next seven years. The amount spent Militia 2,500,000 (more than half of the last-named untrained). These figures are, with a fractional increase in the Regular Army, applicable to-day. When the 1907 scheme takes full effect, however, the Active Army and the Mobile Militia will each be augmented by about one-third. In 1915 the field army should, including officers and permanent cadres, be about 1,021,000 strong. The Mobile Militia will not, however, at that date have felt the effects of the scheme, and the Territorial Militia (setting the drain of emigration against the increased population) will probably remain at about the same figure as in 1901.

The army consists of 96 three-battalion regiments of infantry of the line and 12 of bersaglieri (riflemen), each of the latter having a maximum of 898-1 (Bergen, German). The full establishment is being increased (provisionally formed): 26 regiments of cavalry, of which 10 are: arancs, each of 9 squadrons; 22 regiments of artillery, each of 8 batteries; 1 regiment of horse artillery, 6 of batteries; 1 regiment of signal corps, each of 3 artillery batteries, and 3 regiment artillery batteries. The armament of the infantry is the Männlicher-Carcano magazine rifle of 1891. The field and horse artillery was in 1909 in process of rearmament with a Krupp quick-firer. The garrison artillery consists of 3 coast and 3 fortress regiments, with a total of 7,000 men (11 battalions) of engineers. The carabinieri or gendarmerie, some 26,500 in number, are part of the standing army; they are recruited from selected volunteers from the army. In 1902 the special corps in Eritrea numbered about 2000 all ranks, including nearly 4000 officers and men.

Ordinary and extraordinary military expenditure for the financial year 1898-1899 amounted to nearly 10,000,000, an increase of 4,000,000 as compared with 1871. The Italian Chamber decided that in 1871 the amount was 45,000,000 of lire. Military expenditure proper should not exceed the maximum of 9,600,000 per annum fixed by the Army Bill of May 1897, and that military pensions should not exceed 1,440,000. Italian military expenditure was thus until 1907 (11,000,000 per annum). In 1908 the ordinary and extraordinary expenditure was £10,000,000.

The demands of the Commission were only partly complied with, but a large special grant was voted amounting to at least £1,000,000 per annum. The armament of the army includes 1200 field guns, 2000 coast and fortress guns, and 2800 mortars, howitzers, and field-pieces, and 3,000 machine guns. The navy includes 800 large and small vessels; 26000 men, sailors, and seamen. The armament of the navy is the Sardinia, a battleship of 1899. The coast artillery consists of 1800 pieces, and the forts a total of 1500 guns of various calibre. The coast artillery includes 3000 officers and men. The number of men in the navy is 30,000, of whom 9000 are in the reserve. The number of vessels is 4000, of which 100 are of war; 1700 are coasting vessels; 600 are coasting vessels.

The Alpine frontier is fortified strongly, although the condition of the works was in many cases unsatisfactory. The Italian military expenditure has been 12000 per annum for the year 1915. The chief coast fortresses are Vado, Genoa, Spezia, Monte Argentario, Gaeta, Straits of Messina, Taranto, Maddalena. Rome is protected by an entrenched position from a cou.de main from the sea, the coast, only 12 m. off, being flat and deserted.

Navy.—For purposes of naval organization the Italian coast is divided into three maritime departments, with headquarters at Spezia, Naples and Venice; and into two comandi militari, with headquarters at Taranto and at the island of Maddalena. The personnel of the navy consists of the following corps: (1) General staff; (2) naval engineers, chiefly employed in building and repairing war vessels; (3) sanitary corps; (4) commissariat corps, for supplies and account-keeping; (5) crews.

The matériel of the Italian navy has been completely transformed, especially in virtue of the bill of the 31st of March 1875. The ships of the old type have been sold or demolished, and replaced by newer types.

1 This may be reduced, in consequence of the adoption of the new Q.F. gun, 1 to 6.
In March 1907 the Italian navy contained, excluding ships of no fight ing value:—

The four modern ships—the "Vittorio Emanuele" class, laid down in 1897—have a tonnage of 13,625, two 12-in. and twelve 8-in. guns, an I.H.P. of 19,000, and a designed speed of 22 knots, being intended not to avoid any battleship and to carry enough guns to destroy any cruiser.

The personnel on active service consisted of 1799 officers and 25,000 men, the former being doubled and the latter trebled since 1882.

Naval expenditure has enormously increased since 1871, the total for 1871 having been about £90,000, and the total for 1905–1906 over £5,100,000. Violent fluctuations have, however, taken place from year to year, according to the state of Italian finances. To permit the steady execution of a normal programme of shipbuilding, the Italian Chamber, in May 1901, adopted a resolution limiting naval expenditure, inclusive of naval pensions and of premiums on merchant ships, to the sum of £4,850,000 for the following six years, i.e. from 1st July 1901 until 30th June 1907. This sum consists of £4,240,000 of naval expenditure proper, £220,000 for naval pensions and £80,000 for premiums upon mercantile shipbuilding.

The figures for the year ending on the 30th of June 1906 were as follows, and the expenditure was increased to £5,100,000.

The increase in expenditure is explained by the increase in military expenditure.

**Finance.**—The volume of the Italian budget has increased as regards both income and expenditure. The income of £50,741,418 in 1881 rose in 1899–1900 to £69,971,712; while the expenditure increased from £58,705,929 in 1881 to £69,708,706 in 1899–1900, an increase of £11,002,777 in income and £13,001,777 in expenditure, while the decrease in the two budgets was still greater. In 1899–1900 the income of £1,002,777 and expenditure of £13,001,777. In 1899–1900, the income was £99,945,253, and expenditure was £98,343,560. The increase in expenditure was due to the increased expenditure of the government for the war with Austria. The increased expenditure of the government is mainly due to the increased expenditure of the military, and the increased expenditure of the commercial and financial crises.

The financial year 1899–1900 was characterised by the following events:—

1. The financial crisis of 1899–1900, which affected the entire world, caused a decrease in the income of the government, especially in the income from taxes,

2. The financial crisis of 1899–1900, which affected the entire world, caused a decrease in the income of the government, especially in the income from taxes,

3. The financial crisis of 1899–1900, which affected the entire world, caused a decrease in the income of the government, especially in the income from taxes,

4. The financial crisis of 1899–1900, which affected the entire world, caused a decrease in the income of the government, especially in the income from taxes.
applied to goods which cannot be made in Italy; hardly anything comes in duty free, even such articles as second-hand furniture paying duty, unless within six months of the date at which the importer has declared domicile in Italy. The application, too, is of little avail to avoid the tax on electrical energy, the sale of which is not only claimed because of the low price of coal, but is also a source of revenue from the consumption of the object itself. The annual consumption per inhabitant of certain kinds of food and drink has considerably increased, e.g., grain from 270 lb per head in 1871 to 330 lb in 1892 and the per capita income from 18.8 to 26.8 lb; wine from 73 to 125 litres per head; oil from 12 to 15 lb per head (sugar is almost stationary at 7.1 lb per head, and coffee at about 1 lb); salt from 14 to 16 lb per head. Tobacco slightly diminished in weight at a rate of 1 lb per head, while the receipts have increased—by over 24 million sterling since 1884—showing that the quality consumed is much better.

The annual expenditure on tobacco was 5s. per inhabitant in 1902—

1903, and is increasing.

The net surplus is largely accounted for by the heavy taxation on almost everything imported into the country, and by the monopolies on tobacco and on salt; and are as a rule spent, well and spent, in other ways. Thus, that of 1907—1908 was largely spent mainly to raising the salaries of government officials and university professors; even then the maximum for both (in the former class, for an under-secretary of state) was only 500 per annum. The case is frequent, too, in which a project is sanctioned by law, but is then not carried into execution, or is only partly carried out, because of the lack of funds. Additional stamp duties and taxes were imposed in 1909 to meet the expenditure necessitated by the disastrous earthquake at the end of 1908.

The way in which the taxes press on the poor may be shown by the number of small proprietors sold up owing to inability to pay the land and other taxes. In 1882 the number of landed proprietors was 14.5% of the population, in 1902 only 12.6%, with an actual diminution of about 10,000. Had the percentage of 1882 been kept up there would have been in 1902 600,000 more proprietors than there were. Between 1884 and 1902 no fewer than 226,616 sales were effected for failure to pay taxes, while, from 1884 to 1902, 79,682 operations were initiated for similar reasons, the former being due mainly to incurring the salaries of government officials and university professors; even then the maximum for both (in the former class, for an under-secretary of state) was only 500 per annum. low, but rose again in 1898 and 1899. In 1900 the maximum rate was 107½, and the minimum 105½, but in 1901 rates fell considerably, and were at par in 1902–1903.

There are in Italy six clearing houses, namely, the ancient one at Leghorn and those of Genoa, Milan, Rome, Florence and Turin, founded since 1882.

The number of ordinary banks, which diminished between 1889 and 1894, increased in the following years, and was 158 in 1898. At the same time the capital employed in banking decreased by nearly one-third, and fell to £27,360,000 in 1898. This decrease was due to the liquidation of a number of large and small banks, amongst others the Bank of Genoa, the General Bank, and the Società di Credito Mobiliare Italiano of Rome, and the Genova Discount Bank—establishments which alone represented £1,840,000 of paid-up capital. Ordinary credit operations are also carried on by the co-operative credit societies, of which there are some 700.

Credit banking is a special business of lending money to owners of land or buildings (credito fondiario). Loans are repayable by instalments, and are guaranteed by first mortgages not greater in amount than half the value of the hypothecated property. The banks may buy up mortgages and advance money on current account on the security of land or buildings. The development of the large cities has induced these banks to turn their attention rather to building enterprise than to mortgages on rural property. The value of their land certificates or building-bonds (credito foncario, or boni di circolazione) rose from £10,420,000 in 1881 to £15,750,000 in 1886, and to £30,720,000 in 1891, but fell to £29,320,000 in 1896, to £27,360,000 in 1898, and to £24,360,000 in 1907; the amount of money lent increased from £28,430,000 in 1881 to £39,000,000 in 1891, but fell to £29,320,000 in 1896, to £27,360,000 in 1898, and to £21,720,000 in 1907. The diminution was due to the law of the 18th of April 1893 upon the banks of issue, by which they were obliged to liquidate the loan and mortgage business they had previously transacted.

Various laws have been passed to facilitate agrarian credit. The law of the 23rd of January 1887 (still in force) extended the dispositions of the Civil Code with regard to 'privileges,' and established agrarian credits. Farmers are allowed to produce stored in barns and farm buildings, and in agriculture, implements. Loans on mortgage may also be granted to landowners and agricultural unions, with a view to the introduction of agricultural improvements. These loans are regulated by special disposition, and are guaranteed by a share of the increased value of the land after the improvements have been carried out. Agrarian credit banks may, with the permission of the government, issue certificati di deposito or agrarian bonds, repayable by instalments and bearing interest.

Internal Administration.—It was not till 1865 that the administrative unity of Italy was realized. Up to that year some of the regions of the kingdom, such as Tuscany, continued to have a kind of local administration, and the whole country was divided into 69 provinces and 845 communes. The extent to which communal independence had been maintained in Italy through all the centuries of its political disintegration was strongly shown in the town elections. The commune of Pisa was appointed by the king for three years, and he was assisted by a "municipal junta." Local government was modified by the law of the 10th of February 1889 and by posterior enactments. The syndics (or mayors) are now elected by a secret ballot of the communal council, though they are still government officials. In the provincial administrations the functions of the prefects have been curtailed. Each province has a prefect, responsible to and appointed by the Ministry of the Interior, and in it are organized the judicial, educational, and sanitary services. The president of the provincial deputation is ex-officio president of the provincial deputation or executive committee of the provincial council, his duties under the present law are reduced to mere executive functions. The provincial council is composed of the communal electors, and the president of the provincial deputation being chosen among and elected by the members of the deputation. The most important change introduced by the new law has been the creation in every province of a provincial administrative junta entitled with the supervision of communal administrations, a function previously discharged by the provincial deputation. Each provincial administrative junta is composed, in part, of government nominees, and in larger part of elective elements, elected by the provincial council for four years. It possesses the right of examination and control of acts of communal administration requiring the sanction of the provincial administrative junta, and the government being guided by the opinion of the Council of State. Besides possessing competence in regard to local government elections, which

---

1° Privileges assure to creditors priority of claim in case of foreclosure for debt or mortgage. Prior to the law of the 23rd of January 1887 harvest produce and agricultural implements were legally exempt from privilege.

2 The number of local elections has been modified, and it is now sufficient to pay five lire annually in direct taxes, five lire of certain communal taxes, or a certain rental (which varies according to the population of a commune), instead of being obliged to pay five lire annually of direct taxes to the state. In consequence of this change the number of local electors increased by more than one-third between 1887–1889; it decreased, however, as a result of an extraordinary tax (still to be registered in 1894. The period for which both communal and provincial electors are elected is six years, one-half being renewed every three years.

3 The ratio of local electors to population is in Piedmont 79½ per cent, but in Sicily less than 45 per cent. The ratio of voters to qualified electors tends to increase; it is highest in Campania, Basilicata, and in the south generally; the lowest percentages are given by Emilia and Liguria.

Local finance is regulated by the communal and provincial law of March 31, 1898. Each communal province, in addition to its local junta, is empowered to examine and sanction the acts of the communal financial administrations. The sanction of the provincial administrative junta is necessary for sales or purchases of property or land, for grants of mortgages, for loans, or settlements of grants, for paying an aggregate of one-twentieth of the local direct taxation), and expenditure affecting the communal budget for more than five years. The provincial administrative junta is, moreover, empowered to ordain local taxes and the rate of local expenditure, such as the upkeep and sanitary works, lighting, police (i.e. the so-called "guardie di pubblica sicurezza," the "carabinieri" being really a military force; only the largest towns maintain a municipal police force), charities, education, &c.; there is also a national property tax.

The cost of fire brigades, infant asylums, evening and holiday schools, is classed as "optional" expenditure. Communal revenues are drawn from the proceeds of communal property, interest upon capital, taxes and local dues. The most important of the local dues is the gate tax, or dazio di consumo, which may be either a surtax upon commodities (such as alcoholic drinks or meat), having already paid customs duty at the frontier, in which case the local surtax may not exceed 50% of the frontier duty, or an exclusively communal duty, such as 10% on flour, bread and farinaceous products, to and 20% upon other commodities. The taxes thus vary considerably in different towns.

In addition, the communal taxes have a right to levy a surtax not exceeding 10% on the vineyards. It is levied by the state on lands and buildings; a family tax, or fiscatico, upon the total incomes of families, which, for fiscal purposes, are divided into various categories; a tax based upon the rent-value of houses, and other taxes upon the quality of the food consumed, duties upon wines, spirits, tobacco, shopkeepers, hotel and restaurant keepers, &c.; on the slaughter of animals, stamp duties, one-half of the tax on bicycles, &c. Occasional sources of interest are found in the sale of communal property, the realization of communal credits, and the contraction of debt.

The provincial administrations are entrusted with the management of the affairs of the provinces in general, as distinguished from those of the communes. Their expenditure is likewise classed as "obligatory" and "optional." The former category comprises the maintenance (casse) of schools, libraries, museums, hospitals, and other public establishments; secondary education, whenever this is not provided for by private institutions or by the state (elementary education being maintained by the communes), and the maintenance of foundlings and children of the poor. The expenditure and the revenues do not form a regular series of services of general public interest, though not strictly indispensable. Provincial revenues are drawn from provincial property, school taxes, tolls and surtaxes on land and buildings. The provincial surtaxes are estimated at £4,000,000 to £5,000,000 by the state. In 1897 the total provincial revenue was £3,732,553, of which £3,400,000 was obtained from the surtax upon lands and buildings. Expenditure amounted to £3,768,888, of which the principal items were £760,000 for roads and bridges, £520,000 for lunatic asylums, £240,000 for public libraries, £200,000 for provincial schools, £100,000 for police. Like communal revenue, provincial revenue has considerably increased since 1880, principally on account of the increase in the land and building surtaxes.

At the beginning of 1902 the Italian parliament sanctioned a bill providing for the abolition of municipal duties on bread and farinaceous products within three years of the promulgation of the bill on 1st July 1902.
from 30-79 lire (f. 145, r.d.), to 43-70 lire (f. 148, r.d.), an increase due in great part to the need for improved buildings, hydraulic reforms and education, but also attributable in part to the manner in which the finances of many communes are administered. The total was in 1900, £49,496,193 for the communes, and £6,908,022 for the provinces. The former total is more than double and the latter more than triple the sum in 1873, while there is an increase of 62 % in the former and 26 % in the latter over the totals for 1885.

HISTORY

The difficulty of Italian history lies in the fact that until modern times the Italians have had no political unity, no independence, no organized existence as a nation. Split up into numerous and mutually hostile communities, they never, through the fourteen centuries which have elapsed since the end of the old Western empire, shook off the yoke of foreigners completely; they never until lately learned to merge their local and conflicting interests in the common good of undivided Italy. Their history is therefore not the history of a single people, centralizing and absorbing its constituent elements by a process of continued evolution, but of a group of cognate populations, exemplifying divers types of constitutional developments.

The early history of Italy will be found under Rome and allied headings. The following account is therefore mainly concerned with the periods succeeding A.D. 476, when Romulus Augustus was deposed by Odoacer. Prefixed to this are two sections dealing respectively with (A) the ethnographical and philological divisions of ancient Italy, and (B) the unification of the country under Augustus, the growth of the road system and so forth. The subsequent history is divided into five periods: (C) From 476 to 1796; (D) From 1796 to 1814; (E) From 1815 to 1870; (F) From 1870 to 1902; (G) From 1902 to 1910.

A. ANCIENT LANGUAGES AND PEOPLES

The ethnography of ancient Italy is a very complicated and difficult subject, and notwithstanding the researches of modern scholars is still involved in some obscurity. The great beauty and fertility of the country, as well as the charm of its climate, undoubtedly attracted, even in early ages, successive swarms of invaders from the north, who sometimes drove out the occupants of the most favoured districts, at others reduced them to a state of servitude, or settled down in the midst of them, until the two races gradually coalesced. Ancient writers are agreed as to the composite character of the population of Italy, and the diversity of races that were found within the limits of the peninsula. But unfortunately the traditions they have transmitted to us are often various and conflicting, while the only safe test of the affinities of nations, derived from the comparison of their languages, is to a great extent inapplicable, from the fact that the idioms that prevailed in Italy in and before the 5th century B.C. are preserved, if at all, only in a few scanty and fragmentary inscriptions, though from that date onwards we have now a very fair record of many of them (see, e.g. LATIN LANGUAGE, OSCI LINGUA, IUVIGNU, VOLSCI, ETRURIA: section Language, and below). These materials, imperfect as they are, when combined with the notices derived from ancient writers and the evidence of archaeological excavations, may be considered as having furnished some results of reasonable certainty.

It must be observed that the name "Italians" was at one time confined to the Oenotrians; indeed, according to Antiochus of Syracuse (epid. Dion. Hal. Ant. Rom. ii. 1), the name of Italy was first still more limited, being applied only to the southern portion of the Bruttium peninsula (now known as Calabria). But in the time of that historian, as well as of Thucydides, the names of Oenotria and Italia, which appear to have been at that period regarded as synonymous, had been extended to include the shore of Tarentine Gulf as far as Metapontum and from thence across to the gulfs of Laus and Posidonia on the Tyrrhenian Sea. It thus still comprised only the two provinces subsequently known as Lucania and Bruttium (see references s. n. "Italia" in R. S. Conway's Italic Dialects, p. 5). The name seems to be a Graecized form of an Italic *Vitelia*, from the stem *vitel-* "call" (Lat. *vitalis*, Gr. *tēlin*), and perhaps to have meant "self-, "gazing land"; but the origin is more certain than the meaning; the call may be one of the many animals connected with Italian tribes (see HIRPINI, SAMNITES).

Taking the term Italy to comprise the whole peninsula with the northern region as far as the Alps, we must first distinguish the tribe or tribes which spoke Indo-European languages from those who did not. To the latter category it is now possible to refer with certainty only the Etruscans (for the chronology and limits of their occupation of Italian soil see ETRURIA: section Language). Of all the other tribes that inhabited Italy down to the classical period, of whose speech there is any record (whether explicit or in the form of names and glosses), it is impossible to maintain that any one does not belong to the Indo-European group. Putting aside the Etruscan, and also the different Greek dialects of the Greek colonies, like Cumae, Neapolis, Tarentum, and proceeding from the south to the north, the different languages or dialects, of whose separate existence at some time between, say, 600 and 200 B.C., we can be sure, may be enumerated as follows: (1) Sikel, (2) South Oscar and Oscar, (3) Messapian, (4) North Oscar, (5) Volscian, (6) East Italian or "Sabellic," (7) Latinian, (8) Sabine, (9) Iguvine or "Umbrian," (10) Gallic, (11) Ligurian and (12) Venetic.

Between several of these dialects it is probable that closer affinities exist. (1) It is probable, though not very clearly demonstrated, that Venetic, East Italian and Messapian are connected together and with the ancient dialects spoken in Illyria (q.v.), so that these might be provisionally entitled the Adriatic group, to which the language spoken by the Eteocretes of the city of Prazion in Crete down to the 4th century B.C. was perhaps akin. (2) Too little is known of the Sabellic language to make clear more than its Indo-European character. But it must be reckoned among the languages of Italy because of the well-supported tradition of the early existence of the Sicels in Latium (see SICULI). Their possible place in the earlier stratum of Indo-European population is discussed under SABINI. How far also the language or languages spoken in Bruttium and at certain points of Lucania, such as Anxia, differed from the Oscar of Samnium and Campania there is not enough evidence to show (see BRUTTII). (3) It is doubtful whether there are any actual inscriptions which can be referred with certainty to the language of the Ligures, but some other evidence seems to link them with the -CO-peoples, whose early distribution is discussed under VOLSCI and LIGURIA. (4) It is difficult to point to any definite evidence by which we may determine the dates of the earliest appearance of Gallic tribes in the north of Italy. No satisfactory collection has been made of the Celtic inscriptions of Cisalpine Gaul, though many are scattered about in different museums. For our present purpose it is important to note that the archaeological stratification in deposits like those of Bologna shows that the Gallic period supervened upon the Etruscan. Until a scientific collection of the local and personal names of this district has been made, and until the archaeological evidence is clearly interpreted, it is impossible to go beyond the region of conjecture as to the tribe or tribes occupying the valley of the Po before the two invasions. It is clear, however, that the Celtic and Etruscan elements together occupied the greater part of the district between the Apennines and the Alps down to its Romanization, which took place gradually in the course of the 2nd century B.C. Their linguistic neighbours were Ligurian in the south and south-west, and the Veneti on the east.

We know from the Roman historians that a large force of Gauls came as far south as Rome in the year 390 B.C., and that some part of this horde settled in what was henceforward known as the Ager Gallicus, the easternmost strip of coast in what was later known as Umbria, including the towns of Caesena, Ravenna and Ariminum. A bilingual inscription (Gallic and Latin) of
the 2nd century B.C. was found as far south as Tuder, the modern Todi (Italic Dialects, ii. 528; Stokes, Beesemberger's Beiträge, ii. 123).

(5) Turning now to the languages which constitute the Italic group in the narrower sense, (a) Oscan; (b) the dialect of Velitrea, commonly called Volscian; (c) Latinian (i.e. Latin and its nearest congers, like Faliscan); and (d) Umbrian (or, as it may more safely be called, Iguvine), two principles of classification offer themselves, of which the first is purely linguistic, the second linguistic and topographical. Writers on the etymology of Italy have been hitherto content with the first, namely, the broad distinction between the dialects which preserved the Indo-European velars (especially the breathed plosive q) as velars or back-palatals (gutturals), with or without the addition of a w-sound, and the dialects which converted the velars wholly into labials, for example, Latinian quis contrasted with Oscan, Volscian and Umbrian pis (see further LATIN LANGUAGE).

This distinction, however, takes us but a little way towards an historical grouping of the tribes, since the only Latinian dialects of which, besides Latin, we have inscriptions are Faliscan and Marsian (see FALISCI, MARSII); although the place-names of the Aequi (q.e.v.) suggest that they belong to the same group in this respect. Except, therefore, for a very small and apparently isolated area in the north of Latium and south of Etruria, all the tribes of Italy, though their idioms differed in certain particulars, are left undiscriminated. This presents a strong contrast to the evidence of tradition, which asserts very strongly (1) the identity of the Sabines and Samnites; (2) the conquest of an earlier population by this tribe; and which affords (3) clear evidence of the identity of the Sabines with the ruling class, i.e. the patricians, at Rome itself (see SABINI; and ROM. Early History and Ethnology).

Some clue to this enigma may perhaps be found in the second principle of classification proposed by the present writer at the Congresso Internazionale di Scienze Storiche at Rome (Atti del Congresso, ii) in 1903. It was on that occasion pointed out that the ethnical or tribal and oppidian names of communities belonging to the Sabine stock were marked by the use of the suffix -NO- as in Sabini; and that there was some linguistic evidence that this stratum of population overcame an earlier population, which used, generally, ethnica in -CO- or -TI- (as in Merrucii, Ardeates, transformed later into Murrucini, Ardeatini).

The validity of this distinction and its results are discussed under SABINI and VOLSCI, but it is well to state here its chief consequences.

1. Latin will be counted the language of the earlier plebeian stratum of the population of Rome and Latium, probably once spread over a large area of the peninsula, and akin in some degree to the language or languages spoken in north Italy before either the Etruscan or the Gallic invasions began.

2. It would follow, on the other hand, that what is called Oscan represented the language of the invading Sabines (more correctly Satines), whose racial affinities would seem to be of a distinctly more northern cast, and to mark them, like the Dorian or Achaean Greeks, as an early wave of the invaders who more than once in later history have vitally influenced the fortunes of the tempting southern land into which they forced their way.

3. What is called Volscian, known only from the important inscription of the town of Velitrea, and what is called Umbrian, known from the famous Iguvine Tables with a few other records, would be regarded as Saflne dialects, spoken by Saflne communities who had become more or less isolated in the midst of the earlier and possibly partly Etruscanized populations, the result being that as early as the 4th century B.C. their language had suffered corruptions which it escaped both in the Samnite mountains and in the independent and self-contained community of Rome.

For fuller details the reader must be referred to the separate articles already mentioned, and to IGUVIUM, PICENUM, OSCA LINGUA, MARSII, AQUII, SICULI and LIGURIA. Such archaeological evidence as can be connected with the linguistic data will there be discussed.

( R. S. C.)

B. CONSOLIDATION OF ITALY

We have seen that the name of Italy was originally applied only to the southernmost part of the peninsula, and was only gradually extended so as to comprise the central regions, such as Latium and Campania, which were designated by writers as late as Thucydides and Aristotle as in Opicia. The progress of this change cannot be followed in detail, but there can be little doubt that the extension of the Roman arms, and the gradual union of the nations of the peninsula under one dominant power, would contribute to the introduction, or rather would make the necessity felt, for the use of one general appellation. At first, indeed, the term was apparently confined to the regions of the central and southern districts, exclusive of Cisalpine Gaul and the whole tract north of the Appenines, and this continued to be the official or definite signification of the name down to the end of the republic. But the natural limits of Italy are so clearly marked that the name came to be generally employed as a geographical term at a much earlier period. Thus we already find Polybius repeatedly applying it in this wider signification to the whole country, as far as the foot of the Alps; and it is evident from many passages in the Latin writers that this was the familiar use of the term in the days of Cicero and Caesar. The official distinction was, however, still retained. Cisalpine Gaul, including the whole of northern Italy, still constituted a "province," an appellation never applied to Italy itself. As such it was assigned to Julius Caesar, together with Transalpine Gaul, and it was not till he crossed the Rubicon that he entered Italy in the strict sense of the term.

Augustus was the first who gave a definite administrative organization to Italy as a whole, and at the same time gave official sanction to that wider acceptance of the name which had already established itself in familiar usage, and which has continued to prevail ever since.

The division of Italy into eleven regions, instituted by Augustus for administrative purposes, which continued in official use till the reign of Constantine, was based mainly on the territorial divisions previously existing, and preserved with few exceptions the ancient limits.

The first region comprised Latium (in the more extended sense of the term, as including the land of the Volsci, Hernici and Aurunci), together with Campania and the district of the Picentini. It thus extended from the mouth of the Tiber to that of the Silarus (see LATIUM).

The second region included Apulia and Calabria (the name by which the Romans usually designated the district known to the Greeks as Messapia or Iapygia), together with the land of the Hirpini, which had usually been considered as a part of Samnium.

The third region contained Lucania and Bruttium; it was bounded on the west coast by the Silarus, on the east by the Bruttium.

The fourth region comprised all the Samnites (except the Hirpini), together with the Sabines and the cognate tribes of the Franti, Murrucini, Marisci, Peligni, Vestini and Aequiul.

It was separated from Apulia on the south by the river Tifernus, and from Picenum on the north by the Matrinus.

The fifth region was composed solely of Picenum, extending along the coast of the Adriatic from the mouth of the Matrinus to that of the Aesis, beyond Ancona.

The sixth region was formed by Umbria, in the more extended sense of the term, as including the Ager Gallicus, along the coast of the Adriatic from the Aesis to the Ariminus, and separated from Etruria on the west by the Tiber.

The seventh region consisted of Etruria, which preserved its ancient limits, extending from the Tiber to the Turrhenian Sea, and separated from Liguria on the north by the river Matrinus.

The eighth region, termed Gallia Cispadana, comprised the southern portion of Cisalpine Gaul, and was bounded on the north (as its name implied) by the river Padus or Po, from above Placentia to its mouth. It was separated from Etruria and Umbria by the main chain of the Apennines; and the river
Ariminus was substituted for the far-famed Rubicon as its limit on the Adriatic.

The ninth region comprised Liguria, extending along the seacoast from the Varus to the Macra, and inland as far as the river Padus, which constituted its northern boundary from its source in Mount Vesulus to its confluence with the Trebia just above Placentia.

The tenth region included Venetia from the Padus and Adriatic to the Alps, to which was annexed the neighbouring province of Istria, and to the west the territory of the Cenomani, a Gaulish tribe, extending from the Athes to the Addua, which had previously been regarded as a part of Gallia Cisalpina.

The eleventh region, known as Gallia Transpadana, included the whole of Cisalpine Gaul from the Padus on the south and the Addua on the east to the foot of the Alps.

The arrangements thus established by Augustus continued almost unchanged till the time of Constantine, and formed the basis of all subsequent administrative divisions until the fall of the Western empire.

Roads. As the supremacy of Rome extended itself over Italy, the Roman road system grew step by step, each fresh conquest being marked by the pushing forward of roads through the heart of the newly-conquered territory, and the establishment of fortresses in connexion with them. It was in Italy that the military value of a network of roads was first appreciated by the Romans, and the lesson stood them in good stead in the provinces. And it was for military reasons that from mere cart-tracks they were developed into permanent highways (T. Ashby, in Papers of the British School at Rome, i. 129). From Rome itself roads radiated in all directions. Communications with the south-east were mainly provided by the Via Appia (the "queen of Roman roads," as Statius called it) and the Via Latina, which met close to Caesilium, at the crossing of the Volturnus 3 m. N.W. of Capua, the second city in Italy in the 3rd century B.C., and the centre of the road system of Campania. Here the Via Appia turned eastward towards Beneventum, while the Via Popilia continued in a south-easterly direction through the Campanian plain and thence southwards through the mountains of Lucania and Bruttia as far as Rhegium.

Coast roads of minor importance as means of through communication also existed on both sides of the "toe" of the boot. Other roads ran south from Capua to Cumae, Puteoli (the most important harbour of Campania), and Neapolis, which could also be reached by a coast road from Minturnae on the Via Appia. From Beneventum, another important road centre, the Via Appia itself ran south-east through the mountains past Venusia to Tarentum on the south-west coast of the "heel," and thence across Calabria to Brundisium, while Trajan's correction of it, following an older mule-track, ran north-east through the mountains and then through the lower ground of Apulia, reaching the coast at Barium. Both met at Brundisium, the principal port for the East. From Aquem Tuticum, on the Via Traiana, the Via Hercula ran to the south-east, crossing the older Via Appia, then south to Potentia and so on to join the Via Popilia in the centre of Lucania.

The only highroad of importance which left Rome and ran eastwards, the Via Valeria, was not completed as far as the Adriatic before the time of Claudius; but on the north and north-west started the main highways which communicated with central and northern Italy, and with all that part of the Roman empire which was accessible by land. The Via Salaria, a very ancient road, with its branch, the Via Caecilia, ran north-eastwards to the Adriatic coast and so also did the Via Flaminia, which reached the coast at Fanum Fortunae, and thence followed it to Ariminum.

The road along the east coast from Fanum Fortunae down to Barium, which connected the terminations of the Via Salaria and Via Valeria, and of other roads farther south crossing from Campania, had no special name in ancient times, as far as we know. The Via Flaminia was the earliest and most important road to the north; and it was soon extended (in 187 B.C.) by the Via Aemilia running through Bononia as far as Placentia, in an almost absolutely straight line between the plain of the Po and the foot of the Apennines. In the same year a road was constructed over the Apennines from Bononia to Arretium, but it is difficult to suppose that it was not until later that the Via Cassia was made, giving a direct communication between Arretium and Rome. The Via Clodia was an alternative route to the Cassia for the first portion out of Rome, a branch having been built at the same time from Florentia to Lucca and Luna. Along the west coast the Via Aurelia ran up to Fisa and was continued by another Via Aemilia to Genoa. Thence the Via Postumia led to Dertona, Placentia and Cremona, while the Via Aemilia and the Via Julia Augusta continued along the coast into Gallia Narbonensis.

The road system of Cisalpine Gaul was mainly conditioned by the rivers which had to be crossed, and the Alpine passes which had to be approached.

Lombardy, on the north bank of the Po, was an important meeting point of roads and Hostilia (Ostiglia) another; so also was Patavium, farther east, and Altinum and Aquileia farther east still. Roads, indeed, were almost as plentiful as railways at the present day in the basin of the Po.

As to the roads leading out of Italy, from Aquileia roads diverged northward into Raetia, eastward to Noricum and Pannonia, and southwards to the Istrin and Dalmatian coasts. Farther west came the roads over the higher Alpine passes—the Brenner from Verona, the Septimer and the Splügen from Clavenna (Chiavenna), the Great and the Little St Bernard from Augusta Praetoria (Aosta), and the Mont Genèvre from Augusta Turinorum (Turin).

Westward two short but important roads led on each side of the Tiber to the great harbour at its mouth; while the coast of Latium was supplied with a coast road by Septimius Severus. To the south-west the roads were short and of little importance. On recent Italian geography, general see articles in Pauly-Wissowa, Realecyclopaedie (1899, sqq.); Corpus inscriptionum Latinarum (B. 1862 sqq.); G. Strackbello, Geografia dell' Italia (Turin, 1899-1902); H. Nissen, Italice Landeskunde (Berlin, 1883-1902); also references in articles Rome, Latium, &c. (T. As.)

C. From 476 to 1796

The year 476 opened a new age for the Italian people. Odoacer, a chief of the Herulians, deposed Romulus, the last Augustus of the West, and placed the peninsula beneath the titulary sway of the Byzantine emperors. At Pavia the barbarian conquerors of Italy proclaimed him king, and he received from Zeno the dignity of Roman pontiff. Thus began that system of mixed government, Teutonic and Roman, which, in the absence of a national monarch, impressed the institutions of new Italy from the earliest date with dualism. The same revolution vested supreme authority in a non-resident and inefficient autocrat, whose title gave him the right to interfere in Italian affairs, but who lacked the power and will to rule the people for his own or their advantage. Odoacer inaugurated that long series of foreign rulers—Gotths, Franks, Germans, Spaniards and Austrians—who have successively contributed to the misgovernment of Italy from distant seats of empire.

I. Gothic and Lombard Kingdoms.—In 488 Theodoric, king of the East Goths, received commission from the Greek emperor, Zeno, to undertake the affairs of Italy. He defeated Odoacer, drove him to Ravenna, besieged him there, and in 493 completed the conquest of the country by murdering the Herulian chief with his own hand. Theodoric respected the Roman institutions which he found in Italy, held the Eternal City sacred, and governed by ministers chosen from the Roman population. He settled at Ravenna, which had been the capital of Italy since the days of Honorius, and which still testifies by its monuments to the Gothic chieftain's Romanizing policy. Those who believe that the Italians would have gained strength by unification in a single monarchy must regret that this Gothic kingdom lacked the elements of stability. The Goths, except in the valley of the Po, resembled an army of occupation rather than a people numerous enough to blend with the Italic stock. Though their...
rule was favourable to the Romans, they were Arians; and religious differences, combined with the pride and jealousies of a nation accustomed to imperial honours, rendered the inhabitants of Italy eager to throw off their yoke. When, therefore, Justinian undertook the reconquest of Italy, his generals, Belisarius and Narses, were supported by the south. The struggle of the Greeks and the Goths was carried on for fourteen years, between 539 and 553, when Teias, the last Gothic king, was finally defeated in a bloody battle near Vesuvius. At its close the provinces of Italy were placed beneath Greek dukes, controlled by a governor-general, entitled exarch, who ruled in the Byzantine emperor's name at Ravenna.

This new settlement lasted but a few years. Narses had employed Lombard auxiliaries in his campaigns against the Goths; and when he was recalled by an insulting message from the empress in 562, he is said to have invited this fiercest and rudest of the Teutonic clans to seize the spoils of Italy. Be this as it may, the Lombards, their ranks swelled by the Gepidae, whom they had lately conquered, and by the wrecks of other barbarian tribes, passed southward under their king Alboin in 568. The Herulian invaders had been but a band of adventurers; the Goths were an army; the Lombards, far more formidable, were a nation in movement. Pavia offered stubborn resistance; but after a three years' siege it was taken, and Alboin made it the capital of his new kingdom.

In order to understand the future history of Italy, it is necessary to form a clear conception of the method pursued by the Lombards in their conquest. Penetrating the peninsula, and advancing like a glacier or half-liquid stream of mud, they occupied the valley of the Po, and moved slowly downward through the centre of the country. Numerous as they were compared with their Gothic predecessors, they had not strength or multitude enough to occupy the whole peninsula. Venice, which since the days of Attila had offered an asylum to Roman refugees from the northern cities, was left untouched. So was Genoa with its Riviera. Ravenna, entrenched within her lagoons, remained a Greek city. Rome, protected by invincible prestige, escaped. The sea-coast cities of the south, and the islands, Sicily, Sardinia and Corsica, preserved their independence. Thus the Lombards neither occupied the extremities nor subjugated the brain-centre of the country. The strength of Alboin's kingdom was in the north; his capital, Pavia. As his people pressed southward, they omitted to possess themselves of the coasts; and what was worse for the future of these conquerors, the original impetus of the invasion was checked by the untimely murder of Alboin in 573. After this event, the semi-independent chiefs of the Lombard tribes, who had assumed the title of dukes from their Roman predecessors, seem to have been contented with consolidating their power in the districts each had occupied. The duchies of Spoletto in the centre, and of Benevento in the south, inserted wedge-like into the middle of the peninsula, and enclosing independent Rome, were but loosely united to the kingdom at Pavia. Italy was broken up into districts, each offering points for attack from without, and fostering the seeds of internal revolution. Three separate capitals must be discriminated—Pavia, the seat of the new Lombard kingdom; Ravenna, the garrison city of the Byzantine emperor; and Rome, the rallying point of the old nation, where the successor of St Peter was already beginning to assume that national protectorate which proved so influential in the future.

It is not necessary to write the history of the Lombard kingdom in full, but to lay the rule of the Lombards properly at first far more oppressive to the native population, and less intelligent of their old customs, than that of the Goths had been. Wherever the Lombards had the upper hand, they placed the country under military rule, resembling in its general character what we now know as the feudal system. Though there is reason to suppose that the Roman laws were still administered within the cities, yet the Lombard code was that of the kingdom; and the Lombards being Arians, they added the oppression of religious intolerance to that of martial despotism and barbarous cupidity. The Italians were reduced to the last extremity when Gregory the Great (590-604), having strengthened his position by diplomatic relations with the duchy of Spoleto, and brought about the conversion of the Lombards to orthodoxy, raised the cause of the remaining Roman population throughout Italy. The fruit of his policy, which made of Rome a counterpoise against the effete empire of the Greeks upon the one hand and against the pressure of the feudal kingdom on the other, was seen in the succeeding century. When Leo the Isaurian published his decrees against the worship of images in 726, Gregory II. allied himself with Liudprand, the Lombard king, threw off allegiance to Byzantium, and established the autonomy of Rome. This pope initiated the dangerous policy of playing one hostile force off against another with a view to securing independence. He used the Lombards in his struggle with the Greeks, leaving to his successors the duty of checking these unnatural alliances. This was accomplished by calling the Franks in against the Lombards. Liudprand pressed hard, not only upon the Greek dominions of the exarchate, but also upon Rome. His successors, Rachis and Aistolf, attempted to follow the same game of conquest. But the popes, Gregory III., Zachary and Stephen II., determining at any cost to espouse the national cause and to aggrandize their own office, continued to rely upon the Franks. Pippin twice crossed the Alps, and forced Aistolf to relinquish his acquisitions, including Ravenna, Pentapolis, the coast towns of Romagna and some cities in the duchy of Spoleto. These he handed over to the pope of Rome. This donation of Pippin in 756 confirmed the papal see in the protectorate of the Italic party, and conferred upon it sovereign rights. The virtual outcome of the contest carried on by Rome since the year 726 with Byzantium and Pavia was to place the popes in the position held by the Greek exarch, and to confirm the limitation of the Lombard kingdom. We must, however, be cautious to remember that the south of Italy was comparatively unaffected. The dukes of the Greek empire and the Lombard dukes of Benevento, together with a few autonomous commercial cities, still divided Italy below the Campagna of Rome (see Lombards).

II. Frankish Emperors.—The Franko-Papal alliance, which conferred a crown on Pippin and sovereign rights upon the see of Rome, held within itself that ideal of mutually supporting papacy and empire which exercised so powerful an influence in medieval history. When Charles the Great (Charlemagne) deposed his father-in-law Desiderius, the last Lombard king, in 774, and when he received the circle of the empire from Leo III. at Rome in 800, he did but complete and ratify the compact offered to his grandfather, Charles Martel, by Gregory II. The relations between the new emperor and the pope were ill defined; and this proved the source of infinite disasters to Italy and Europe in the sequel. But for the moment each seemed necessary to the other; and that sufficed. Charles took possession of the kingdom of Italy, as limited by Pippin's settlement. The pope was confirmed in his rectorship of the cities ceded by Aistolf, with the further understanding, tacit rather than expressed, that even as he had wrung these provinces for the Italic people from both Greeks and Lombards, so in the future he might claim the protectorate of such portions of Italy, external to the kingdom, as he should be able to acquire. This, at any rate, seems to be the meaning of that obscure re-settlement of the peninsula which Charles effected. The kingdom of Italy, transmitted on his death by Charles the Great, and afterwards confirmed to his grandson Lothar by the peace of Verdun in 843, stretched from the Alps to the Adriatic, but had no recognized tributary, but independent. The cities of Gaeta and Naples, Sicily and the so-called Theme of Lombardy in South Apulia and Calabria, still recognized the Byzantine emperor. Venice stood aloof, professing a nominal allegiance to the East. The parcels into which the Lombards had divided the peninsula remained thus virtually unaltered, except for the new authority acquired by the see of Rome.

Internally Charles left the affairs of the Italian kingdom
ITALY

much as he found them, except that he appears to have pursued the policy of breaking up the larger fiefs of the Lombards, substituting counts for their dukes, and adding to the privileges of the bishops. We may reckon these measures among the earliest advantages extended to the cities, which still contained the bulk of the old Roman population, and which were destined to intervene with decisive effect two centuries later in Italian history. It should also here be noticed that the changes introduced into the holding of the fiefs, whether by altering their boundaries or substituting Frankish for Lombard vassals, were chief among the causes why the feudal system took no permanent hold in Italy. Feudalism was not at any time a national institution. The hierarchy of dukes and marquises and counts consisted of foreign soldiers imposed on the indigenous inhabitants; and the rapid succession of conquerors, Lombards, Franks and Germans following each other at no long interval, and each endeavouring to weaken the remaining strength of his predecessor, prevented this alien hierarchy from acquiring fixity by permanence of tenure. Among the many miseries inflicted upon Italy by the frequent changes of her northern rulers, this at least may be reckoned a blessing.

The Italians acknowledged eight kings of the house of Charles the Great, ending in Charles the Fat, who was deposed in 888. And it was the fashion to convey them into a dream, and have been renamed Italians by writers too eager to catch at any resemblance of national glory for a people passive in the hands of foreign masters. The truth is that no period in Italian history was less really glorious than that which came to a close in 961 by Berengar II.'s cession of his rights to Otto the Great. It was a period marked in the first place by the conquests of the Saracens, who began to occupy Sicily early in the 9th century, overran Calabria and Apulia, took Bari and threatened Rome. In the second place it was marked by a restoration of the Greeks to power. In 890 they established themselves again at Bari, and ruled the Theme of Lombardy by means of an officer entitled Catapan. In the third place it was marked by a decline of good government in Rome. Early in the 10th century the papacy fell into the hands of a noble family, known eventually as the counts of Tusculum, who almost succeeded in rendering the office hereditary, and in uniting the civil and ecclesiastical functions of the city under a single member of their house. It is not necessary to relate the scandals of Maria's and Theodora's female reign, the infamies of John XII., or the still more obscure episcopacy of the Franks, known as the period of Tusculum.

The most important fact for the historian of Italy to notice is that during this time the popes abandoned, not only their high duties as chiefs of Christendom, but also their protectorate of Italian liberties. A fourth humiliating episode in this period was the invasion of the Magyar barbarians, who overran the north of Italy, and reduced its fairest provinces to the condition of a wilderness. Anarchy and misery are indeed the main features of that long space of time which elapsed between the death of Charles the Great and the descent of Otto. Through the almost impenetrable darkness and confusion we only discern this much, that Italy was powerless to constitute herself a nation.

The discords which followed on the break-up of the Carolingian power, and the weakness of the so-called Italian emperors, who were unable to control the feudatories (marquises of Ivrea and Tuscany, dukes of Friuli and Spoleto), from whose ranks they sprang, exposed Italy to ever-increasing misrule. The country by this time had become thickly covered over with castles, the seats of greater or lesser nobles, all of whom were eager to detach themselves from the sway of the single city, and become petty lords. The cities, exposed to pillage by Huns in the north and Saracens in the south, and ravaged on the coast by Norse pirates, asserted their right to enclose themselves with walls, and taught their burgheers the use of arms. Within the circuit of their ramparts, the bishops already began to exercise authority in rivalry with the counts, to whom, since the days of Theodoric, had been entrusted the government of the Italian burgheers. Agreeably to feudal customs, these nobles, as they grew in power, retired from the town, and built themselves fortresses on points of vantage in the neighbourhood. Thus the titular king of Italy found himself simultaneously at war with those great vassals who had chosen him from their own class, with the turbulent factions of the Roman aristocracy, with unruly bishops in the growing cities and with the multitude of minor counts and barons who occupied the open lands, and who changed sides according to the interests of the moment. The last king of the quasi-Italian succession, Berengar II., marquis of Ivrea (951–961), made a vigorous effort to restore the authority of the regno; and had he succeeded, it is not impossible that now at the last moment Italy might have become an independent nation. But this attempt at unification was reckoned to Berengar for a crime. He only won the hatred of all classes, and was represented by the obscure annalists of that period as an oppressor of the church and a remorseless tyrant. In Italy, divided between feudal nobles and almost hereditary ecclesiastics, of foreign blood and alien sympathies, there was no national feeling. Berengar stood alone against a multitude, unanimous in their intolerance of discipline. His predecessor in the kingdom, Lothar, had left a young and beautiful widow, Adelheid. Berengar imprisoned her upon the Lake of Como, and threatened her with a forced marriage to his son Adalbert. She escaped to the castle of Canossa, where the emperor, Charles the Fat, placed himself at her disposal, and sailed for Italy to her behalf to Otto the Saxon. The king of Germany descended into Italy, and took Adelheid in marriage. After this episode Berengar was more discredited and impotent than ever. In the extremity of his fortunes he had recourse himself to Otto, making a formal cession of the Italian kingdom, in his own name and that of his son Adalbert, to the Saxon as his overlord. By this slender tie the crown of Italy was joined to that of Germany; and the formal right of the elected king of Germany to be considered king of Italy and emperor may be held to have accrued from this epoch.

III. The German Emperors.—Berengar gained nothing by his act of obedience to Otto. The great Italian nobles, in their turn, appealed to Germany. Otto entered Lombardy in 961, deposed Berengar, assumed the crown in San Ambrogio at Milan, and in 962 was proclaimed emperor by John XII. at Rome. Henceforward Italy changed masters according as one or other of the German families assumed supremacy beyond the Alps. It is one of the strongest instances furnished by history of the fascination produced by an ideal that once might have been considered, and which the Germans now would have to glory in this dependence of their nation upon Caesars who had nothing but a name in common with the Roman Emperor of the past.

The first thing we have to notice in this revolution which placed Otto the Great upon the imperial throne is that the Italian kingdom, founded by the Lombards, recognized by the Franks and recently claimed by eminent Italian feudatories, virtually ceased to exist. It was merged in the German kingdom; and, since for the German princes Germany was of necessity their first care, Italy from this time forward began to be left more and more to herself. The central authority of Pavia had always been weak; the regno had proved insufficient to combine the nation. But now even that shadow of union disappeared, and the Italians were abandoned to the slowly working influences which tended to divide them into separate states. The most brilliant period of their chequered history, the period which includes the rise of communes, the exchange of municipal liberty for despotism and the gradual discrimination of the five great powers (Milan, Venice, Florence, the Papacy and the kingdom of Naples), now began. Among the centrifugal forces which determined the future of the Italian race must be reckoned, first and foremost, the new spirit of municipal independence. We have seen how the cities enclosed themselves with walls, and how the bishops defined their authority against that of the counts. Otto encouraged this revolution by placing the enclosures of the chief burgheers beyond the jurisdiction of the counts. Within those precincts the bishops and the citizens were independent of all feudal masters but the emperor. He further
broke the power of the great vassals by redivisions of their feuds, and by the creation of new marches which he assigned to his German followers. In this way, owing to the dislocation of the ancient aristocracy, to the enlarged jurisdiction of a power so democratic as the episcopate, and to the increased privileges of the burghs, feudalism received a powerful check in Italy. The Italian people, that people which gave to the world the commerce and the arts of Florence, was not indeed as yet apparent. But the conditions under which it could arise, casting from itself all foreign and feudal trammels, recognizing its true past in ancient Rome, and reconstructing a civility out of the ruins of those glorious memories, were now at last granted. The nobles from this time forward retired into the country and the mountains, fortified themselves in strong places outside the cities, and gave their best attention to fostering the rural population. Within the cities and upon the open lands the Italians, in this and the next century, doubled, trebled and quadrupled their numbers. A race was formed strong enough to keep the empire itself in check, strong enough, except for its own internecine contests, to have formed a nation equal to its happier neighbours.

The recent disorders of the papacy induced Otto to deprive the Romans of their right to elect popes. But when he died in 973, his son Otto II. (married to Theophano of the imperial Byzantine house) and his grandson, Otto III., who descended into Italy in 996, found that the affairs of Rome and of the southern provinces were more than even their imperial powers could cope with. The faction of the counts of Tusculum raised its head from time to time in the Eternal City, and Rome still claimed to be a commonwealth. Otto III.'s untimely death in 1002 introduced new discord. Rome fell once more into the hands of her nobles. The Lomards chose Ardon, marquis of Ivrea, for king, and Pavia supported his claims against those of Henry of Bavaria, who had been elected in Germany. Milan sided with Henry; and this is perhaps the first eminent instance of cities being reckoned powerful allies in the Italian disputes of sovereigns. It is also the first instance of that bitter feud between the two great capitals of Lombardy, a feud rooted in ancient antipathies between the Roman population of Mediolanum and the Lombard garrison of Albino's successors, which proved so disastrous to the national cause. Ardon retired to a monastery, where he died in 1015. Henry, not long after, had the Pavia, was crowned in Rome and died in 1024. After this event, Heribert, the archbishop of Milan, invited Conrad, the Franconian king of Germany, into Italy, and crowned him with the iron crown of the kingdom.

The intervention of this man, Heribert, compels us to turn a closer glance upon the cities of North Italy. It is here, at the present epoch and for the next two centuries, that the pith and nerve of the Italian nation must be sought; and among the burghs of Lombardy, Milan, the eldest daughter of ancient Rome, assumes the lead. In Milan we hear for the first time the word Comune. In Milan the citizens first form themselves into a Parlamento. In Milan the archbishop organizes the hitherto voiceless, defenceless population into a community capable of expressing its needs, and an army ready to maintain its rights. To Heribert is attributed the invention of the Carroccio, which played so singular and important a part in the warfare of Italian cities. A huge car drawn by oxen, bearing the standard of the burgh, and carrying an altar with the host, this carroccio, like the ark of the covenant, was a rallying point for the armed artisans that they had a city and a church to fight for. That Heribert's device proved effectual in raising the spirit of his burghers, and consolidating them into a formidable band of warriors, is shown by the fact that it was speedily adopted in all the free cities. It must not, however, be supposed that at this epoch the liberties of the burghs were fully developed. The mass of the people remained unrepresented in the government; and even if the consuls existed in the days of Heribert, they were but humble legal officers, transacting business for their constituents in the courts of the bishop and his viscount. It still needed nearly a century of struggle to render the burghers independent of lordship, with a fully organized commune, self-governed in its several assembles. While making these reservations, it is at the same time right to observe that certain Italian communities were more advanced upon the path of independence than others. This is especially the case with the maritime ports. Not to mention Venice, which has not yet entered the Italian community, and remains a Greek free city, Genoa and Pisa were rapidly rising into ill-defined autonomy. Their command of fleets gave them incontestable advantages, as when, for instance, Otto II. employed the Pisans in 980 against the Greeks in Lower Italy, and the Pisans and Genoese together attacked the Saracens of Sardinia in 1017. Still, speaking generally, the age of independence for the burghs had only begun when Heribert from Milan undertook the earliest organization of a force that was to become paramount in peace and war.

Next to Milan, and from the point of view of general politics even more than St. Peter should assume. The destinies of Italy depended upon the character which the see of Rome should assume. Even the liberties of her republics in the north hung on the issue of this question which in the 11th and 12th centuries remains to Europe its farthest boundaries. So fatally were the internal affairs of that magnificent but unhappy country bound up with concerns which brought the forces of the civilized world into play. Her ancient prestige, her geographical position and the intellectual primacy of her most noble children rendered Italy the battleground of principles that set all Christendom in motion, and by the clash of which she found herself for ever afterwards divided. During the reign of Conrad II., the party of the counts of Tusculum revived in Rome; and Crescentius, claiming the title of consul in the imperial city, sought once more to control the election of the popes. When Henry III., the son of Conrad, entered Italy in 1046, he found three popes in Rome. These he abolished, and, taking the appointment into his own hands, gave German bishops to the see. The policy thus initiated upon the precedent laid down by Otto the Great was a remedy for pressing evils. It saved Rome from becoming a duchy in the hands of the Tusculum house. But it neither raised the prestige of the papacy, nor could it satisfy the Italians, who rightly regarded the Roman see as their own. These German popes were short-lived but inoffensive. Their appointment and the change of power which defined themselves within the church at this epoch, was simoniacal; and during the long minority of Henry IV., who succeeded his father in 1056, the terrible Tuscan monk, Hildebrand of Soana, forged weapons which he used with deadly effect against the presumptuous of the empire. The condition of the church seemed desperate, unless it could be purged of crying scandals—of the subjection of the papacy to the great Roman nobles, of its subordination to the German emperor and of its internal demoralization. It was Hildebrand's policy throughout three papacies, during which he controlled the counsels of the Vatican, and before he himself assumed the tiara, to prepare the mind of Italy and Europe for a mighty change. His programme included these three points: (1) the celibacy of the clergy; (2) the abolition of ecclesiastical appointments made by the secular authority; (3) the vesting of the papal election in the hands of the Roman clergy and people, presided over by the curia of cardinals. How Hildebrand paved the way for these reforms during the pontificates of Nicholas II. and Alexander II., and how they were furthered in Nicholas III. and Innocent III. is a matter of history, not of this book. Its depth of degradation and subjection to illimitable sway over the minds of men in Europe, and how his warfare with the empire established on a solid basis the still doubtful independence of the Italian burghs, renewing the long neglected protectorate of the Italian race, and bequeathing to his successors a national policy which had been forgotten by the popes since his great predecessor Gregory II., forms a chapter in European history which must now be interrupted. We have to follow the fortunes of unexpected allies, upon whom in no small measure his success depended.
In order to maintain some thread of continuity through the perplexed and tangled vicissitudes of the Italian race, it has been necessary to disregard those provinces which did not immediately contribute to the formation of its history. For this reason we have left the whole of the south up to the present point unnoticed. Sicily in the hands of the Mussulmans, the Theme of Lombardy abandoned to the weak suzerainty of the Greek catapans, the Lombard duchy of Benevento slowly falling to pieces and the maritime republics of Naples, Gaeta and Amalfi extending their influence by commerce in the Mediterranean, were in effect detached from the Italian regno, beyond the jurisdiction of Rome, included in no parcel of Italy proper. But now the moment had arrived when this vast group of provinces, forming the future kingdom of the Two Sicilies, was about to enter definitely and decisively within the bounds of the Italian community. Some Norman adventurers, on the peninsula "St. Michael, though Nonius, Ga from time to their swords in 1017 to the Lombard cities of Apulia against the Greeks. Twelve years later we find the Normans settled at Aversa under their Count Ranulf. From this station as a centre the little band of adventurers, playing the Greeks off against the Lombards, and the Lombards against the Greeks, spread their power in all directions, until they made themselves the most considerable force in southern Italy. William of Hauteville was proclaimed count of Apulia. His half-brother, Robert Wiskard or Guiscard, after defeating the papal troops at Civitella in 1055, received from Leo IX. the investiture of all present and future conquests in Apulia, Calabria and Sicily, which he agreed to hold as fiefs of the Holy See. Nicholas II. ratified this grant, and confirmed the title of count. Having consolidated their possessions on the mainland, the Normans, under Robert Guiscard's brother, the great Count Roger, undertook the conquest of Sicily in 1060. After a prolonged struggle of thirty years, they wrested the whole island from the Saracens; and Roger, dying in 1101, bequeathed to his son Roger a kingdom in Calabria and Sicily second to none in Europe for wealth and magnificence. This, while the elder branch of the Hauteville family still held the title and domains of the Apulian duchy; but in 1127, upon the death of his cousin Duke William, Roger united the whole of the future realm. In 1130 he assumed the style of king of Sicily, inscribing upon his sword the famous hexameter—

"Appus et Calaber Siculus mihi servit et Afer."

This Norman conquest of the two Sicilies forms the most romantic episode in medieval Italian history. By the consolidation of Apulia, Calabria and Sicily into a powerful kingdom, by checking the growth of the maritime republics and by recognizing the over-lordship of the papal see, the house of Hauteville influenced the destinies of Italy with more effect than any of the princes who had previously dealt with any portion of the peninsula. But in 1127, when the Normans had held the island for nearly a century, they had lost the cohesion they had given it; and all the disturbances of equilibrium in Italy were due in after days to papal manipulation of the rights acquired by Robert Guiscard's act of homage. The southern regno, in the hands of the kings, proved an insurmountable obstacle to the unification of Italy, led to French interference in Italian affairs, introduced the Spaniard and maintained in those rich southern provinces the reality of feudal sovereignty after this alien element had been eliminated from the rest of Italy (see Normans; Sicily: History).

For the sake of clearness, we have anticipated the course of events by nearly a century. We must now return to the date of Hildebrand's elevation to the papacy in 1073, when he chose the memorable name of Gregory VII. In the next year after his election Hildebrand convened a council, and passed measures enforcing the celibacy of the clergy. In 1075 he caused the investiture of ecclesiastical dignitaries by secular potentates of any degree to be condemned. These two reforms, striking at the most cherished privileges and most deeply-rooted self-indulgences of the aristocratic caste in Europe, inflamed the bitterest hostility. Henry IV., king of Germany, but not crowned emperor, convened a diet in the following year at Worms, where Gregory was deposed and excommunicated. The pope followed with a counter excommunication, far more formidable, releasing the king's subjects from their oaths of allegiance. War was thus declared between the two chiefs of western Christendom, that war of investitures which outlasted the lives of both Gregory and Henry, and was not terminated till the year 1122. The dramatic episodes of this struggle are too well known to be enlarged upon. In his single-handed duel with the strength of Germany, Gregory received material assistance from the Countess Matilda of Tuscany. She was the last heiress of the great house of Canossa, whose feuds stretched from Mantua across Lombardy, passed the Apennines, included the Tuscan plains, and embraced a portion of the duchy of Spoleto. It was in her castle of Canossa that Henry IV. performed his three days' penance in the winter of 1077; and there she made the cession of her vast domains to the church. That cession, renewed after the death of Gregory to his successors, crumbled upon the popes' indefinite rights, of which they afterwards availed themselves in the consolidation of their temporal power. Matilda died in the year 1115. Gregory had passed before her from the scene of his contest, an exile at Salerno, whither Robert Guiscard carried him in 1084 from the anarchy of rebellious Rome. With unbroken spirit, though the objects of his life were unattained, though Italy and Europe had been thrown into confusion, and the issue of the conflict was still doubtful, Gregory expired in 1085 with these words on his lips: "I loved justice, I hated iniquity, therefore in banishment I die."

The greatest of the popes thus breathed his last; but the new spirit he had communicated to the papacy was not destined to expire with him. Gregory's immediate successors, Victor III., Urban II. and Paschal II., carried on his struggle with Henry IV. and his imperial antipopes, encouraging the emperor's son to rebel against him, and stirring up Europe for the first crusade. When Henry IV. died, his own son's prisoner, in 1106, Henry V. crossed the Alps, entered Rome, wrung the imperial coronation from Paschal II. and compelled the pope to grant his claims on the investitures. Scarcely had he returned to Germany when the Lateran disavowed all that the pope had done, on the score that it had been exerted by force. France sided with the church. Germany rejected the bull of investiture. A new descent into Italy, a new seizure of Rome, proved of no avail. The emperor's real weakness was in Germany, where his subjects openly expressed their discontent. He at last abandoned the contest which had distracted Europe. By the concordat of Worms, 1122, the emperor surrendered the right of investiture by ring and staff, and granted the right of election to the clergy. The popes were henceforth to be chosen by the cardinals, the bishops by the chapters subject to the pope's approval. On the other hand the pope ceded to the emperor the right of investiture by the sceptre. But the main issue of the struggle was not in these details of ecclesiastical government; principles had been at stake far deeper and more widely reaching. The respective relations of pope and emperor, ill-defined in the compact between Charles the Great and Leo III., were brought in question, and the two chief potentates of Christendom, no longer tacitly concordant, stood against each other in irreconcilable rivalry. Upon this point, though the battle seemed to be a drawn one, the popes were really victors. They remained independent of the emperor, but the emperor had still to seek the crown at their hands. The pretensions of Otto the Great and Henry III. to make popes were gone for ever (see Papacy; Investitures).

IV. Age of the Communes.—The final gainers, however, by the war of investitures were the Italians. In the first place, from this time forward, owing to the election of popes by the Roman curia, the Holy See remained in the hands of Italians; and this, though it was by no means an unmixed good, was a great glory to the nation. In the next place, the antagonism of the popes to the emperors, which became hereditary in the Holy College, forced the former to assume the protectorate of the national cause. But by far the greatest profit the Italians reaped was the emancipation of their...
In reality, Imitations of the Lombard civic system. The patrician stood for the consuls. The senate, composed of nobles, represented the consody and the gran consilgo. The pope was unable to check this revolution, which is now chiefly interesting as further proof of the insurrection of the Latin as against the feudal elements in Italy at this period (see Rome: History).

Though the communes gained so much by the war of investitures, the division of the country between the pope’s and emperor’s parties was no small price to pay for independence. It conflicted upon Italy the ineradicable curse of party-warfare, setting city against city, house against house, and rendering concordant action for a national end impossible. No sooner had the compromise of the investitures been concluded than it was manifest that the burghers of the new enfranchised communes were resolved to turn their arms against each other. We seek in vain an obvious motive for each separate quarrel. All we know for certain is that, at this epoch, Rome attempts to ruin Tivoli, and Venice Pisa; Milan fights with Cremona, Cremona with Crema, Pavia with Verona, Verona with Padua, Piacenza with Parma, Modena and Reggio with Bologna, Bologna and Ferrare with Ravenna and Imola, Florence and Pisa with Lucca and Siena, and so on through the whole list of cities. The nearer the neighbours, the more rancorous and internecine is the strife; and, as in all cases where animosity is deadly and no grave local causes of dispute are apparent, we are bound to conclude that some deeply-seated permanent uneasiness goaded these fast growing communities into rivalry. Italy was, in fact, too small for her children. As the towns expanded, they perceived that they must mutually exclude each other. They fought for bare existence, for primacy in commerce, for the command of seaports, for the keys of mountain passes, for rivers, roads and all the avenues of wealth and plenty. The pope’s cause and the emperor’s cause were of comparatively little moment to Italian burghers; and the names of Guelph and Ghibelline, which before long began to be heard in every street, on every market-place, had no meaning for them. These watchwords are said to have arisen in Germany during the disputed succession of the empire between 1135 and 1153, when the Wels of Bavaria opposed the Swabian princes of Waiblingen. But in Italy, although they were severally identified with the papal and imperial parties, they really served as symbols for jealousies which altered in complexion from time to time and place to place, expressing more than antagonistic political principles, and involving differences vital enough to split the social fabric to its foundation.

Under the imperial rule of Lothar the Saxon (1125-1137) and Conrad the Swabian (1138-1152), these civil wars increased in violence owing to the absence of authority. Neither Lothar nor Conrad was strong at home; the former had no influence in Italy, and the latter never entered Italy at all. But when Conrad died, the electors chose his nephew Frederick, surnamed Barbarossa, who united the rival honours of Welf and Waiblingen, to succeed him; and it was soon obvious that the empire had a master powerful of brain and firm of will. Frederick immediately determined to reassert the imperial rights in the southern provinces, and to check the wastee of the Lombard burghs. When he first crossed the Alps in 1154, Lombardy was, roughly speaking, divided between two parties, the one headed by Pavia professing loyalty to the empire, the other headed by Milan ready to oppose its claims. The municipal anomolies of the last quarter of a century gave substance to these factions; yet neither the imperial nor the anti-imperial party had any real community of interest with Frederick. He came to supersede self-government by consuls, to deprive the cities of the privilege of making war on their own account and to extort his regalian rights of forage, food and lodging for his armies. It was only the habit of interurban jealousy which prevented the communes from at once combining to resist demands which threatened their liberty of action, and would leave them passive at the pleasure of a foreign master. The diet was opened at Roncaglia near Piacenza, where Frederick
listened to the complaints of Como and Lodi against Milan, of Pavia against Tortona and of the marquis of Montferrat against Asti and Chieri. The plaintiffs in each case were imperialists; and Frederick's first action was to redress their supposed grievances. He laid waste Chieri, Asti and Tortona, then took the Lombard crown at Pavia, and, refusing Milan for a future day, passed southward to Rome. Outside the gates of Rome he was met by a deputation from the senate he had come to supersede, who addressed him in words memorable for expressing the republican spirit of new Italy face to face with autocratic feudalism: "Thou want a stranger, I have made thee a citizen "; it is Rome who speaks: "Thou camest as an alien from beyond the Alps, I have conferred on thee the principality." Moved only to scorn and indignation by the rhetoric of these presumptuous enthusiasts, Frederick marched into the Leonine city, and took the imperial crown from the hands of Adrian IV. In return for this compliance, the emperor delivered over to the pope his troublesome rival Arnold of Brescia, who was burned alive by Nicholas Breaskpear, the only English successor of St Peter. The gates of Rome itself were shut against Frederick; and even on this first occasion his good understanding with Adrian began to suffer. The points of dispute between them related mainly to Matilda's bequest, and to the kingdom of Sicily, which the pope had rendered independent of the empire by renewing its investiture in the name of the Holy See. In truth, the papacy and the empire had become irreconcilable. Each claimed illimitable authority, and neither was content to abide within such limits as would have secured a mutual tolerance. Having obtained his coronation, Frederick withdrew to Germany, while Milan prepared herself against the storm which threatened. In the ensuing struggle with the empire, that great city rose to the altitude of patriotic heroism. By their sufferings no less than by their deeds of daring, her citizens showed themselves to be sublime, devoted and disinterested, winning the purest laurels which give lustre to Italian story. Almost in Frederick's presence, they rebuilt Tortona, punished Pavia, Lodi, Cremona and the marquis of Montferrat. Then they fortified the Adra and Ticino, and waited for the emperor's next descent. He came in 1158 with a large army, overran Lombardy, raised his imperial allies, and sat down before the walls of Milan. Famine forced the burghers to partial obedience, and Frederick held a victorious diet at Roncaglia. Here the jurists of Bologna appeared, armed with their new lore of Roman law, and ex- pounded Justinian's code in the interests of the German empire. It was now seen how the absolutist doctrines of autocracy developed in Justinian's age at Byzantium would bear fruits in the development of an imperial idea, which was destined to be the fatal mirage of medieval Italy. Frederick placed judges of his own appointment, with the title of podestà, in all the Lombard communes; and this stretch of his authority, while it exacer-bated his foes, forced even his friends to join their ranks against him. The war, meanwhile, dragged on. Crema yielded after an heroic siege in 1160, and was abandoned to the cruelty of its fiercest imperialists. Milan and Asti, starved into capitulation after nine months' resistance, and given up to total destruction by the Italian imperialists of Frederick's army, so stained and tarnished with the vindictive passions of municipal rivalry was even this, the one great glorious strife of Italian annals. Having ruined his rebellious city, but not tamed her spirit, Frederick withdrew across the Alps. But, in the interval between his second and third visit, a league was formed against him in north-eastern Lombardy. Verona, Vicenza, Padua, Treviso, Venice entered into a compact to defend their liberties; and when he came again in 1163 with a brilliant staff of German knights, the imperial cities refused to join his standards. This was the first and ominous sign of a coming change.

Meanwhile the election of Alexander III. to the papacy in 1159 added a powerful ally to the republican party. Opposed by an anti-pope whom the emperor favoured, Alexander found it was his truest policy to rely for support upon the anti-imperialist communes. They in return gladly accepted a champion who lent them the prestige and influence of the church. When Frederick once more crossed the Alps in 1166, he advanced on Rome, and besieged Alexander in the Coliseum. But the affairs of Lombardy left him no leisure to prosecute a recalcitrant pontiff. In April 1167 a new league was formed between Cremona, Bergamo, Brescia, Mantua and Ferrara. In December of the same year this league allied itself with the elder Veronese league, and received the addition of Milan, Lodi, Piacenza, Parma, Modena and Bologna. The famous league of Lombard cities, styled Concordia in its acts of settlement, was now established. Novara, Vercelli, Asti and Tortona swelled its ranks; only Pavia and Montferrat remained imperialist between the Alps and Apenines. Frederick fled for his life by the Mont Cenis, and in 1168 the town of Alessandria was erected to keep Pavia and the marquisate in check. In the emperor's absence, Ravenna, Rimini, Imola and Forlì joined the league, which now called itself the "Society of Venice, Lombardy, the March, Romagna and Alessandria." For the fifth time, in 1174, Frederick entered his rebellious dominions. The fortress town of Alessandria stopped his progress with those mud walls contemptuously named "of straw," while the forces of the league assembled at Modena and obliged him to raise the siege. In the spring of 1176 Frederick threatened Milan. His army found itself a little to the north of the town near the village of Legnano, when the troops of the city, assisted only by a few allies from Piacenza, Verona, Brescia, Novara and Vercelli, met and overwhelmed it. The victory was complete. Frederick escaped alone to Pavia, whence he opened negotiations with Alexander. In consequence of these transactions, he was suffered to betake himself unharmed to Venice. Here, as upon neutral ground, the emperor met the pope, and a truce for six years was concluded with the Lombard burghs. Looking back from the vantage-ground of history upon the issue of this long struggle, we are struck with the small results which satisfied the Lombard communes. They had humbled and utterly defeated their foreign lord. They had proved their strength in combination. Yet neither the acts by which their league was ratified nor the terms negotiated for them by their patron emperor evince the smallest desire of what we now understand as national independence. The name of Italy is never mentioned.

The supremacy of the emperor is not called in question. The conception of a permanent confederation, bound together in offensive and defensive alliance for common objects, has not occurred to these hard fighters and stubborn asserters of their civic privileges. All they claim is municipal autonomy; the right to manage their own affairs within the city walls, to fight their battles as they choose, and to follow their several ends unchecked. It is vain to lament that, when they might have now established Italian independence upon a secure basis, they chose local and municipal privileges. Their mutual jealousies, combined with the prestige of the empire, and possibly with the selfishness of the pope, who had secured his own position, and was not likely to foster a national spirit that would have threatened the ecclesiastical supremacy, deprived the Italians of the only great opportunity they ever had of forming themselves into a powerful nation.

When the truce expired in 1183, a permanent peace was ratified at Constance. The intervening years had been spent by the Lombards, not in consolidating their union, but in attempting to secure special privileges for their several cities. Alessandria della Paglia, glorious by her resistance to the emperor in 1174, had even changed her name to Cesarea! The signatories of the peace of Constance were divided between leagues and imperialists. On the one side we find Vercelli, Novara, Milan, Lodi, Bergamo, Brescia, Mantua, Verona, Vicenza, Padua, Treviso, Bologna, Faenza, Modena, Reggio, Parma, Piacenza; on the other, Pavia, Genoa, Alba, Cremona, Como, Tortona, Asti, Cesarea. Venice, who had not yet entered the Italian community, is conspicuous by her absence. According to the terms of the treaty, the communes were confirmed in their right of self-government by consuls, and their right of warfare. The emperor retained the supreme courts of appeal within the cities, and
his claim for sustenance at their expense when he came into Italy.

The privileges confirmed to the Lombard cities by the peace of Constance were extended to Tuscany, where Florence, having ruined Fiesole, had begun her career of freedom and prosperity. The next great chapter in the history of Italian evolution is the war of the burghers against the nobles. The consular cities were everywhere surrounded by castles; and, though the feudal lords had been weakened by the events of the preceding centuries, they continued to be formidable enemies. It was, for instance, necessary to the well-being of the towns that they should possess territory round their walls, and this had to be wrested from the nobles. We cannot linger over the details of this warfare. It must suffice to say that, partly by mortgaging their property to richburghers, partly by entering the service of the cities as condottieri (mercenary leaders), partly by espousing the cause of one town against another, and partly by forced submission after the siege of their strong places, the counts were gradually brought into connexion of dependence on the communes. These, in their turn, forced the nobles to leave their castles, and to reside for at least a portion of each year within the walls. By these measures the nobles became clients, the ruling classes ceased to rank as serfs, and the Italo-Roman population of the towns absorbed into itself the remnants of Franks, Germans and other foreign stocks. It would be impossible to exaggerate the importance of this revolution, which ended by destroying the last vestige of feudalism, and prepared that common Italian people which afterwards distinguished itself by the creation of European culture. But, like all the vicissitudes of the Italian race, while it was a decided step forward in one direction, it introduced a new source of discord. The associated nobles proved ill neighbours to the peaceable citizens. They fortified their houses, retained their military habits, defied the consuls, and carried on feuds in the streets and squares. The war against the castles became a war against the palaces; and the system of government by consuls proved inefficient to control the clashing elements within the state. This led to the establishment of podestàs, who represented a compromise between two radically hostile parties in the city, and whose business it was to arbitrate and keep the peace between them. Invariably a foreigner, elected for a year with power of life and death and control of the armed force, but subject to a strict account at the expiration of his office, the podestà might be compared to a dictator invested with limited authority. His title was derived from that of Frederick Barbarossa’s judges; but he had no dependence on the empire. The citizens chose him, and voluntarily submitted to his rule. The podestà marks an essentially transitional state in civic government, and his intervention paved the way for despotism.

The thirty years which elapsed between Frederick Barbarossa’s death in 1190 and the coronation of his grandson Frederick II. in 1220 form one of the most momentous epochs in Italian history. Barbarossa, perceiving the advantage that would accrue to his house if he could join the crown of Sicily to that of Germany, and thus deprive the popes of their allies in Lower Italy, procured the marriage of his son Henry VI. to Constance, daughter of King Roger, and heiress of the Hauteville dynasty. When William II., the last monarch of the Norman race, died, Henry VI. claimed that kingdom in his wife’s right, and was recognized in 1194. Three years afterwards he died, leaving a son, Frederick, to the care of Constance, who in her turn died in 1198, bequeathing the young prince, already crowned king of Germany, to the guardianship of Innocent III. It was bold policy to confide Frederick to his greatest enemy and rival; but the pope honourably discharged his duty, until his ward outgrew the years of tutelage, and became a fair mark for ecclesiastical hostility. Frederick’s long minority was occupied by Innocent’s pontificate. Among the principal events of that reign must be reckoned the foundation of the two orders, Franciscan and Dominican, who were destined to form a militia for the holy see in conflict with the empire and the heretics of Lombardy.

A second great event was the fourth crusade, undertaken in 1108, which established the naval and commercial supremacy of the Italians in the Mediterranean. The Venetians, who contracted for the transport of the crusaders, and whose blind doge Dandolo was first to land in Constantinople, received one-half and one-fourth of the divided Greek empire for their spoils. The Venetian ascendancy in the Levant dates from this epoch; for, though the republic had no power to occupy all the domains ceded to it, Candia was taken, together with several small islands and stations on the mainland. The formation of a Latin empire in the East increased the pope’s prestige; while at home it was his policy to organize Countess Matilda’s heritage by the formation of Guelph leagues, over which he presided. This is the meaning of the three leagues, in the March, in the Duchy of Spoleto and in Tuscany, which now combined the chief cities of the papal territory into allies of the holy see. From the Tuscan league Pisa, consistently Ghibelline, stood aloof. Rome itself again at this epoch established a republic, with which Innocent would not or could not interfere. The thirteen districts in their council nominated four esporioni, who acted in concert with a senatore, appointed, like the podestàs of other cities, for supreme judicial functions. Meanwhile the Guelphs and Ghibellines factions were beginning to divide Italy into civic factions. Not only did commune range itself against commune under the two rival flags, but party against party within the city walls. The introduction of the factions into Florence in 1215, owing to a private quarrel between the Buondelmonti, Amidei and Donati, is a celebrated instance of what was happening in every burg. Frederick II. was left without a rival for the imperial throne in 1218 by the death of Otto IV., and on the 22nd of November 1220, Honorius III., Innocent’s successor, crowned him in Rome. It was impossible for any section of the Italians to mistake the gravity of his access to power. In his single person he combined the prestige of empire with the crowns of Italy, Sicily, Sardinia, Germany and Burgundy; and in 1225, by marriage with Yolande de Brienne, he added that of Jerusalem. There was no prince greater or more formidable in the habitable globe. The communes, no less than the popes, felt that they must prepare themselves for contest with the death of a power which threatened their existence. Already in 1218, the Guelphs of Lombardy had reassassinated their old league, and had been defeated by the Ghibellines in a battle near Fiesole. Italy seemed to lie prostrate before the emperor, who commanded her for the first time from the throne of the north. In 1227 Frederick, who had promised to lead a crusade, was excommunicated by Gregory IX., because he was obliged by illness to defer his undertaking; and thus the spiritual power declared war upon its rival. The Guelph towns of Lombardy again raised their levies. Frederick enlisted his Saracen troops at Nocera and Luceria, and appointed the terrible Ezzelino da Romano his vicar in the Marches of Verona to quell their insurrection. It was 1236, however, before he was able to take the field himself against the Lombards. Having established Ezzelino in Verona, Vicenza and Padua, he defeated the Milanese and their allies at Cortenuova in 1237, and sent their carroccio as a trophy of his victory to Rome. Gregory IX. feared lest the Guelph party would be ruined by this check. He therefore made alliance with Venice and Genoa, furnished a new excommunication against Frederick, and convoked a council at Rome to ratify his ban in 1241. The Genoese undertook to bring the French bishops to this council. Their fleet was attacked at Meloria by the Pisans, and utterly defeated. The French prelates went on silver chains to prison in the Ghibelline capital of Tuscany. So Frederick had been successively banished and imprisoned, and in 1243 a new pope, Innocent IV., was elected, who prosecuted the war with still bitterer spirit. Forced to fly to France, he there, in 1245, convened a council, which enforced his condemnation of the emperor. Frederick’s subjects were freed from their allegiance, and he was declared dethroned and deprived of all rights. Five times king and emperor as he was, Frederick, placed under the ban of the church, led henceforth a doomed existence. The mendicant monks stirred up the populace to acts of fanatical
enmity. To plot against him, to attempt his life by poison or the sword, was accounted courteous. His secretary, Piero delle Vigne, was wrongly suspected of conspiring. The crimes of his vicar Ezzelino, who laid whole provinces waste and murdered men by thousands in his Paduan prisons, increased the horror with which he was regarded. Parma revolted from him, and he spent months in 1247-1248 vainly trying to reduce this one time faithful city. The only gleam of success which shone on his ill fortune was the revolution which placed Florence in the hands of the Ghibellines in 1248. Next year Bologna rose against him, defeated his troops and took his son Enzio, king of Sardinia, prisoner at Fossalta. Hunted to the ground and broken-hearted, Frederick expired at the end of 1250 in his Apullan castle of Florentino. It is difficult to judge his career with fairness. The only prince who could, with any probability of success, have established the German rule in Italy, his ruin proved the impossibility of that long-cherished scheme. The nation had outgrown dependence on foreigners, and after his death to German emperor interfered with anything but miserable failure in Italian affairs. Yet from many points of view it might be regretted that Frederick was not suffered to rule Italy. By birth and breeding an Italian, highly gifted and widely cultivated, liberal in his opinions, a patron of literature, a founder of universities, he anticipated the spirit of the Renaissance. At his court Italian started into being as a language. His laws were wise. He was capable of giving to Italy a large and noble culture. But the commanding greatness of his position proved his ruin. Emperor and king of Sicily, he was the natural enemy of popes, who could not tolerate so overwhelming a rival.

After Frederick’s death, the popes carried on their war for eighteen years against his descendants. The cause of his son Conrad was sustained in Lower Italy by Manfred, one of Frederick’s many natural children; and, when Conrad died in 1254, Manfred still acted as viceroy for the Swabians, who were now represented by a boy, Conradin. Innocent IV. and Alexander IV. continued to make head against the Ghibelline party. The most dramatic incident in this struggle was the crusade preached against Ezzelino. This tyrant had made himself justly odious; and when he was hunted to death in 1259, the triumph was less for the Guelph cause than for humanity outraged by the iniquities of such a monster. The battle between Guelph and Ghibelline raged with unintermitting fury. While the former faction gained in Lombardy by the massacre of Ezzelino, the latter revived in Tuscany after the battle of Montaperti, which in 1260 placed Florence at the discretion of the Ghibellines. Manfred, now called king of Sicily, headed the Ghibellines, and there was no strong counterpoise against him. In this necessity Urban IV. and Clement IV. invited Charles of Anjou to enter Italy and take the Guelph command. They made him senator of Rome and vicar of Tuscany, and promised him the investiture of the regno provided he stipulated that it should not be held in combination with the empire. Charles accepted these terms, and was welcomed by the Guelph party as their chief throughout Italy. He defeated Manfred in a battle at Grandella near Benevento in 1266. Manfred was killed; and, when Conradin, a lad of sixteen, descended from Germany to make good his claims to the kingdom, he too was defeated at Tagliacozzo in 1267. Less lucky than his uncle, Conradin escaped with his life, to die upon a scaffold at Naples. His glove was carried to his cousin Constance, wife of Peter of Aragon, the last of the great Norman-Swabian family. Enzio died in his prison four years later. The popes had been successful; but they had purchased their bloody victory at a great cost. This first invasion of French princes brought with it incalculable evils. Charles of Anjou supported by Rome, and recognized as chief in Tuscany, was by far the most formidable of the Italian potentates. In his turn he now excited the jealousy of the popes, who began, though cautiously, to cast their weight into the Ghibelline scale. Gregory initiated the policy of establishing an equilibrium between the parties, which was carried out by his successor Nicholas III. Charles was forced to resign the seneship of Rome and the signoria of Lombardy and Tuscany. In 1282 he received a more decided check, when Sicily rose against him in the famous rebellion of the Vespers. He lost the island, which gave itself to Aragon; and thus the kingdom of Sicily was severed from that of Naples, the dynasty in the one being Spanish and Ghibelline, in the other French and Guelph. Meanwhile a new emperor had been elected, the prudent Rudolf of Habsburg, who abstained from interference with Italy, and who confirmed the territorial pretensions of the popes by solemn charter in 1278. Henceforth Emilia, Romagna, the March of Ancona, the patrimony of St Peter and the Campania of Rome held the Holy See, and not of the empire. The imperial chancery, without inquiring closely into the deeds furnished by the papal curia, made a deed of gift, which placed the pope in the position of a temporal sovereign. While Nicholas III. thus bettered the position of the church in Italy, the Guelph party grew stronger than ever, through the crushing defeat of the Pisans by the Genoese at Meloria in 1284. Pisa, who had ruined Amalfi, was now ruined by Genoa. She never held her head so high again after this victory, which sent her best and bravest citizens to die in the Ligurian dungeons. The Mediterranean was left to be fought for by Genoa and Venice, while Guelph Florence grew still more powerful in Tuscany. Not long after the battle of Meloria Charles of Anjou died, and was succeeded by his son Charles II. of Naples, who played no prominent part in Italian affairs. The Guelph party was held together with a less tight hand even in cities so consistent as Florence. Here in the year 1300 new factions, subdividing the old Guelphs and Ghibellines under the names of Neri and Bianchi, had acquired such force that Boniface VIII., a violently Guelph pope, called in Charles of Valois to pacify the republic and undertake the charge of Italian affairs. Boniface was a passionate and unwise man. After quarrelling with the French king, Philip le Bel, he fell into the hands of the Colonna family at Anagni, and died, either of the violence he there received or of mortification, in October 1303.

After the short papacy of Benedict XI. a Frenchman, Clement V., was elected, and the seat of the papacy was transferred to Avignon. Thus began that Babylonian exile of the popes which placed them in subjection to the French crown and ruined their prestige in Italy. Lasting seventy years, and joining on to the sixty years of the Great Schism, this enfeeblement of the papal authority, coinciding as it did with the practical elimination of the empire from Italian affairs, gave a long period of comparative independence to the nation. Nor must it be forgotten that this exile was due to the policy which induced the pontiffs, in their detestation of Ghibellinism, to rely successively upon the Louises of Anjou and of Valois. This policy it was which justified Dante’s fierce epiagram—the putaneaggiar co regi.

The period we have briefly traversed was immortalized by Dante in an epic which from one point of view might be called the poem of the Guelphs and Ghibellines. From the foregoing bare narration of events it is impossible to estimate the importance of these parties, or to understand their bearing on subsequent Italian history. We are therefore forced to pause awhile, and probe beneath the surface. The civil wars may be regarded as a continuation of the previous municipal struggle, intensified by recent hostilities between the burghers and the nobles. The quarrels of the church and empire lend pretexts and furnish war-cries; but the real question at issue is not the supremacy of pope or emperor. The conflict is a social one, between civic and feudal institutions, between commercial and military interests, between professors and conservatives. Guelph de
tocracy and immobility idealize the pope. The banner of the church waves above the camp of those who aim at positive prosperity and republican equality. Ghibelline aristocracy and
or Ghibelline till it has expelled one-half of its inhabitants; for each party is resolved to constitute the state according to its own conception, and the affirmation of the one programme is the negation of the other. The Ghibelline honestly believes that the Guelphs will reduce society to chaos. The Guelph is persuaded that the Ghibelines will annihilate freedom and social commerce. The struggle is waged by two sets of men who equally love their city, but who would fain rule it upon diametrically opposite principles, and who fight to the death for its possession. This contradiction enters into the minutest details of life—armorial bearings, clothes, habits at table, symbolize and accentuate the difference. Meanwhile each party forms its own organization of chiefs, finance-officers and registrars at home, and sends ambassadors to foreign cities of the same complexion. A network of party policy embraces and dominates the burghs of Italy, bringing the most distant centres into relation, and by the very division of the country augmenting the sense of nationality. The Italians learn through their discords at this epoch that they form one community. The victory in the conflict practically falls to the hitherto unenfranchised plebeians. The elder noble families die out or lose their preponderance. In some cities, as notably in Florence after the date 1292, it becomes criminal to be scieverato, or unemployed in industry. New houses rise into importance; a new commercial aristocracy is formed. Burghers of all denominations are enrolled in one or other of the arts or gilds, and these trading companies furnish the material from which the government or signoria of the city is composed. Plebian handicrafts assert their right to be represented on an equality with learned professions and wealthy corporations. The ancient classes are confounded and obliterated in a population more homogeneous, more adapted for democracy and despotism.

In addition to the parliament and the councils which have been already enumerated, we now find a council of the party of the ancient or priors, chosen from the arts. A new magistrate, the gonfalonier of justice, appears in some of the Guelph cities, with the special duty of keeping the insolence of the nobility in check. Meanwhile the podestà still subsists; but he is no longer equal to the task of maintaining an equilibrium of forces. He sinks more and more into a judge, loses more and more the character of dictator. His ancient place is now occupied by a new functionary, no longer acting as arbiter, but concentrating the forces of the triumphant party. The captain of the people, acting as head of the ascendant Guelphs or Ghibelines, undertakes the responsibility of proscriptions, decides on questions of policy, forms alliances, declares war. Like all officers created to meet an emergency, the limitations to his power are ill-defined, and he is often little better than an autocrat.

V. Age of the Despots.—Thus the Italians, during the heat of the civil wars, were ostensibly divided between partisans of the empire and partisans of the church. After the death of Frederick II. their affairs were managed by Manfred and by Charles of Anjou, the supreme captains of the parties, under whose orders acted the captains of the people in each city. The contest being carried on by warfare, it followed that these captains in the burghs were chosen on account of military skill; and, since the nobles were men of arms by profession, members of ancient houses took the lead again in towns where they had been absorbed into the bourgeoisie. In this way, after the downfall of the Ezzelini of Romano, the della Scala dynasty arose in Verona, and the Carrarese in Padua. The Esteensi made themselves lords of Ferrara; the Torriani headed the Guelphs of Milan. At Ravenna we find the Polenta family, at Rimini the Malatestas, at Parma the Rossi, at Faenza the Scotti, at Faenza the Manfredi. There is not a burgh of northern Italy but can trace the rise of a dynastic house to the vicissitudes of this period. In Tuscany, where the Guelph party was very strongly organized, and the commercial constitution of Florence kept the nobility in check, the communes remained as yet free from hereditary masters. Yet generals from time to time arose, the Conte Ugolino della Gherardesca at Pisa, Uguccione della Faggiuola at Lucca, the Conte Guido di Montefeltro at Florence, who threatened the liberties of Tuscan cities with military despotism.

Left to themselves by absentee emperors and exiled popes, the Italians pursued their own course of development unchecked. After the commencement of the 14th century, the civil wars decreased in fury, and at the same time it was perceived that their effect had been to confirm tyrants in their grasp upon free cities. Growing up out of the captain of the people or signore of the commune, the tyrant annihilated both parties for his own profit and for the peace of the state. He used the dictatorial powers with which he was invested to place himself above the law, resuming in his person the state-machiney which had preceded him. In him, for the first time, the city attained self-consciousness, the blindly working forces of previous revolutions were combined in the will of a ruler. The tyrant's general policy was to favour the multitude at the expense of his own caste. He won favour by these means, and completed the levelling down of classes, which had been proceeding ever since the emergence of the communes.

In 1309 Robert, grandson of Charles, the first Angevine sovereign, succeeded to the throne of Naples, and became the leader of the Guelphs in Italy. In the next year Henry VII. of Luxembourg crossed the Alps soon after his election to the empire, and raised the hopes of the Ghibelines. Dante from his mountain solitudes passionately called upon him to play the part of a Messiah. But it was now impossible for any German to control the "Garden of the Empire." Italy had entered on a new phase of her existence, and the great poet's De monarchia represented a dream of the past which could not be realized. The Scaligers in Verona and the Carrarese in Padua were strengthened; and in Tuscany Castruccio Castracane, Uguccione's successor at Lucca, became formidable. In 1325 he defeated the Florentines at Alto Pascio, and carried home their carroccio as a trophy of his victory over the Ghibelles. Louis of Bavaria, the next emperor, made a similar excursion in the year 1327, with even greater loss of imperial prestige. He deposited Galeazzo Visconti on his downward journey, and offered Milan for a sum of money to his son Azzo upon his return. Castruccio Castracane was nominated by him duke of Lucca; and this is the first instance of a dynastic title conferred upon an Italian adventurer by the emperor. Castruccio dominated Tuscany, where the Guelph cause, in the weakness of King Robert, languished. But the adventurer's death in 1328 saved the stronghold of republican institutions, and Florence breathed freely for a while again. Can Grande della Scala's death in the next year inflicted on the Lombard Ghibelines a loss hardly inferior to that of Castruccio's on their Tuscan allies. Equally contemptible in its political results and void of historical interest was the brief visit of John of Bohemia, son of Henry VII., whom the Ghibelines next invited to assume their leadership. He sold a few privileges, conferred a few titles, and recrossed the Alps in 1333. It is clear that at this time the fury of the civil wars was spent. In spite of repeated efforts on the part of the Ghibelines, in spite of King Robert's incapacity, the imperialists gained no permanent advantage. The Italians were tired of fighting, and the leaders of both factions looked exclusively to their own interests. Each city which had been the cradle of freedom thankfully accepted a master, to quench the conflagration of party strife, encourage...
trade, and make the handicraftsmen comfortable. Even the Florentines in 1342 submitted for a few months to the despotism of the duke of Athens. They conferred the signory upon him for life; and, had he not mismanaged matters, he might have held the city in his grasp. Italy was settling down and turning her attention to home comforts, arts and literature. Boccaccio, the contented bourgeois, succeeded to Dante, the fierce aristocrat.

The most marked proof of the change which came over Italy towards the middle of the 14th century is furnished by the companies of adventurers. It was with their own militia that the burghers won freedom in the war of independence, subdued the nobles, and fought the battles of the parties. But from this time forward they laid down their arms, and played the game of warfare by the aid of mercenaries. Ecclesiastical overlords, interfering from a distance in Italian politics; prosperous republics, with plenty of money to spend but no leisure or inclination for camp-life; cautious tyrants, glad of every pretext to emasculate their subjects, and courting popularity by exchanging conflagration for taxation—all combined to favour the new system. Mercenary troops are said to have been first levied from disbanded mercenaries, together with Breton and English adventurers, whom the Visconti and Castruccio took into their pay. They soon appeared under their own captains, who hired them out to the highest bidder, or marched them on marauding expeditions up and down the less protected districts. The names of some of these earliest captains of adventure, Fra Moriale, Count Lando and Duke Werner, who styled himself the "Enemy of God and Mercy," have been preserved to us. As the companies grew in size and improved their discipline, it was seen by the Italian nobles that this kind of service offered a good career for men of spirit, who had learned the use of arms. To leave so powerful and profitable a calling in the hands of foreigners seemed both dangerous and uneconomical. Therefore, after the middle of the century, this profession fell into the hands of natives. The first Italian who formed an exclusively Italian company was Alberico da Barbiano, a nobleman of Romagna, and founder of the Milanese house of Della Rovere. In his school the great condottieri Braccio da Montone and Sforza, Attendolo were formed; and henceforth the battles of Italy were fought by Italian generals commanding native troops. This was better in some respects than if the mercenaries had been foreigners. Yet it must not be forgotten that the new companies of adventure, who decided Italian affairs for the next century, were in no sense patriotic. They sold themselves for money, irrespective of the cause which they upheld; and, while changing masters, they had no care for any interests but their own. The name condottiero, derived from condotta, a paid contract to supply so many fighting men in serviceable order, sufficiently indicates the nature of the business. In the hands of able captains, like Francesco Sforza or Piccinino, these mercenary troops became moving despotisms, draining the country of its wealth, and always eager to fasten and found tyrannies upon the provinces they had been summoned to defend. Their generals substituted heavy-armed cavalry for the old militia, and introduced systems of campaigning which reduced the art of war to a game of skill. Battles became all but bloodless; diplomacy and tactics superseded feats of arms and hard blows in pitched fields. In this way the Italians lost their military vigour, and wars were waged by despots from their cabinets, who pulled the strings of puppet captains in their pay. Nor were the people only enfeebled for resistance to a real foe; the whole political spirit of the race was demoralized. The purely selfish bond between condottieri and their employers, whether princes or republics, involved intrigues and treachery, checks and counterchecks, secret terror on the one hand and treasurable practice on the other, which ended by making statecraft in Italy synonymous with perfidy.

It must further be noticed that the rise of mercenaries was synchronous with a change in the nature of Italian despotism. The tyrants, as we have already seen, established themselves as captains of the people, vicars of the empire, vicars for the church, leaders of the Guelph and Ghibelline parties. They were accepted by a population eager for repose, who had merged old class distinctions in the conflicts of preceding centuries. They resided in large measure on the favour of the multitude, and pursued a policy of sacrificing to their interests the nobles. It was natural that these self-made princes should seek to secure the peace which they had promised in their cities, by freeing the people from military service and disarming the aristocracy. As their tenure of power grew firmer, they advanced dynastic claims, assumed titles, and took the style of petty sovereigns. Their government became paternal; and, though there was no limit to their cruelty when stung by terror, they used the purse rather than the sword, bribery at home and treasonable intrigue abroad in preference to coercive measures or open war. Thus was elaborated the type of despot which attained completeness in Gian Galeazzo Visconti and Lorenzo de' Medici. No longer a tyrant of Ezzelino's stamp, he reigned by intelligence and terrorism masked beneath a smile. He substituted cunning and corruption for violence. The lesser people tolerated him because he extended the power of their city and made it beautiful with public buildings.

Riches were accumulated by the despots, and it was convenient to support them. The nobles, turned into courtiers, adventurers, diplomats and men of affairs, ended by preferring his authority to the alternative of democratic institutions. A lethargy of well-being, broken only by the pinch of taxation for war-costs, or by outbursts of frantic ferocity and lust in the less calculating tyrants, descended on the population of cities which had boasted of their freedom. Only Florence and Venice, at the close of the period upon which we are now entering, maintained their republican independence. And Venice was ruled by a close oligarchy; Florence was passing from the hands of her oligarchs into the power of the Medicean merchants.

Between the year 1305, when Clement V. settled at Avignon, and the year 1447, when Nicholas V. re-established the papacy upon a solid basis at Rome, the Italians approximated more nearly to self-government than at any other epoch of their history. The conditions which have been described, of despotism, mercenary warfare and bourgeois prosperity, determined the character of this epoch, which was also the period when the great achievements of the Renaissance were prepared. At the end of this century and a half, five principal powers divided the peninsula; and their confederated action during the next forty-five years (1447-1492) secured for Italy a season of peace and brilliant prosperity. These five powers were the kingdom of Naples, the duchy of Milan, the republic of Florence, the republic of Venice and the papacy. The subsequent events of Italian history will be rendered most intelligible if at this point we trace the development of these five constituents of Italian greatness separately.

When Robert of Anjou died in 1343, he was succeeded by his grand-daughter Joan, the childless wife of four successive husbands, Andrew of Hungary, Louis of Taranto, James of Aragon and Otto of Brunswick. Charles of Durazzo, the last male scion of the Angevins, in Lower Italy, murdered Joan in 1352, and held the kingdom for five years. Dying in 1358, he transmitted Naples to his son Ladislaus, who had no children, and was followed in 1414 by his sister Joan II. She too, though twice married, died without issue, having at one time adopted Louis III. of Provence and his brother René, at another Alfonso V. of Aragon, who inherited the crown of Sicily. After her death in February 1435 the kingdom was fought for between René of Anjou and Alfonso, summoned the Magnanimous. René found supporters among the Italian princes, especially the Milanese Visconti, who helped him to assert his claims with arms. During the war of succession which ensued, Alfonso was taken prisoner by the Genoese fleet in August 1435, and was sent a prisoner to Filippo Maria at Milan. Here he pleaded his own cause so powerfully, and proved so incontestably the advantage which might ensue to the Visconti from his alliance, if he held the regno, that he obtained his release and recognition as king. From the end of the year 1435
Alfonso reigned alone and undisturbed in Lower Italy, combining for the first time since the year 1282 the crowns of Sicily and Naples. The former he held by inheritance, together with that of Aragon. The latter he considered to be his by conquest. Therefore, when he died in 1458, he bequeathed Naples to his natural son Ferdinand, while Sicily and Aragon passed together to his brother John, and so on to Ferdinand the Catholic. The twenty-three years of Alfonso’s reign were the most prosperous and splendid period of South Italian history. He became an Italian in taste and sympathy, entering with enthusiasm into the humanistic ardour of the earlier Renaissance, encouraging men of letters at his court, administering his kingdom on the principles of an enlightened despotism, and lending his authority to establish that equilibrium in the peninsula upon which the politicians of his age believed, not without reason, that Italian independence might be secured.

Duchy of Milan.

The last member of the Visconti family of whom we had occasion to speak was Azzo, who bought the city in 1328 from Louis of Bavaria. His uncle Lucchino succeeded, but was murdered in 1340 by a wife against whose life he had been plotting. Lucchino’s brother John, archbishop of Milan, now assumed the lordship of the city, and extended the power of the Visconti over Genoa and the whole of north Italy, with the exception of Piedmont, Verona, Mantua, Ferrara and Venice. The greatness of the family dates from the reign of this masterful prelate. He died in 1354, and his heritage was divided between three members of his house, Matteo, Bernabò and Galeazzo. In the next year Matteo, being judged incompetent to rule, was assassinated by order of his brothers, who made an equal partition of their subject cities—Bernabò residing in Milan, Galeazzo in Pavia. Galeazzo was the wealthiest and most magnificent Italian of his epoch. He married his daughter Violante to our duke of Clarence, and his son Gian Galeazzo to a daughter of King John of France. When he died in 1378, this son resolved to reunite the domains of the Visconti; and, with this object in view, he plotted and executed the murder of his uncle Bernabò. Gian Galeazzo thus became by one stroke the most formidable of Italian despots. Immured in his castle at Pavia, accumulating wealth by systematic taxation and methodical economy, he organized the mercenary troops who eagerly took service under so good a paymaster; and, by directing their operations from his cabinet, he threatened the whole of Italy with conquest. The last scions of the Delta Scala family still reigned in Verona, the last Carrarese in Padua; the Esteens were powerful in Ferrara, the Gonzaghi in Mantua. Gian Galeazzo, partly by force and partly by intrigue, discredited these minor despots, pushed his dominion to the very verge of Venice, and, having subjected Lombardy to his sway, proceeded to attack Tuscany. Pisa and Perugia were threatened with extinction, and Florence dreaded the advance of the Visconti arms, when the plague suddenly cut short his career of treachery and conquest in the year 1402. Seven years before his death Gian Galeazzo bought the title of duke of Milan and count of Pavia from the emperor Wenceslaus, and there is no doubt that he was aiming at the imperial title. But no sooner was Gian Galeazzo dead than the essential weakness of an artificial state, built up by cunning and perfidious policy, with the aid of bought troops, dignified by no dynastic title, and consolidated by no sense of loyalty, became apparent. Gian Galeazzo’s duchy was a masterpiece of mechanical contrivance, the creation of a scheming intellect and lawless will. When the mind which had planned it was withdrawn, it fell to pieces, and the very hands which had been used to build it helped to scatter its fragments. The Visconti’s own generals, Facino Cane, Pandolfo Malatesta, Jacopo dal Verme, Gabrino Fondulo, Ottobon Terzo, seized upon the tyranny of several Lombard cities. In others the petty tyrants whom the Visconti had uprooted reappeared. The Esteens recovered their grasp upon Ferrara, and the Gonzaghi upon Mantua. Venice strengthened herself between the Adriatic and the Alps. Florence reasserted her Tuscan hegemony. Other communes which still preserved the shadow of independence, like Perugia and Bologna, began once more to dream of republican freedom under their own leading families. Meanwhile Gian Galeazzo had left two sons, Giovanni Maria and Filippo Maria. Giovanni, a monster of cruelty and lust, was assassinated by some Milanese nobles in 1412; and now Filippo set about rebuilding his father’s duchy. Herein he was aided by the troops of Facino Cane, who, dying opportunely at this period, left considerable wealth, a well-organized band of mercenaries, and a widow, Beatrice di Tenda. Filippo married and then beheaded Beatrice after a mock trial for adultery, having used her money and her influence in uniting several subject cities to the crown of Milan. He subsequently spent a long, suspicious, secret and incomprehensible career in the attempt to piece together Gian Galeazzo’s Lombard state, and to carry out his schemes of Italian conquest. In this endeavour he met with vigorous opponents. Venice and Florence, strong in the strength of their resentful oligarchies, offered a determined resistance; nor was Filippo equal in ability to his father. His infernal cunning often defeated its own aims, checkmating him at the point of achievement by suggestions of duplicity or terror. In the course of Filippo’s wars with Florence and Venice, the greatest generals of this age were formed—Francesco Sforz, who was beheaded between the columns at Venice in 1432; Niccolò Piccinino, who died at Milan in 1444; and Francesco Sforza, who survived to seize his master’s heritage in 1450. Son ofAttendolo Sforza, this Francesco received the hand of Filippo’s natural daughter, Bianca, as a reward for past service and a pledge of future support. When the Visconti dynasty ended by the duke’s death in 1447, he pretended to espouse the cause of the Milanese republic, which was then re-established; but he played his cards so subtly as to make himself, by the help of Cosimo de’ Medici in Florence, duke de facto if not de jure. Francesco Sforza was the only condottiero among many aspiring to be tyrants who planted themselves firmly on a throne of first-rate importance. Once seated in the duchy of Milan, he displayed rare qualities as a ruler; for he not only entered into the spirit of the age, which required humanity and culture from a despot, but he also knew how to curb his desire for territory. The conception of confederated Italy found in him a vigorous supporter. Thus the limitation of the Milanese duchy under Filippo Maria Visconti, and its consolidation under Francesco Sforza, were equally effectual in preparing the balance of power to which Italian politics now tended.

This balance could not have been established without the concurrent aid of Florence. After the expulsion of the duke of Athens in 1343, and the great plague of 1348, the Florentine proletariat rose up against the merchant princes. This insurrection of the artisans, in a republic which had been remodelled upon economical principles by Giano della Bella’s constitution of 1292, reached a climax in 1378, when the Ciompi rebellion placed the city for a few years in the hands of the Lesser Arts. The revolution was but temporary, and was rather a symptom of democratic tendencies in the state than the sign of any capacity for government on the part of the working classes. The necessities of war and foreign affairs soon placed Florence in the power of an oligarchy headed by the great Albizzi family. They fought the battle of the Piave, and the Florentines, cut off from Venice, were soon forced to yield. The Albizzi, who had greatly extended the Florentine domain over the Tuscan cities. During their season of ascendancy Pisa was enslaved, and Florence gained the access to the sea. But throughout this period a powerful opposition was gathering strength. It was led by the Medici, who sided with the common people, and increased their political importance by the accumulation and wise employment of vast commercial wealth. In 1433 the Albizzi and the Medici came to open strife. Cosimo de’ Medici, the chief of the opposition, was exiled to Venice. In the next year he returned, assumed the presidency of the democratic party, and by a system of corruption and popularity-hunting, combined with the patronage of arts and letters, established himself as the real but unacknowledged dictator of the commons. Cosimo abandoned the policy of his predecessors. Instead of opposing Francesco Sforza in Milan, he lent him his prestige and influence, foreseeing that the dynastic future of his own family and the pacification of Italy might be secured by a balance of power in
which Florence should rank on equal terms with Milan and Naples.

The republic of Venice differed essentially from any other state in Italy; and her history was so separate that, up to this point, it would have been needless to interrupt the narrative by tracing it. Venice, however, in the 14th century took her place at last as an Italian power on an equality at least with the very greatest. The constitution of the commonwealth had slowly matured itself through a series of revolutions, which confirmed and defined a type of singular stability. During the earlier days of the republic the doge had been a prince elected by the people, and answerable only to the popular assemblies. In 1322 he was obliged to act in concert with a senate, called pregadi; and in 1327 the grand council, which became the real sovereign of the state, was formed. The several steps whereby the members of the grand council succeeded in eliminating the people from a share in the government, and reducing the doge to the position of their ornamental representative, cannot here be described. It must suffice to say that these changes culminated in 1327, when an act was passed for closing the grand council, or in other words for confining it to a fixed number of privileged families, in whom the government was henceforth vested by hereditary right. This ratification of the oligarchical principle, together with the establishment in 1311 of the Council of Ten, completed that famous constitution which endured till the extinction of the republic in 1797. Meanwhile, throughout the middle ages, it had been the policy of Venice to refrain from conquests on the Italian mainland, and to confine her energies to commerce in the East. The first entry of any moment made by the Venetians into strictly Italian affairs was in 1336, when the republics of Florence and St Mark allied themselves against Mastino della Scala, and the latter took possession of Treviso. After this, for thirty years, between 1352 and 1381, Venice and Genoa contested the supremacy of the Mediterranean. Pisa’s maritime power having been extinguished in the battle of Meloria (1284), the two surviving republics had no rivals. They fought their duel out upon the Bosporus, off Sardinia, and in the Morea, with various success. From the first great encounter, in 1355, Venice retired well-nigh exhausted, and Genoa was so crippled that she placed herself under the protection of the Visconti. The second and decisive battle was fought upon the Adriatic. The Genoese fleet under Luciano Doria defeated the Venetians off Pola in 1379, and sailed without opposition to Chioggia, which was stormed and taken. Thus the Venetians found themselves blockaded in their own lagoons. Meanwhile a fleet was raised for their relief by Carlo Zeno in the Levant, and the admiral Vittore Pisani, who had been imprisoned after the defeat at Pola, was released to lead their forlorn hope from the city side. The Genoese in their turn were now blockaded in Chioggia, and forced by famine to surrender. The losses of men and money which the war of Chioggia, as it was called, entailed, though they did not immediately depress the spirit of the Venetian republic, signed her naval ruin. During this second struggle to the death with Genoa, the Venetians had been involved with the Carraresi of Padua and the Scaligers of Verona. In 1406, after the extinction of these princely houses they added Verona, Vicenza and Padua to the territories they claimed on terra firma. Their career of conquest, and their new policy of forming Italian alliances and entering into the management of Italian affairs were confirmed by the long dogeship of Francesco Foscari (1423–1457), who must rank with Alfonso, Cosimo de’ Medici, Francesco Sforza and Nicholas V., as a joint-founder of confederated Italy. When Constantine fell in 1453, the old ties between Venice and the Eastern empire were broken, and she now entered on a wholly new phase of her history. Ranking as one of the five Italian powers, she was also destined to defend Western Christendom against the encroachments of the Turk in Europe. (See Venice: History.)

By their settlement in Avignon, the popes relinquished their protectory of Italian liberties, and lost their position as Italian potentates. Rienzi’s revolution in Rome (1347–1354), and his establishment of a republic upon a fantastic basis, half classical, half feudal, proved the temper of the times; while the rise of dynastic families in the cities of the church, claiming the title of papal vicars, but acting in their own interests, weakened the authority of the Holy See. The predatory expeditions of Bertrand du Poi et and Robert of Geneva were as ineffective as the descents of the emperors; and, though the cardinal Albornoz conquered Romagna and the March in 1364, the legates who resided in those districts were not long able to hold them against their despots. At last Gregory XI. returned to Rome; and Urban VI., elected in 1378, put a final end to the Avignonian exile. Still the Great Schism, which now distracted Western Christendom, so enfeebled the papacy, and kept the Roman pontiffs so engaged in ecclesiastical disputes, that they had neither power nor leisure to occupy themselves seriously with their temporal affairs. The threatening presence of the two princely houses of Orsini and Colonna, alike dangerous as friends or foes, rendered Rome an unsafe residence. Even when the schism was nominally terminated in 1415 by the council of Constance, the next two popes held but a precarious grasp upon their Italian domains. Martin V. (1417–1421) resided principally at Florence. Eugenius IV. (1431–1447) followed his example. And what Martin managed to regain Eugenius lost. At the same time, the change which had now come over Italian politics, the desire on all sides for a settlement, and the growing conviction that a federation was necessary, proved advantageous to the popes as sovereigns. They gradually entered into the spirit of their age, assumed the style of despots and made use of the humanistic movement, then at its height, to place themselves in a new relation to Italy. The election of Nicholas V. in 1447 determined this revolution in the papacy, and opened a period of temporal splendour, which ended with the establishment of the popes as sovereigns. Thomas of Sarzana was a distinguished humanist. Humbly born, he had been tutor in the house of the Albizzi, and afterwards librarian of the Medici at Florence, where he imbued the politics together with the culture of the Renaissance. Soon after assuming the tiara, he found himself without a rival in the church; for the schism ended by Felix V.’s resignation in 1440. Nicholas fixed his residence in Rome, which he began to rebuild and to fortify, determining to render the Eternal City once more a capital worthy of its high place in Europe. The Romans were flattered; and, though his reign was disturbed by republican conspiracy, Nicholas V. was able before his death in 1455 to secure the modern status of the pontiff as a splendid patron and a wealthy temporal potentate.

Italy was now for a brief space independent. The humanistic movement had created a common culture, a common language and sense of common nationality. The five great powers, with their satellites—dukes of Savoy and Urbino, marquesses of Ferrara and Mantua, republics of Bologna, Perugia, Siena—were constituted. All political institutions tended toward despotism. The Medici became yearly more indispensable to Florence, the Bentivogli more autocratic in Bologna, the Baglioni in Perugia; and even Siena was ruled by the Medici. But this despoticism was of a mild type. The princes of the Italian states, though not without enthusiasm of the nation for art, learning, literature and science; they studied how to mask their tyranny with arts agreeable to the multitude. When Italy had reached this point, Constantinople was taken by the Turks. On all sides it was felt that the Italian alliance must be tightened; and one of the last, best acts of Nicholas V.’s pontificate was the appeal in 1453 to the five great powers in federation. As regards their common opposition to the Turk, this appeal led to nothing; but it marked the growth of a new Italian consciousness.

Between 1453 and 1492 Italy continued to be prosperous and tranquil. Nearly all wars during this period were undertaken either to check the growing power of Venice or to further the ambition of the papacy. Having become despots, the popes sought to establish their relatives in principalities. The word nepotism acquired new significance in the reigns of Sixtus IV. and Innocent VIII. Though the country was convulsed by no great struggle, these forty years witnessed a truly appalling
increase of political crime. To be a prince was tantamount to being the mark of secret conspiracy and assassination. Among the most noteworthy examples of such attempts may be mentioned the revolt of the barons against Ferdinand I. of Naples (1464), the murder of Galeazzo Maria Sforza at Milan (1476) and the plot of the Pazzi to destroy the Medici (1478). After Cosimo de' Medici's death in 1464, the presidency of the Florentine republic passed to his son Piero, who left it in 1469 to his sons Lorenzo and Giuliano. These youths assumed the style of princes, and it was against their lives that the Pazzi, with the sanction of Sixtus IV., aimed their blow. Giuliano was murdered, Lorenzo escaped, to tighten his grasp upon the city, which now loved him and was proud of him. During the following fourteen years of his brilliant career he made himself absolute master of Florence, and so modified her institutions that the Medici were henceforth necessary to the state. Apprehending the importance of Italian federation, Lorenzo, by his personal tact and prudent leadership of the republic, secured peace and a common intelligence between the five powers. His own family was fortified by the marriage of his daughter to a son of Innocent VIII., which procured his son Giovanni's elevation to the cardinalate, and that of his niece to the French king, thus making the Florentine popes and the future dependence of Florence upon Rome.

VI. Age of Invasions.—The year 1492 opened a new age for Italy. In this year Lorenzo died, and was succeeded by his son, the vain and weak Piero; France passed beneath the personal control of the inexperienced Charles VIII.; the fall of Granada freed Spain from her embarrassments; Columbus discovered America, destroying the commercial supremacy of Venice; last, but not least, Rodrigo Borgia assumed the tiara with the famous title of Alexander VI. In this year the short-lived federation of the five powers was shaken, and Italy was once more drawn into the vortex of European affairs. The events which led to this disaster may be briefly told. After Galeazzo Maria's assassination, his crown passed to a boy, Gian Galeazzo, who was in due course married to a grand-daughter of Ferdinand I. of Naples. But the government of Milan remained in the hands of this youth's uncle, Lodovico, surnamed Il Moro. Lodovico resolved to become duke of Milan. The king of Naples was his opponent, he had to suspect that Piero de' Medici might abandon his alliance. Feeling himself alone, with no right to the title he was bent on seizing, he had recourse to Charles VIII. of France, whom he urged to make good his claim to the kingdom of Naples. This claim, it may be said in passing, rested on the will of King René of Anjou. After some hesitation, Charles agreed to invade Italy. He crossed the Alps in 1495, passed through Lombardy, entered Tuscany, freed Pisa from the yoke of Florence, witnessed the expulsion of the Medici, marched to Naples and was crowned there—all this without striking a blow. Meanwhile Lodovico procured his nephew's death, and raised a league against the French in Lombardy. Charles hurried back from Naples, and narrowly escaped destruction at Forlorn in the passes of the Apennines. He made good his retreat, however, and returned to France in 1495. Little remained to him of his light acquisitions; but he had convulsed Italy by this invasion, destroyed her equilibrium, exposed her military weakness and political disunion, and revealed her wealth to greedy and more powerful nations.

The princes of the house of Aragon, now represented by Frederick, a son of Ferdinand I., returned to Naples. Florence made herself a republic, adopting a form of constitution analogous to that of Venice. At this crisis she was ruled by the monk Girolamo Savonarola, who inspired the people with a thirst for freedom, preached the necessity of reformation, and placed himself in direct antagonism to Rome. After a short but eventful career, the influence of which was long effective, he lost his hold upon the citizens. Alexander VI. procured a mock trial, and his enemies burned him upon the Piazza in 1498. In this year Louis XII. succeeded Charles VIII. upon the throne of France. As duke of Orleans he had certain claims to Milan through his grandmother Valentina, daughter of Gian Galeazzo, the first duke. They were not valid, for the investiture of the duchy had been granted only to male heirs. But they served as a sufficient pretext, and in 1499 Louis entered and subdued the Milanese. Lodovico escaped to Germany, returned the next year, was betrayed by his Swiss mercenaries and sent to die at Loches in France. In 1500 Louis made the blunder of calling Ferdinand the Catholic to help him in the conquest of Naples. By a treaty signed at Granada, the French and Spanish kings were to divide the spoil. The conquest was easy; but, when it came to a partition, Ferdinand played his ally false. He made himself supreme over the Two Sicilies, which he now reunited under a single crown. Three years later, unlessoned by this experience, Louis signed the treaty of Blois (1504), whereby he invited the emperor Maximilian to aid him in the subjugation of Venice. No policy could have been less far-sighted; for Charles V., joint heir to Austria, Burgundy, Castile and Aragon, the future overwhelming rival of France, was already born.

The stage was now prepared, and all the actors who were destined to accomplish the ruin of Italy trod it with their armies. Spain, France, Germany, with their Swiss auxiliaries, had been summoned upon various pretences to partake in the fantastic enterprise. Then, too late, patriots like Machiavelli perceived the suicidal self-indulgence of the past, which, by substituting mercenary troops for national militiamen, left the Italians at the absolute discretion of their neighbours. Whatever parts the Italians themselves played in the succeeding quarter of a century, the game was in the hands of French, Spanish and German invaders. Meanwhile, no scheme for combination against common foes arose in the peninsula. Each petty potentate strove for his own private advantage in the confusion; and at this epoch the chief gains accrued to the papacy. Aided by his terrible son, Cesare Borgia, Alexander VI. chastised the Roman nobles, subdued Romagna and the March, threatened Tuscany, and seemed to be upon the point of creating a Central Italian state in favour of his progeny, when he died suddenly in 1503. His conquests reverted to the Holy See. Julius II., his bitterest enemy and powerful successor, continued Alexander's policy, but no longer in the interest of his own relatives. It became the nobler ambition of Julius to aggrandize the church, and to reassert itself in the Italian peninsula. Thereupon, Julius II., prudent as Machiavelli had been, turned his victorious arms against Ferrara, and curbed the tyranny of the Baglioni in Perugia. Julius II. played a perilous game; but the stakes were high, and he fancied himself strong enough to guide the tempest he evoked. Quarrelling with the Venetians in 1508, he combined the forces of all Europe by the league of Cambrai against them; and, when he had succeeded in his first purpose of humbling them even to the dust, he turned round in 1510, uttered his famous resolve to expel the barbarians from Italy, and pitied the Spaniards against the French. It was with the Swiss that he hoped to effect this revolution; but the Swiss, now interposing for the first time as principals in Italian affairs, were incapable of more than adding to the already maddening distractions of the people. Firmed for mercenary warfare, they proved a perilous instrument in the hands of those who used them, and were hardly less injurious to their friends than to their foes. In 1512 the battle of Ravenna between the French troops and the allies of Julius—Spaniards, Venetians and Swiss—was fought. Guston Julius—who foresaw a doubtful victory dearly with his death—and the allies, though beaten on the banks of the Ronco, immediately afterwards expelled the French from Lombardy. Yet Julius II. had failed, as might have been foreseen. He only exchanged one set of foreign masters for another, and taught a new barbarian race how pleasant were the plains of Italy. As a consequence of the battle of Ravenna, the Medici returned in 1512 to Florence.

When Leo X. was elected in 1513, Rome and Florence rejoiced; but Italy had no reposé. Louis XII. had lost the game, and the Spaniards were triumphant. But new actors appeared upon the scene, and the same old struggle was resumed with fiercer energy. By the victory of Marignano in 1515 Francis I., having now succeeded to the throne of France, regained the Milanese,
and broke the power of the Swiss, who held it for Massimiliano Sforza, the titular duke. Leo for a while relied on Francis; for the vast power of Charles V., who succeeded to the empire in 1530, as in 1516 he had succeeded to the crowns of Spain and Lower Italy, threatened the whole of Europe. It was Leo’s nature, however, to be inconstant. In 1521 he changed sides, allied himself to Charles, and died after hearing that the imperial troops had again expelled the French from Milan. During the next four years the Franco-Spanish war dragged on in Lombardy until the decisive battle of Pavia in 1525, when Francis was taken prisoner, and Italy lay open to the Spanish armies. Meanwhile Leo X. had been followed by Adrian VI., and Adrian by Clement VII., of the house of Medici, who had long ruled Florence. In the reign of this pope Francis was released from his prison in Madrid (1526), and Clement hoped that he might still be in the Italian interest as a counterpoise to Charles. It is impossible in this place to follow the tangled intrigues of that period. The year 1527 was signalized by the famous sack of Rome. An army of mixed German and Spanish troops, pretending to act for the emperor, but which may rather be regarded as a vast marauding party, entered Italy under their leader Frundsberg. After his death, the Constable de Bourbon took command of them; they marched slowly down, aided by the marquis of Ferrara, and unopposed by the duke of Urbino, reached Rome, and took it by assault. The constable was killed in the first onslaught; Clement was imprisoned in the castle of St. Angelo; Rome was abandoned to the rage of 30,000 ruffians. As an immediate result of this catastrophe, Florence shook off the Medici, and established a republic. But Clement, having made peace with the emperor, turned the remnants of the army which had sacked Rome against his native city. After a desperate resistance, Florence fell in 1530. Alessandro de’ Medici was placed there with the title of duke of Città di Penna; and, on his murder in 1537, Cosimo de’ Medici, 1st Duke of Florence, restored the old Medici constitution. In 1535 he was made duke. Acting as lieutenant for the Spaniards, he subsequently (1555) subdued Siena, and bequeathed to his descendants the grand-duchy of Tuscany.

VII. Spanish-Austrian Ascendancy. — It was high time, after the sack of Rome in 1527, that Charles V. should undertake Italian affairs. The country was exposed to anarchy, of which this had been the last and most disgraceful example. The Turks were threatening western Europe, and Luther was inflaming Germany. By the treaty of Barcelona in 1520 the pope and emperor made terms. By that of Cambray in the same year France relinquished Italy to Spain. Charles then entered the port of Genoa, and on the 5th of November met Clement VII. at Bologna. He there received the imperial crown, and summoned the Italian princes for a settlement of all disputed claims. Francesco Sforza, the last and childless heir of the imperial house, was left in Milan till his death, which happened in 1535. The republic of Venice was respected in its liberties and Lombard territories. The Este family received a confirmation of their duchy of Modena and Reggio, and were invested in their fief of Ferrara by the pope. The marquessate of Mantua was made a duchy; and Florence was secured, as we have seen, to the Medici. The great gainer by this settlement was the papacy, which held the most substantial Italian province, together with a prestige that raised it far above all rivalry. The rest of Italy, however parcellled, henceforth became a dependence upon Spain. Charles V., it must be remembered, achieved his conquest and confirmed his authority far less as emperor than as the heir of Castile and Aragon. A Spanish viceroy in Milan and another in Naples, supported by Rome and by the minor princes who followed the policy dictated to them from Madrid, were sufficient to preserve the whole peninsula in a state of somnolent inglorious servitude.

From 1530 to 1796, that is, for a period of nearly three centuries, the Italians had no history of their own. Their annals are filled with records of dynastic changes and redistributions of territory, consequent upon treaties signed by foreign powers, in the settlement of quarrels which no wise concerned the people. But these wars were fought for the most part by alien armies; the points at issue were decided beyond the Alps; the gains accrued to royal families whose names were unpronounceable by southern tongues. The affairs of Europe during the years when Habsburg and Bourbon fought their domestic battles with the blood of noble races may teach grave lessons to all thoughtful men of our days, but none bitterer, none fraught with more insulting recollections, than to the Italian people, who were haggled over like dumb driven cattle in the mart of chaffering kings. We cannot wholly acquit the Italians of their share of blame. When they might have won national independence, after their warfare with the Swabian emperors, they let the golden opportunity slip. Pampered with commercial prosperity, eaten to the core with inter-urban rivalries, they submitted to despoits, renounced the use of arms, and offered themselves in the hour of need, defenceless and disinclined to the shock of puissant nations. That they had created modern civilization for Europe availed them nothing. Italy, intellectually first among the peoples, was now politically and practically last; and nothing to her historian is more heartrending than to watch the gradual extinction of her spirit in this age of slavery.

In 1534 Alessandro Farnese, who owed his elevation to his sister Giulia, one of Alexander VI.’s mistresses, took the tiara with the title of Paul III. It was his ambition to create a duchy for his family; and with this object he gave Parma and Piacenza to his son Pier Luigi. After much wrangling between the French and Spanish parties, the duchy was confirmed in 1586 to Ottaviano Farnese and his son Alessandro, better known as Philip II.’s general, the prince of Parma. Alessandro’s descendants reigned in Parma and Piacenza till the year 1731. Paul III.’s pontificate was further marked by important changes in the church, all of which verged on the spiritual autocracy of Rome. In 1540 the pope approved of Loyola’s foundation, and secured the powerful militia of the Jesuit order. The Inquisition was established with almost unlimited powers in Italy, and the press was placed under its jurisdiction. Thus free thought received a check, by which not only ecclesiastical but political tyrants knew how to profit. Henceforth it was impossible to publish or to utter a word which might offend the despots of church or state; and the Italians had to amuse their leisure with the polite trills of academicians. In 1545 a council was opened at Trent for the reformation of church discipline and the promulgation of orthodox doctrine. The decrees of this council defined Roman Catholicism against the Reformation; and, while failing to regenerate morality, they enforced a hypocritical observance of public decency. Italy to outer view put forth blossoms of hectic and hysterical piety, though at the core her clergy and her aristocracy were more corrupt than ever.

In 1556 Philip II., by the abdication of his father Charles V., became king of Spain. He already wore the crown of the Two Sicilies, and ruled the duchy of Milan. In the next year Ferdinand, brother of Charles, was elected emperor. The French, meanwhile, had not entirely abandoned their claims on Italy. Gian Pietro Caraffa, who was made pope in 1555 with the name of Paul IV., endeavoured to revive the ancient papal policy of leaning upon France. He encouraged the duke of Guise to undertake the conquest of Naples, as Charles of Anjou had been summoned by his predecessors. But such schemes were now obsolete and anachronistic. They led to a languid lingering Italian campaign, which was settled far beyond the Alps by Philip’s victories over the French at St. Quentin and Gravelines. The peace of Cateau Cambresis, signed in 1559, left the Spanish monarch undisputed lord of Italy. Of free commonwealths there now survived only Venice, which, together with Spain, achieved for Europe the victory of Lepanto in 1571; Genoa, which, after the ineffectual Fieschi revolution in 1547, abode beneath the rule of the great Doria family, and held a feeble sway in Corsica; and the two insignificant republics of Lucca and San Marino.
The future hope of Italy, however, was growing in a remote and hitherto neglected corner. Emmanuel Philibert, duke of Savoy, represented the oldest and not the least illustrious reigning house in Europe, and his descendants were destined to achieve for Italy the independence which no other power or prince had given her since the fall of ancient Rome. (See Savoy, House of.)

When Emmanuel Philibert succeeded to his father Charles III. in 1553, he was a duke without a duchy. But the princes of the house of Savoy were a race of warriors; and what Emmanuel Philibert lost as sovereign he regained as captain of adventure in the service of his cousin Philip II. The treaty of Cateau Cambresis in 1559, and the evacuation of the Piedmontese cities held by French and Spanish troops in 1574, restored his state. By removing the capital from Chambéry to Turin, he completed the transformation of the dukes of Savoy from Burgundian into Italian sovereigns. They still owned Savoy beyond the Alps, the principalities of Bressan and the maritime province of Nice.

Emmanuel Philibert was succeeded by his son Charles Emmanuel I., who married Catherine, a daughter of Philip II. He seized the first opportunity of annexing Saluzzo, which had been lost to Savoy in the last two reigns, and renewed the disastrous policy of his grandfather Charles III. by invading Geneva and threatening Provence. Henry IV. of France forced him in 1601 to relinquish Bresse and his Burgundian possessions. In return he was allowed to keep Saluzzo. All hopes of conquest on the transalpine side were now quenched; but the keys of Italy had been given to the dukes of Savoy; and their attention was still further concentrated upon Lombard conquests. Charles Emmanuel now attempted the acquisition of Montferrat, which was soon to become vacant by the death of Francesco Gonzaga, who held it together with Mantua. In order to secure this territory, he went to war with Philip III. of Spain, and allied himself with Venice and the Grisons to expel the Spaniards from the Valtelline. When the main line of the Gonzaga family expired in 1627, Charles, duke of Nevers, claimed Mantua and Montferrat in right of his wife, the only daughter of the last duke. Charles Emmanuel was now checkmated by France, as he had formerly been by Spain. The total gains of all his strenuous endeavours amounted to the acquisition of a few places on the borders of Montferrat.

Not only the Gonzagas, but several other ancient ducal families, died out about the date which we have reached. The legitimate line of the Estensi ended in 1597 by the death of Alfonso II., the last duke of Ferrara. He left his domains to a natural relative, Cesare d'Este, who would in earlier days have inherited without dispute, for bastardy had been no bar on more than one occasion in the Este pedigree. Urban VIII., however, put in a claim to Ferrara, which, it will be remembered, had been recognized a papal fief in 1590. Cesare d'Este had content himself with Modena and Reggio, where his descendants reigned as dukes till 1794. Under the same pontiff, the Holy See absorbed the duchy of Urbino on the death of Francesco Maria II., the last representative of Montefeltro and della Rovere. The popes were now masters of a fine and compact territory, embracing no considerable portion of Countess Matilda's legacy, in addition to Pippin's donation, and the patrimony of St. Peter. Meanwhile Spanish fanaticism, the suppression of the Huguenots in France and the Catholic policy of Austria combined to strengthen their authority as pontiffs. Urban's predecessor, Paul V., advanced so far as to extend his spiritual jurisdiction over Venice, which, up to the date of his election (1605), had resisted all encroachments of the Holy See. Venice offered the single instance in Italy of a national church. The republic managed the tithes, and the clergy acknowledged no chief above their own patriarch. Paul V. now forced the Venetians to admit his ecclesiastical supremacy; but they refused to readmit the Jesuits, who had been expelled in 1606. This, if we do not count the proclamation of James I. of England (1604), was the earliest instance of the order's banishment from a state where it had proved disloyal to the commonwealth.

Venice rapidly declined throughout the 17th century. The loss of trade consequent upon the closing of Egypt and the Levant, together with the discovery of America and the sea-route to the Indies, had dried up her chief source of wealth. Prolonged warfare with the Ottomans, who forced her to abandon Candia in 1669, as they had robbed her of Cyprus in 1570, still further crippled her resources. Yet she kept the Adriatic free of pirates, notably by suppressing the sea-robbers called Usocchi (1601–1617), maintained herself in the Ionian Islands, and in 1684 added more to the series of victorious episodes which render her annals so romantic. In that year Francesco Morosini, upon whose tomb we still may read the title Peloponnesiacus, wrested the whole of the Morea from the Turks. But after his death in 1715 the republic relaxed her hold upon his conquests. The Venetian nobles abandoned themselves to indolence and vice. Many of them fell into the slough of pauperism, and were saved from starvation by public doles. Though the sly anxious still made brave show upon occasions of parade, it was clear that the state was rotten to the core, and sinking into the decrepitude of dotage.

The Spanish monarchy at the same epoch dwindled with apparently less reason. Philip's Austrian successors reduced it to the rank of a secondary European power. This decline of vigour was felt, with the customary effects of discord and bad government, in Lower Italy. The revolt of Masaniello in Naples (1647), followed by rebellions at Palermo and Messina, which placed Sicily for a while in the hands of Louis XIV. (1676–1678) were symptoms of progressive anarchy. The population, ground down by posthumous taxes, ill-used as only the subjects of Spaniards, Turks or Bourbons are handled, rose in blind exasperation against their oppressors. It is impossible to attach political importance to these revolutions; nor did they bring the people any appreciable good. The destinies of Italy were determined by the great statesmen of Europe. A Bourbon at Versailles, a Habsburg at Vienna, or a thick-lipped Lorrainer, with a stroke of his pen, wrote off province against province, regarding not the populations who had bled for him or thrown themselves upon his mercy.

This inglorious and passive chapter of Italian history is continued to the date of the French Revolution with the records of three dynastic wars, the war of the Spanish succession, the war of the Polish succession, the war of the Austrian succession, followed by three European treaties, which brought them respectively to diplomatic terminations. Italy, handled and rehandled, settled and resettled, upon each of these occasions, changed masters without caring or knowing what befell the principals in any one of the disputes. Humiliating to human nature in general as are the annals of the 18th-century campaigns in Europe, there is no point of view from which they appear in a light so tragic-comic as from that afforded by Italian history. The system of setting nations by the ears with the view of settling the quarrels of a few reigning houses was reduced to absurdity when the people, as in these cases, came to be partitioned and exchanged without the assertion or negation of a single principle affecting their interests or rousing their emotions.

In 1700 Charles II. died, and with him ended the Austrian family in Spain. Louis XIV. claimed the throne for Philip, duke of Anjou. Charles, archduke of Austria, opposed him. The dispute was fought out in Flanders; but Lombardy felt the shock, as usual, of the French and Austrian dynasties. The French armies were more than once defeated by Prince Eugene of Savoy, who drove them out of Italy in 1707. Therefore, in the peace of Utrecht (1713), the services of the house of Savoy had to be duly recognized. Victor Amadeus II. received Sicily with the title of duke. Montferrat and the Savoyard claim on the battlefield of Turin was also admitted, and his state was recognized as independent. Charles of Austria, now emperor, took Milan, Mantua, Naples and Sardinia for his portion of the Italian spoil. Philip founded the Bourbon line of Spanish kings, renouncing in Italy all that his Habsburg predecessors had gained. Discontented with this diminution
of the Spanish heritage, Philip V. married Elisabetta Farnese, heiress to the last duke of Parma, in 1714. He hoped to secure this duchy for his son, Don Carlos; and Elisabetta further brought with her a claim to the grand-duchy of Tuscany, which would soon become vacant by the death of Gian Gastone de' Medici. After this marriage Philip broke the peace of Europe by invading Sardinia. The Quadruple Alliance was formed, and the new king of Sicily was punished for his supposed adherence to Philip V. by the forced exchange of Sicily for the island of Sardinia. It was thus that in 1720 the house of Savoy assumed the regal title which it bore until the declaration of the Italian kingdom in the last century. Victor Amadeus II.'s reign was of great importance in the history of his state. Though a despot, as all monarchs were obliged to be at that date, he reigned with prudence, probity and zeal for the welfare of his subjects. He took public education out of the hands of the Jesuits, which, for the future development of manliness in his dominions, was a measure of incalculable value. The duchy of Savoy in his days became a kingdom, and Sardinia, though it seemed a poor exchange for Sicily, was a far less perilous possession than the larger and lethargic island would have been. Charles III. died in 1734, and his manhood abdicated in favour of his son Charles Emmanuel III. Repenting of this step, he subsequently attempted to regain Turin, but was imprisoned in the castle of Rivoli, where he ended his days in 1732.

The War of the Polish Succession which now disturbed Europe is only important in Italian history because the treaty of Vienna in 1738 settled the disputed affairs of the duchies of Parma and Tuscany. The duke Antonio Farnese died in 1731; the grand-duke Gian Gastone de' Medici died in 1737. In the duchy of Parma Don Carlos had already been proclaimed. But he was now transferred to the Two Sicilies, while Francis of Lorraine, the husband of Maria Theresa, took Tuscany and Parma. Milan and Mantua remained in the hands of the Austrians. On this occasion Charles Emmanuel acquired Tortona and Novara.

Worse complications ensued for the Italians when the emperor Charles VI., father of Maria Theresa, died in 1740. The three branches of the Bourbon house, ruling in France, Spain and the Sicilies, joined with Prussia, Bavaria and the kingdom of Sardinia to depose Maria Theresa of her heritage. Lombardy was made the seat of war; and here the king of Sardinia acted as in some sense the arbiter of the situation. After war broke out, he changed sides and supported the Habsburg-Lorraine party. At first, in 1745, the Sardinians were defeated by the French and Spanish troops. But Francis of Lorraine, elected emperor in that year, sent an army to the king's support, which in 1746 obtained a signal victory over the Bourbons at Piacentino. Charles Emmanuel now threatened Genoa. The Austrian soldiers already held the town. But the citizens expelled them, and the republic kept its independence. In 1748 the treaty of Aix-la-Chapelle, which put an end to the War of the Austrian Succession, once more divided Italy. Parma, Piacenza and Guastalla were formed into a duchy for Don Philip, brother of Charles III. of the Two Sicilies, and son of Philip V. of Spain. Charles III. was confirmed in his kingdom of the Two Sicilies. The Austrians kept Milan and Tuscany. The duchy of Modena was placed under the protection of the French. So was Genoa, which in 1755, after Paoli's insurrection against the misgovernment of the republic, ceded her old domain of Corsica to France.

From the date of this settlement until 1792, Italy enjoyed a period of repose and internal amelioration under her numerous paternal despots. It became the fashion during these forty-four years of peace to encourage the industrial population and to experimentalize in economical reforms. The Austrian government in Lombardy under Maria Theresa was characterized by improved agriculture, regular administration, order, reformed taxation and increased education. A considerable amount of local autonomy was allowed, and dependence on Vienna was very slight and not irksome. The nobles and the clergy were rich and influential, but kept in order by the civil power. There was no feeling of nationality, but the people were prosperous, enjoyed profound peace and were placidly content with the existing order of things. On the death of Maria Theresa in 1780, the emperor Joseph II. instituted much wider reforms. Feudal privileges were done away with, clerical influence diminished and many monasteries and convents suppressed, the criminal law rendered more humane and torture abolished largely as a result of G. Beccaria's famous pamphlet Dei delitti e delle pene. At the same time Joseph's administration was more arbitrary, and local autonomy was to some extent curtailed. His anti-clerical laws produced some ill-feeling among the more devout part of the population. On the whole the Austrian rule in pre-revolutionary days was beneficial and far from oppressive, and helped Lombardy to recover from the ill-effects of the Spanish domination. It did little for the moral education of the people, but the same criticism applies more or less to all the European governments of the day. The emperor Francis I. ruled the grand-duchy of Tuscany by lieutenants until his death in 1765, when it was given, as an independent state, to his second son, Peter Leopold. The reign of this duke was long remembered by the people of Tuscany as a period of material prosperity, wise legislation and an important public enterprise. Leopold, among other useful works, drained the Val di Chiana, and restored those fertile upland plains to agriculture. In 1790 he succeeded to the empire, and left Tuscany to his son Ferdinand. The kingdom of Sardinia was administered upon similar principles, but with less of geniality. Charles Emmanuel made his will law, and erased the remnants of free institutions from his state. At the same time he wisely followed his father's policy with regard to education and the church. This is perhaps the best that can be said of a king who incarnated the stolid absolutism of the period. From this date, however, we are able to trace the revival of independent thought among the Italians. The European ferment of ideas which preceded the French Revolution expressed itself in men like Alberi, the fierce denouncer of tyrants, Beccaria, the philosopher of criminal jurisprudence, Volta, the physicist, and numerous political economists of Tuscany. Moved partly by external influences and partly by a slow internal reawakening, the people was preparing for the efforts of the 19th century.

The papacy, during this period, had to reconsider the question of the Jesuits, who made themselves universally odious, not only in Italy, but also in France and Spain. In the pontificate of Clement XIII. they ruled the Vatican, and almost succeeded in embroiling the pope with the concerted Bourbon potentes of Europe. His successor, Clement XIV. suppressed the order altogether by a brief of 1773.

J. A. S.)

D. ITALY IN THE NAPOLEONIC PERIOD, 1796-1814

The campaign of 1796 which led to the awakening of the Italian people to a new consciousness of unity and strength is detailed in the article NAPOLEONIC CAMPAIGNS. Here we can attempt only a general survey of the events, political, civic and social, which heralded the Risorgimento in its first phase. It is desirable in the first place to realize the condition of Italy at the time when the irritation of the French and the expulsion of the Austrians opened up a new political vista for that oppressed and divided people.

For many generations Italy had been banded to and fro between the Habsburgs and the Bourbons. The decline of French influence at the close of the reign of Louis XIV. left the Habsburgs and the Spanish Bourbons without serious rivals. The former possessed the rich duchies of Milan (including Mantua) and Tuscany; while through a marriage alliance with the house of Este of Modena (the Archduke Ferdinand had married the heiress of Modena) its influence over that duchy was supreme. It also had a few fiefs in Piedmont and in Genoese territory. By marrying her daughter, Maria Amelia, to the young duke of Parma, and another daughter, Maria Carolina, to Ferdinand of Naples, Maria Theresa consolidated Habsburg influence in the north and south of the peninsula. The Spanish Bourbons held Naples and Sicily, as well as the duchy of Parma.
Of the nominally independent states the chief were the kingdom of Sardinia, ruled over by the house of Savoy, and comprising Piedmont, the isle of Sardinia and nominally Savoy and Nice, though the two provinces last named had virtually been lost to the monarch since the campaign of 1793. Equally extensive, but less important in the political sphere, were the Papal States and Venetia, the former torpid under the obscurantist rule of pope and cardinals, the latter enervated by luxury and the policy of unmanly complaisance long pursued by doge and council. The ancient rival of Venice, Genoa, was likewise far gone in decline. The small states, Lucca and San Marino, completed the map of Italy. The worst governed part of the peninsula was the south, where feudalism lay heavily on the cultivators and corruption pervaded all ranks. Milan and Piedmont were comparatively well governed; but repugnance to Austrian rule in the former case, and the contagion of French Jacobinical opinions in the latter, brought those populations into increasing hostility to the rulers. The democratic propensities which was permeating all the large towns of the peninsula, then led to the formation of numerous and powerful clubs and secret societies; and the throne of Victor Amadeus III., of the house of Savoy, soon began to totter under the blows delivered by the French troops at the mountain barriers of his kingdom and under the insidious assaults of the friends of liberty at Turin. Plotting was rife at Milan, as also at Bologna, where the memory of old liberties predisposed men to cast off clerical rule and led to the first rising on behalf of Italian liberty in the year 1794. At Palermo the Sicilians struggled hard to establish a republic in place of the odious government of an alien dynasty. The anathemas of the pope, the bravery of Piedmontese and Austrians, and the subsidies of Great Britain failed to keep the league of Italian princes against France intact. The grand-duke of Tuscany was the first of the European sovereigns who made peace with, and recognized the French republic, early in 1795. The first fortnight of Napoleon’s campaign of 1796 detached Sardinia from alliance with Austria and England. The enthusiasm of the Italians for the young Corsican “liberator” greatly helped his progress. Two months later Ferdinand of Naples sought for an armistice, the central duchies were easily overrun, and, early in 1797, Pope Pius VI. was fain to sign terms of peace with Bonaparte at Tolentino, practically ceding the northern part of his states, known as the Legations. The surrender of the last Habsburg stronghold, Mantua, on the 2d of February 1797 left the field clear for the erection of new political institutions.

Already the men of Reggio, Modena and Bologna had declared for a democratic policy, in which feudalism and clerical rule should have no place, and in which manhood suffrage, together with other rights promised by Bonaparte to the men of Milan in May 1796, should form the basis of a new order of things. In taking this step the Modenese and Romagnols had the encouragement of Bonaparte, despite the orders which the French directory sent to him in a contrary sense. The result was the formation of an assembly at Modena which abolished feudal dues and customs, declared for manhood suffrage and established the Cispadane Republic (October 1796).

The close of Bonaparte’s victorious campaign against the Archduke Charles in 1797 enabled him to mature those designs respecting Venice which are detailed in the article NAPOLÉON. On a far higher level was his conduct towards the Milanese. While the French directory saw in that province little more than a district which might be plundered and bargained for, Bonaparte, though by no means remiss in the exaction of gold and of artistic treasures, was laying the foundation of a friendly republic. During his sojourn at the castle of Mirepoix or Mombello, near Milan, he commissioned several of the leading men of northern Italy to draw up a project of constitution and list of reforms for that province. Meanwhile he took care to curb the excesses of the Italian Jacobins and to encourage the Moderates, who were favourable to the French connexion as promising a guarantee against Austrian domination and internal anarchy. He summed up his conduct in the letter of the 8th of May 1797 to the French directory, “I cool the hot heads here and warm the cool ones.” The Cispadane Republic, or, as it was soon called, the Cisalpine Republic, began its organized life on the 9th of July 1797, with a brilliant festival at Milan. The constitution was modelled on that of the French directory, and, lest there should be a majority of clerical or Jacobinical deputies, the French Republic through its general, Bonaparte, nominated and appointed the first deputies and administrators of the new government. In the same month it was joined by the Cispadane Republic; and the terms of the treaty of Campo Formio (October 17, 1797), while fatal to the political life of Venice, awarded to this now considerable state the Venetian territories west of the river Adige. A month later, under the pretence of stilling the civil strifes in the Vallettine, Bonaparte absorbed that Swiss district in the Cisalpine Republic, which included all the lands between Como and Verona on the north, and Rimini on the south.

Early in the year 1798 the Austrians, in pursuance of the scheme of partition agreed on at Campo Formio, entered Venice and brought to an end its era of independence which had lasted some 1100 years. Venice with its mainland territories east of the Adige, inclusive of Istria and Dalmatia, went to the Habsburgs, while the Venetian isles of the Adriatic (the Ionian Isles) and the Venetian fleet went to strengthen France for that eastern expedition on which Bonaparte had already set his heart. Venice not only paid the costs of the war to the two chief belligerents, but her naval resources also helped to launch the young general on his career of eastern adventure. Her former rival, Genoa, had also been compelled, in June 1797, to bow before the young conqueror, and had undergone at his hands a remodelling on the lines already followed at Milan. The new Genoese republic, French in all but name, was renamed the Ligurian Republic.

Before he set sail for Egypt, the French had taken possession of Rome. Already masters of the papal fortress of Ancona, they began openly to challenge the pope’s authority at the Eternal City itself. Joseph Bonaparte, then French envoy to the Vatican, encouraged democratic manifestations; and one of them, at the close of 1797, led to a scuffle in which a French general, Duhot, was killed. The French directory at once ordered its general, Berthier, to march to Rome: the Roman democrats proclaimed a republic on the 15th of February 1798, and on their invitation Berthier and his troops marched in. The pope, Pius VI., was forthwith haled away to Siena and a year later to Valence in the south of France, where he died. Thus fell the temporal power. The “liberators” of Rome thereafter proceeded to plunder the city in a way which brought shame on their cause and disgrace (perhaps not wholly deserved) on the general left in command, Masséna.

These events brought revolution to the gates of the kingdom of Naples, the worst-governed part of Italy, where the boorish king, Ferdinand IV. (il re lazzareto, he was termed), and his whimsical consort, Maria Carolina, scarcely held in check the discontent of their own subjects. A British fleet under Nelson, sent into the Mediterranean in May 1798 primarily for their defence, checkmated the designs of Bonaparte in Egypt, and then, returning to Naples, encouraged that court to adopt a spirited policy. It is now known that the influence of Nelson and of the British ambassador, Sir William Hamilton, and Lady Hamilton precipitated the rupture between Naples and France. The results were disastrous. The Neapolitan troops first occupied Rome, but, being badly handled by their leader, the Austrian general, Mack, they were soon scattered in flight; and the Republican troops under General Championnet, after crushing the stubborn resistance of the lazzaroni, made their way into Naples and proclaimed the Parthenopean Republic (January 23, 1799). The Neapolitan Democrats chose five of their leading men to be directors, and titles and feudal dues and customs
were abolished. Much good work was done by the Republicans during their brief tenure of power but it soon came to an end owing to the outbreak of events which favoured a reaction against France.

The directors of Paris, not content with overrunning and plundering Switzerland, had outraged German sentiment in many ways. Further, at the close of 1798 they virtually compelled the young king of Sardinia, Charles Emmanuel IV., to abdicate at Turin. He retired to the island of Sardinia, while the French despoiled Piedmont, thereby adding fuel to the resentment rapidly growing against them in every part of Europe.

The outcome of it all was the War of the Second Coalition, in which Russia, Austria, Great Britain, Naples and some secondary states of Germany took part. The incursion of an Austro-Russian army, led by that strange but magnetic being, Suvarov, decided the campaign in northern Italy. The French, poorly handled by Schérer and Sérurier, were everywhere beaten, especially at Magnano (April 5) and Cassano (April 27). Milan and Turin fell before the allies, and Moreau, who took over the command, had much difficulty in making his way to the Genoese coast line. There he awaited the arrival of Macdonald with the army of Naples.

That general, Championnet’s successor, had been compelled by these reverses and by the threatening pressure of Napoleon’s fleet to evacuate Naples and central Italy. In many parts the peasants and townsfolk, enraged by the licence of the French, hung on his flank and rear. The republics set up by the French at Naples, Rome and Milan collapsed as soon as the French troops retired; and a reaction in favour of clerical and Austrian influence set in with great violence. For the events which then occurred at Naples, so compromising to the reputation of Nelson, see Nelson and Naples. Sir William Hamilton was subsequently recalled in a manner closely resembling a disgrace, and his place was taken by Paget, who behaved with more dignity and tact.

Meanwhile Macdonald, after struggling through central Italy, had defeated an Austrian force at Modena (June 12, 1799), but Suvarov was able by swift movements utterly to overthrow him at the Trebbia (June 17–19). The wreck of his force drifted away helplessly towards Genoa. A month later the ambitious young general, Joubert, who took over Moreau’s command and rallied part of Macdonald’s following, was utterly routed by the Austro-Russian army at Novi (August 15) with the loss of 12,000 men. Joubert perished in the battle. The growing friction between Austria and Russia led to the transfer of Suvarov and his Russians to Switzerland, with results which were to be fatal to the allies in that quarter. But in Italy the Austrian successes continued. Melas defeated Championnet near Coni on the 4th of November; and a little later the French garrisons at Ancona and Coni surrendered. The tricolour, which floated triumphantly over all the strongholds of Italy early in the year, at its close waved only over Genoa, where Masséna prepared for a stubborn defence. Nice and Savoy also seemed to the mercy of the invaders. Everywhere the old order of things was restored. The death of the aged Pope Pius VI. at Valence (August 29, 1799) deprived the French of whatever advantage they had hoped to gain by dragging him into exile; on the 24th of March 1800 the conclave, assembled for greater security on the island of San Giorgio at Venice, elected a new pontiff, Pius VII.

Such was the position of affairs when Bonaparte returned from Egypt and landed at Fréjus. The contrast presented by his triumphs, whether real or imaginary, to the reverses sustained by the armies of the French directory, was fatal to that body and to popular institutions. France had a new état d’esprit (November 1799) he, as First Consul, began to organize an expedition against the Austrians (Russia having now retired from the coalition), in northern Italy. The campaign culminating at Marengo was the result. By that triumph (due to Desaix and Kellermann rather than directly to him), Bonaparte consolidated his own position in France and again laid Italy at his feet. The Austrian general, Melas, signed an armistice whereby he was to retire with his army beyond the river Mincio. Ten days earlier, namely on the 4th of June, Masséna had been compelled by hunger to capitulate at Genoa; but the success at Marengo, followed up by that of Macdonald in north Italy, and Moreau at Hohenlinden (December 2, 1800), brought the emperor Francis to sue for peace which was finally concluded at Lunéville on the 9th of February 1801. The Cisalpine and Ligurian Republics (reconstituted soon after Marengo) were recognized by Austria on condition that they were independent of France. The rule of Pius VII. over the Papal States was admitted; and Italian affairs were arranged much as they were at Campo Formio: Modena and Tuscany now reverted to French control, their former rulers being promised compensation in Germany. Naples, easily worsted by the French, under Miotto, left the British alliance, and made peace by the treaty of Florence (March 1801), agreeing to withdraw her troops from the Papal States, to cede Piombino and the Presidii (in Tuscany) to France and to close her ports to British ships and commerce. King Ferdinand also had to accept a French garrison at Taranto, and other points in the south.

Other changes took place in that year, all of them in favour of Napoleon. By complex and secret bargaining with the court of Madrid, Bonaparte procured the cession to France of Spanish Louisiana, in North America, and Parma; while the duke of Parma (husband of an infant of Spain) was promoted by him to the duchy of Tuscany, now renamed the kingdom of Etruria. Piedmont was declared to be a military division at the disposal of France (April 21, 1801); and on the 21st of September 1802, Bonaparte, then First Consul for life, issued a decree for its definitive incorporation in the French Republic. About that time, too, Elba fell into the hands of Napoleon. Piedmont was organized in six departments on the model of those of France, and a number of French veterans were settled by Napoleon in and near the fortress of Alessandria. Besides copying the Roman habit of planting military colonies, the First Consul imitated the old conquerors of the world by extending and completing the road-system of his oulying districts, especially at those important passes, the Mont Cenis and Simplon. He greatly improved the rough track over the Simplon Pass, so that, when finished in 1807, it was practicable for artillery. Milan was the terminus of the road, and the construction of the Foro Buonaparte and the completion of the cathedral added dignity to the Lombard capital. The Corniche road was improved; and public works in various parts of Piedmont, and the Cisalpine and Ligurian Republics attested the foresight and wisdom of the great organizer of industry and quickener of human energies. The old domains of Parma and Bologna were re-opened and made great progress in this time of peace and growing prosperity. Somewhat later the Pavia canal was begun in order to connect Lake Como with the Adriatic for barge-traffic.

The personal nature of the tie binding Italy to France was illustrated by a curious incident of the winter of 1802–1803. Bonaparte, now First Consul for life, felt strong enough to impose his will on the Cisalpine Republic and to set at defiance one of the stipulations of the treaty of Lunéville. On the pretext of consolidating that republic, he invited 450 of its leading men to come to Lyons to a consulta. In reality he and his agents had already provided for the passing of proposals which were agreeable to him. The deputies having been dazzled by fêtes and reviews, Talleyrand and Marescalchi, ministers of foreign affairs at Paris and Milan, pitted them with hints as to the course to be followed by the congress, and, despite the rage of the more democratic of their number, everything corresponded to the wishes of the First Consul. It remained to find a chief. Very many were in favour of Count Melzi, a Lombard noble, who had been chief of the executive at Milan; but again Talleyrand and French agents set to work on behalf of their master, with the result that he was elected president for ten years. He accepted that office because, as he frankly informed the deputies, he had found no one who "for his services rendered to his country, his authority with the people and his separation from party
Italy

The Napoleonic Period

Italy has deserved such an office." Melzi was elected vice-president with merely honorary functions. The constitution comprised a consuls charged with executive duties, a legislative body of 150 members and a court charged with the maintenance of the fundamental laws. These three bodies were to be chosen by three electoral colleges consisting of (a) landed proprietors, (b) learned men and clerics, (c) merchants and traders, holding their sessions biennially at Milan, Bologna and Brescia respectively. In practice the consuls could override the legislature; and, as the consuls was little more than the organ of the president, the whole constitution may be pronounced as autocratic as that of France after the changes brought about by Bonaparte in August 1802. Finally we must note that the Cisalpine now took the name of the Italian Republic, and that by a concordat with the pope, the Bonaparte regulated its relations to the Holy See in a manner analogous to that adopted in the famous French concordat promulgated at Easter 1802 (see Concordat). It remains to add that the Ligurian Republic and that of Lucca remodelled their constitutions in a way somewhat similar to that of the Cisalpine.

Bonaparte's ascendency did not pass unchallenged. Many of the Italians retained their enthusiasm for democracy and national independence. In 1803 movements in these directions took place at Rimini, Brescia and Bologna; but they were sharply repressed, and most Italians came to acquiesce in the Napoleonic supremacy as inevitable and indeed beneficial. The complete disregard shown by Napoleon for one of the chief conditions of the treaty of Lunéville (February 1801)—that stipulating for the independence of the Ligurian and Cisalpine Republics—became more and more apparent every year. Alike in political and commercial affairs they were for all practical purposes dependencies of France. Finally, after the proclamation of the French empire (May 18, 1804) Napoleon proposed to place his brother Joseph over the Italian state, which now took the title of kingdom of Italy. On Joseph declining, Napoleon finally decided to accept the crown which Melzi, Marescalchi, Serbelloni and others begged him to assume. Accordingly, on the 26th of May 1805, in the cathedral at Milan, he crowned himself with the iron crown of the old Lombard kings, using the traditional formula, "God gave it me; let him beware who touches it." On the 7th of June he appointed his stepson, Eugène Beauharnais, to be viceroy. Eugène soon found that his chief duty was to enforce the will of Napoleon. The legislature at Milan having ventured to alter some details of taxation, Eugène received the following rule of conduct from his stepfather: "Your system of government is simple: the emperor wills it to be thus." Republicanism was now everywhere discouraged. The little republic of Lucca, along with Piombino, was now awarded as a principality by the emperor to Elisa Bonaparte and her husband, Bacciochi.

In June 1805 there came a last and intolerable affront to the emperors of Austria and Russia, who, at that very time were seeking to put bounds to Napoleon’s ambition and to redress the balance of power. The French emperor, at the supposed request of the doge of Genoa, declared the Ligurian Republic to be an integral part of the French empire. This defiance to the sovereigns of Russia and Austria rekindled the flames of war. The third coalition was formed between Great Britain, Russia and Austria, Naples soon joining its ranks.

For the chief events of the ensuing campaigns see Napoleonic Campaigns. While Masséna pursued the Austrians into their own lands at the close of 1805, Italian forces under Eugène and Gouvion St Cyr (q.v.) held their ground against allied forces landed at Naples. After Austerlitz (December 2, 1805) Austria made peace by the treaty of Pressburg, ceding to the kingdom of Italy her part of Venetia along with the provinces of Istria and Dalmatia. Napoleon then turned fiercely against Maria Carolina of Naples upbraiding her with her "perfidy." He sent Joseph Bonaparte and Masséna southwards with a strong column, compelled the Anglo-Russian forces to evacuate Naples, and occupied the south of the peninsula with little opposition except at the fortress of Gaeta. The Bourbon court sailed away to Palermo, where it remained for eight years under the protection afforded by the British fleet and a British army of occupation. On the 15th of February 1806 Joseph Bonaparte entered Naples in triumph, his troops capturing there two hundred pieces of cannon. Gaeta, however, held out stoutly against the French. Sir Sidney Smith with a British squadron captured Capri (February 1806), and the peasants of the Abruzzi and Calabria soon began to give trouble. Worst of all was the arrival of a small British force in Calabria under Sir John Stuart, which beat off with heavy loss an attack imprudently delivered by General Réynier on level ground near the village of Maidia (July 4). The steady volleys of Kemp's light infantry were fatal to the French, who fell back in disorder under a bayonet charge of the victors, with the loss of some 2700 men. Calabria now rose in revolt against King Joseph, and the peasants dealt out savage reprisals to the French troops. On the 18th of July, however, Gaeta surrendered to Marmont, and that marshal, now moving rapidly southwards, extricated Réynier, crushed the Bourbon rising in Calabria with great barbarity, and compelled the British force to re-embark for Sicily. At Palermo Queen Maria Carolina continued to make vehement but futile efforts for the overthrow of King Joseph.

It is more important to observe that under Joseph and his ministers or advisers, including the Frenchmen Roederer, Dumas, Miot de Mélito and the Corsican Saliceti, great progress was made in abolishing feudal laws and customs, in reforming the judicial procedure and criminal laws on the model of the Code Napoléon, and in attempting the beginnings of elementary education. More questionable was Joseph's policy in closing and confiscating the property of 213 of the richer monasteries of the land. The monks were pensioned off, but though the confiscated property helped to fill the empty coffers of the state, the measure aroused widespread alarm and resentment among that superstitious people.

The peace of Tilsit (July 7, 1807) enabled Napoleon to press on his projects for securing the command of the Mediterranean, thenceforth a fundamental axiom of his policy. Consequently, in the autumn of 1807 he urged on Joseph the adoption of vigorous measures for the capture of Sicily. Already, in the negotiations with England during the summer of 1806, the emperor had shown his sense of the extreme importance of gaining possession of that island, which indeed caused the breakdown of the peace proposals then being considered; and now he ordered French squadrons into the Mediterranean in order to secure Corfu and Sicily. His plans respecting Corfu succeeded. That island and some of the adjacent isles fell into the hands of the French (some of them were captured by British troops in 1809–10); but Sicily remained unsailable. Capri, however, fell to the French on the 18th of October 1808, shortly after the arrival at Naples of the new king, Murat.

This ambitious marshal, brother-in-law of Napoleon, foiled in his hope of gaining the crown of Spain, received that of Naples in the summer of 1808, Joseph Bonaparte being moved from Naples to Madrid. This arrangement pleased neither of the relatives of the emperor; but his will now was law on the continent. Joseph left Naples on the 23rd of May 1808; but it was not until the 6th of September that Joachim Murat made his entry. A fortnight later his consort Caroline arrived, and soon showed a vigour and restlessness of spirit which frequently clashed with the dictates of her brother, the emperor and the shrewy, unsteady policy of her consort. The Spanish national rising of 1808 and thereafter the Peninsular War diverted Napoleon's attention from the affairs of south Italy. In June 1809, during his campaign against Austria, Sir John Stuart with an Anglo-Sicilian force sailed northwards, captured Ischia and threw Murat into great alarm; but on the news of the Austrian defeat at Wagram, Stuart sailed back again.

It is now time to turn to the affairs of central Italy. Early in 1808 Napoleon proceeded with plans which he had secretly concerted after the treaty of Tilsit for transferring the infanta
of Spain who, after the death of her consort, reigned at Florence on behalf of her young son, Charles Louis, from her kingdom of Etruria to the little principality of Entre Douro e Minho which he proposed to carve out from the north of Portugal. Etruria reverted to the French empire, but the Spanish princess and her son did not receive the promised indemnity. Elisa Bonaparte and her husband, Bacciochi, rulers of Lucca and Piombino, became the heads of the administration in Tuscany, Elisa showing decisive governing capacity.

The last part of the peninsula to undergo the Gallicizing influence was the papal dominion. For some time past the relations between Napoleon and the pope, Pius VII., had been so strained that bothatories, the Papal states, that the pontiff refused to grant the divorce between Jerome Bonaparte and the former Miss Patterson on which Napoleon early in the year 1806 laid so much stress. He believed the dispute led the emperor, as successor of Charlemagne, to treat the pope in a very high-handed way. “Your Holiness (he wrote) is sovereign of Rome, but I am its emperor”; and he threatened to annul the presumed “donation” of Rome by Charlemagne, unless the pope yielded implicit obedience to him in all temporal affairs. He further exploited the Charlemagne tradition for the benefit of the continental system, that great engine of commercial war by which he hoped to assure the ruin of England. This aim prompted the annexation of Tuscany, and his intervention in the affairs of the Papal States. To this the pope assented under pressure from Napoleon; but the latter soon found other pretenses for intervention, and in February 1808, a French column under Miollis occupied Rome, and deposed the papal authorities. Against this violence, Pius VII. protested in vain. Napoleon sought to push matters to an extreme, and on the 2nd of April he adopted the rigorous measure of annexing the kingdom of Italy the papal provinces of Ancona, Urbino, Macerata and Camerina. This measure, which seemed to the pious an act of sacrilege, and to Italian patriots an outrage on the only independent sovereign of the peninsula, sufficed for the present. The outbreak of war in Spain, followed by the rupture with Austria in the spring of 1809, distracted the attention of the emperor. But after the occupation of Vienna the conqueror dated from that capital on the 17th of May, 1809, a decree virtually annexing Rome and the Patrimonium Petri to the French empire. Here again he cited the action of Charlemagne, his “august predecessor,” who had merely given “certain domains to the bishops of Rome as fiefs, though Rome did not thereby cease to be part of his empire.”

In reply the pope prepared a bull of excommunication against those who should infringe the prerogatives of the Holy See in this matter. Thereupon the French general, Miollis, who still occupied Rome, caused the pope to be arrested and carried him away northwards to Tuscany, whence to Savona; finally he was carried to Napoleon’s order, to Fontainebleau. Thus, in a few months, fell the temporal power of the papacy. By an imperial decree, of the 17th of February, 1810, Rome and the neighboring districts, including Spoleto, became part of the French empire. Rome thenceforth figured as its second city, and entered upon a new life under the administration of French officials. The Roman territory was divided into two departments—the Tiber and Trasimenus; the Code Napoleon was introduced, public works were set on foot and great advance was made in the material sphere. Nevertheless the harshness with which the emperor treated the Roman clergy and suppressed the monasteries caused deep resentment to the orthodox.

There is no need to detail the fortunes of the Napoleonic states in Italy. One and all they underwent the influences emanating from Paris, and in respect to civil administration, law, judicial procedure, education and public works, they all experienced great benefits, the results of which never wholly disappeared. On the other hand, they suffered from the rigorous measures of the continental system, which seriously crippled trade at the ports and were not compensated by the increased facilities for trade with France which Napoleon opened up. The drain of men to supply his armies in Germany, Spain and Russia was also a serious loss. A powerful Italian corps marched under Eugène Beauharnais to Moscow, and distinguished itself at Malo-Jaroslavitz, as also during the horrors of the retreat in the closing weeks of 1812. It is said that out of 27,000 Italians who entered Russia with Eugène, only 333 saw their country again. That campaign marked the beginning of the end for the Napoleonic domination in Italy as elsewhere. Murat, left in command of the Grand Army at Vilna, abandoned his charge and in the next year made overtures to the allies who coalesced against Napoleon.

For his vacillations at this time and his final fate, see Murat. Here it must suffice to say that the uncertainty caused by his policy in 1813–1814 had no small share in embarrassing Napoleon and in precipitating the downfall of his power in Italy. Eugène Beauharnais, viceroy of the kingdom of Italy, showed constant and courage; and but for the battle of Leipzig (October 16–19, 1813), his power crumbled away under the assaults of the now victorious Austrians. By an arrangement with Bavaria, they were able to march through Tirol and down the valley of the Adige in force, and overpowered the troops of Eugène whose position was fatally compromised by the defection of Murat and the dissensions among the Italians. Very many of them, distrusting both of these kings, sought to act independently in favour of an Italian republic. Lord William Bentinck with an Anglo-Sicilian force landed at Leghorn on the 8th of March, 1814, and issued a proclamation to the Italians bidding them rise against Napoleon in the interests of their own freedom. A little later he gained possession of Genoa. Amidst these schisms the defence of Italy collapsed. On the 16th of April, 1814, Eugène, on hearing of Napoleon’s overthrow at Paris, signed an armistice at Mantua by which he was enabled to send away the French troops beyond the Alps and entrust himself to the consideration of the allies. The Austrians, under General Bellegarde, entered Milan without resistance; and this event precluded the restoration of the old political order.

The arrangements made by the allies in accordance with the treaty of Paris (June 12, 1814) and the Final Act of the congress of Vienna (June 9, 1815), imposed on Italy boundaries which, roughly speaking, corresponded to those of the pre-Napoleonic era. To the kingdom of Sardinia, now reconstituted under Victor Emmanuel I., France ceded its old provinces, Savoy and Nice; and the allies, especially Great Britain and Austria, insisted on the addition to that monarchy of the territories of the former republic of Genoa, in respect of which the king took the title of duke of Genoa, in order to strengthen it for the duty of acting as a buffer state between France and the smaller states of central Italy. Austria recovered the Milanese, and all the possessions of the old Venetian Republic on the mainland, including Istria and Dalmatia. The Ionian Islands, formerly belonging to Venice, were, by a treaty signed at Paris on the 17th of February, 1815, placed under the protection of Great Britain. By an instrument signed on the 24th of April, 1815, the Austrian territories in north Italy were erected into the kingdom of Lombardo-Venetia, which, though an integral part of the Austrian empire, was to enjoy a separate administration, the symbol of its separate individuality being the coronation of the emperors with the ancient iron crown of Lombardy ("Proclamation de l’empereur d’Autriche, &c.," April 7, 1815, State Papers, ii. 906). Francis IV., son of the archduke Ferdinand of Austria and Maria Beatrice, daughter of Ercole Rinaldo, the last of the Estensi, was reinstated as duke of Modena. Parma and Piacenza were assigned to Marie Louise, daughter of the Austrian emperor and wife of Napoleon, on behalf of her son, the little Napoleon, but by subsequent arrangements (1816–1817) the duchy was to revert at her death to the Bourbons of Parma, then reigning at Lucca. Tuscany was restored to the grand-duke Ferdinand III. of Habsburg-Lorraine. The duchy of Lucca was given to Marie Louise of Bourbon-Parma, who, at the death of Marie Louise of Austria, would
return to Parma, when Lucca would be handed over to Tuscany. The pope, Pius VII., who had long been kept under restraint by Napoleon at Fontainebleau, returned to Rome in May 1814, and was recognized by the congress of Vienna (not without some demur on the part of Austria) as the sovereign of all the former possessions of the Holy See. Ferdinand IV. of Naples, not long after the death of his consort, Maria Carolina, in Austria, returned from Sicily to take possession of his dominions on the mainland. He received them back in their entirety at the hands of the powers, who recognized his new title of Ferdinand I. of the Two Sicilies. The rash attempt of Murat in the autumn of 1815, which led to his death at Pizzo in Calabria, enabled the Bourbon dynasty to crush malcontents with all the greater severity. The reaction, which was dull and heavy in the dominions of the pope and of Victor Emmanuel, systematically harsh in the Austrian states of the north, and comparatively mild in Parma and Tuscany, excited the greatest loathing in southern Italy and Sicily, because there it was directed by a dynasty which had aroused feelings of hatred mingled with contempt.

There were special reasons why Sicily should harbour these feelings against the Bourbons. During eight years (1806-1814) the chief places of the island had been garrisoned by British troops; and the commander of the force which upheld the tottering rule of Ferdinand at Palermo naturally had great authority. The British government, which awarded a large annual subsidy to the king and queen at Palermo, claimed to have some control over the administration. Lord William Bentinck finally took over large administrative powers, seeing that Ferdinand, owing to his dulness, and Maria Carolina, owing to her very suspicious intrigues with Napoleon, could never be trusted. The contest between the royal power and that of the Sicilian estates threatened to bring matters to a deadlock, until in 1812, under the impulse of Lord William Bentinck, a constitution modelled largely on that of England was passed by the estates. After the retirement of the British troops in 1814 the constitution lapsed, and the royal authority became once more absolute. But the memory of the benefits conferred by the British government led to them that truth, which once grasped can never be forgotten, that, despite differences of climate, character and speech, they were in all essentials a nation. (J. H. R.)

E. THE RISORGIMENTO, 1815-1870

As the result of the Vienna treaties, Austria became the real mistress of Italy. Not only did she govern Lombardy and Venetia directly, but Austrian princes ruled in Modena, Parma and Tuscany; Piacenza, Ferrara and Comacchio had Austrian garrisons; Prince Metternich, the Austrian chancellor, believed that he could always secure the election of an Austrophil pope, and Ferdinand of Naples, reinstated by an Austrian army, had bound himself, by a secret article of the treaty of June 12, 1815, not to introduce methods of government incompatible with those adopted in Austria's Italian possessions. Austria also concluded offensive and defensive alliances with Sardinia, Tuscany and Naples; and Metternich's ambition was to make Austrian predominance over Italy still more absolute, by placing an Austrian archduke on the Sardinian throne.

Victor Emmanuel I., the king of Sardinia, was the only native ruler in the peninsula, and the Savoy dynasty was popular with all classes. But although welcomed with enthusiasm on his return to Turin, he introduced a system of reaction which, if less brutal, was no less uncompromising than that of Austrian archdukes or Bourbon princes. His object was to restore his dominions to the conditions preceding the French occupation. The French system of taxation was maintained because it brought in ampler revenues; but feudalism, the antiquated legislation and bureaucracy were revived, and all the officers and officials still living who had served the state before the Revolution, many of them now in their dotage, were restored to their posts; only nobles were eligible for the higher government appointments; all who had served under the French administration were dismissed or reduced in rank, and in the army heartless scions of the aristocracy were placed over the heads of war-worn veterans who had commanded regiments in Spain and Russia. But influence of a bigoted priesthood was re-established, and "everything from an intellectual and moral torment, everything save actual persecution and physical torture that could be inflicted on the 'impure' was inflicted" (Cesare Balbo's Autobiography). All this soon provoked discontent among the educated classes. In Genoa the government was particularly unpopular, for the Genoese resented being handed over to their old enemy Piedmont like a flock of sheep. Nevertheless the king strongly disliked the Austrians, and would willingly have seen them driven from Italy.

In Lombardy French rule had ended by making itself unpopular, and even before the fall of Napoleon a national party, called the Italicii puri, had begun to advocate the independence of Lombardy, or even its union with Sardinia. At first a part of the population were content with Austrian rule, which provided an honest and efficient administration; but the rigid system of centralization which, while allowing the semblance of local autonomy, saved every minute question for some Austrian; the severe police methods; the bureaucracy, in which the best appointments were usually conferred on Germans or Slavs wholly dependent on Vienna, proved galling to the people, and in view of the growing disaffection the country was turned into a vast armed camp. In Modena Duke Francis proved a cruel tyrant. In Parma, on the other hand, there was very little oppression, the French codes were retained, and the council of state was consulted on all legislative matters. Lucca too enjoyed good government, and the peasantry were well cared for and prosperous. In Tuscany the rule of Ferdinand and of his minister Fossebronni was mild and benevolent, but enervating and demoralizing. The Papal States were ruled by a unique system of theocracy, for not only the head of the state but all the more important officials were ecclesiastics, assisted by the Inquisition, the Index and all the paraphernalia of medieval church government. The administration was inefficient and corrupt, the censorship uncompromising, the police ferocious and oppressive, although quite unable to cope with the prevalent anarchy and brigandage; the antiquated pontifical statutes took the place of the French laws, and every vestige of the vigorous old communal independance was swept away. In Naples King Ferdinand retained some of the laws and institutions of Murat's régime, and many of the functionaries of the former government entered his service; but he revived the Bourbon tradition, the odious police system and the censorship; and a degrading religious bigotry, to which the masses were all too much inclined, became the basis of government and social life. The upper classes were still to a large extent inoculated with French ideas, but the common people were either devoted to the royal family or indifferent. In Sicily, which for centuries had enjoyed a feudal constitution modernized and Anglicized under British auspices in 1812, and where anti-Neapolitan feeling was strong, autonomy
was suppressed, the constitution abolished in 1816, and the island, as a reward for its fidelity to the dynasty, converted into a Neapolitan province governed by Neapolitan bureaucrats.

To the mass of the people the restoration of the old governments undoubtedly brought a sense of relief, for the terrible drain in men and money caused by Napoleon's wars had caused much discontent, whereas now there was a prospect of peace and rest. But the restored governments in their terror of revolution would not realize that the late régime had wafted a breath of new life over the country and left ineffaceable traces in the way of improved laws, efficient administration, good roads and the sweeping away of old abuses; while the new-born idea of Italian unity, strengthened by a national pride revived on many a stricken field from Madrid to Moscow, was a force to be reckoned with. The oppression and follies of the restored governments made men forget the evils of French rule and remember only its good side. The masses were still more or less indifferent, but among the nobility and the educated middle classes, cut off from all part in free political life, there was developed either the spirit of despair at Italy's moral degradation, as expressed in the writings of Foscolo and Leopardi, or a passion of hatred and revolt, which found its manifestation, in spite of severe laws, in the development of secret societies. The most important of these were the Carbonari lodges, whose objects were the expulsion of the foreigner and the achievement of constitutional freedom (see CARBONARI).

When Ferdinand returned to Naples in 1815 he found the kingdom, and especially the army, honeycombed with Carbonarism, to which many noblemen and officers were affiliated; and although the police instituted prosecutions and organized the counter-movement of the Calderai, who may be compared to the "Black Hundreds" of modern Russia, the revolutionary spirit continued to grow, but it was not at first anti-dynastic. The granting of the Spanish constitution of 1820 proved the signal for the beginning of the Italian liberalist movement; a military mutiny led by two officers, Silvati and Morelli, and the priest Menichini, broke out at Monteforte, to the cry of "God, the King, and the Constitution!" The troops sent against them commanded by General Guglielmo Pepe, himself a Carbonaro, hesitated to act, and the king, finding that he could not count on the army, granted the constitution (July 13, 1820), and appointed his son Francis regent. The events that followed are described in the article on the history of Naples (q.v.). Not only did the constitution, which was modelled on the impossible Spanish constitution of 1812, prove unworkable, but the powers of the Grand Alliance, whose main object was to keep the peace of Europe, felt themselves bound to interfere to prevent the evil precedent of a successful military revolution. The diplomatic developments that led to the intervention of Austria are sketched elsewhere (see EUROPE: HISTORY); in general the result of the deliberations of the congresses of Troppau and Laibach was to establish, in the general right of intervention claimed in the Troppau Protocol, both the special right of Austria over its interests in Italy. The defeat of General Pepe by the Austrians at Rieti (March 7, 1821) and the re-establishment of King Ferdinand's autocratic power under the protection of Austrian bayonets were the effective assertion of this principle.

The movement in Naples had been purely local, for the Neapolitan Carbonari had at that time no thought save of Naples; it was, moreover, a movement of the middle and upper classes in which the masses took little interest. Immediately after the battle of Rieti a Carbonarist mutiny broke out in Piedmont independently of events in the south. Both King Victor Emmanuel and his brother Charles Felix had no sons, and the heir presumptive to the throne was Prince Charles Albert, of the Carignano branch of the house of Savoy. Charles Albert felt a certain interest in Liberal ideas and was always surrounded by young nobles of Carbonarist and anti-Austrian tendencies, and was therefore regarded with suspicion by his royal relatives. Metternich, too, had an instinctive dislike for him, and proposed to exclude him from the succession by marrying one of the king's daughters to Francis of Modena, and getting the Salic law abolished so that the succession would pass to the duke and Austria would thus dominate Piedmont. The Liberal movement had gained ground in Piedmont as in Naples among the younger nobles and officers, and the events of Spain and southern Italy aroused much excitement. In March 1821, Count Santorre di Santarosa and other conspirators informed Charles Albert of a constitutional and anti-Austrian plot, and asked for his help. After a momentary hesitation he informed the king; but at his request no arrests were made, and no precautions were taken. On the 10th of March the garrison of Alessandria mutinied, and its example was followed on the 12th by that of Turin, where the Spanish constitution was demanded, and the black, red and blue flag of the Carbonari paraded the streets. The next day the king abdicated after appointing Charles Albert regent. The latter immediately proclaimed the constitution, but the new king, Charles Felix, who was at Modena at the time, repudiated the regent's acts and exiled him to Tuscany; and, with his consent, an Austrian army invaded Piedmont and crushed the constitutionalists at Novara. Many of the conspirators were condemned to death, but all succeeded in escaping. Charles Felix was most indignant with the ex-regent, but he resented, as an unwarrantable interference, Austria's attempt to have him excluded from the succession at the congress of Verona (1822). Charles Albert's somewhat equivocal conduct also roused the hatred of the Liberals, and for a long time the esecrat宰 Carignano was regarded, most unjustly, as a traitor even by many who were not republicans.

Carbonarism had been introduced into Lombardy by two Romagnols, Count Laderchi and Pietro Maroncelli, but the leader of the movement was Count F. Confalonieri, who was in favour of an Italian federation composed of northern Italy under the house of Savoy, central Italy under the pope, and the kingdom of Naples. There had been some mild plotting against Austria in Milan, and an attempt was made to co-operate with the Piedmontese movement of 1821; already in 1820 Maroncelli and the poet Silvio Pellico had been arrested as Carbonari, and after the movement in Piedmont more arrests were made. The mission of Gaetano Castiglia and Marquis Giorgio Pallavicini to Turin, where they had interviewed Charles Albert, although without any definite result—for Confalonieri had warned the prince that Lombardy was not ready to rise—was accidentally discovered, and Confalonieri was himself arrested. The plot would never have been a menace to Austria but for her treatment of the conspirators. Pellico and Maroncelli were immersed in the Spielberg; Confalonieri and two dozen others were condemned to death, their sentences being, however, commuted to imprisonment in that same terrible fortress. The heroism of the prisoners, and Silvio Pellico's account of his imprisonment (Le mie prigioni), did much to enlist the sympathy of Europe for the Italian cause.

During the next few years order reigned in Italy, save for a few unrests. Important in the Papal States was there, however, perpetual discontent and agitation, especially in Romagna, where misgovernment was extreme. Under Pius VII and his minister Cardinal Consalvi oppression had not been very severe, and Metternich's proposal to establish a central inquisitorial tribunal for political offences throughout Italy had been rejected by the papal government. But on the death of Pius in 1823, his successor Leo XII. (Cardinal Della Genga) proved a ferocious reactionary under whom barbarous laws were enacted and torture frequently applied. The secret societies, such as the Carbonari, the Adelì and the Bersaglieri d'America, which flourished in Romagna, replied to these persecutions by assassinating the more brutal officials and spies. The events of 1820-1821 increased the agitation in Romagna, and in 1823 large numbers of persons were condemned to death, imprisonment or exile. The society of the Sanfedisti, formed of the dregs of the populace, whose object was to murder every Liberal, was openly protected and encouraged. Leo died

---

in 1829, and the mild, religious Pius VIII. (Cardinal Castiglioni) only reigned until 1830, when Gregory XVI. (Cardinal Cappellari) was elected through Austrian influence, and proved another zelote. The July revolution in Paris and the declaration of the new king, Louis Philippe I., was a Liberal monarchy, would not only not intervene in the internal affairs of other countries, but would not permit other powers to do so, aroused great hopes among the oppressed peoples, and was the immediate cause of a revolution in Romagna and the Marches. In February 1831 these provinces rose, raised the red, white and green tricolor (which henceforth took the place of the Carbonarist colours as the Italian flag), and shook off the papal yoke with surprising ease. At Parma too there was an outbreak and a demand for the constitution; Marie Louise could not grant it because of her engagements with Austria, and, therefore, abandoned her dominions. In Modena Duke Francis, ambitious of enlarging his territories, coquetted with the Carbonari of Paris, and opened indirect negotiations with Menotti, the revolutionary leader in his state, believing that he might assist him in his plans. Menotti, for his part, conceived the idea of a united Italian state under the duke. A rising was organized for February 1831; but Francis got wind of it, and, repenting of his dangerous dallying with revolution, arrested Menotti and fled to Austrian territory with his prisoner. In his absence the insurrection took place, and Biagio Nardi, having been elected dictator, proclaimed that "Italy is one; the Italian nation one sole nation." But the French king soon abandoned his principle of non-intervention on which the Italian revolutionists had built their hopes; the Austrians intervened unhindered; the old governments were re-established in Parma, Modena and Romagna; and Menotti and many other patriots were hanged. The Austrians evacuated Romagna in July, but another insurrection having broken out immediately afterwards which the papal troops were unable to quell, they returned. This second intervention gave umbrage to France, who by way of a counterpoise sent a force to occupy Ancona. These two foreign occupations, which were almost as displeasing to the pope as to the Liberals, lasted until 1838. The powers, immediately after the revolt, presented a memorandum to Gregory recommending certain moderate reforms, but no attention was paid to it. These various movements proved in the first place that the masses were by no means ripe for revolution, and that the idea of unity, although now advocated by a few revolutionary leaders, was far from being generally accepted even by the Liberals; and, secondly, that, in spite of the indifference of the masses, the despotical governments were unable to hold their own without the assistance of foreign bayonets.

On the 27th of April 1831, Charles Albert succeeded Charles Felix on the throne of Piedmont. Shortly afterwards he received a letter from an unknown person, in which he was exhorted with fiery eloquence to place himself at the head of the movement for liberating and uniting Italy, and expelling the foreigner, and told him he was free to choose whether he would be "the first of the men of the last of Italian tyrants." The author was Giuseppe Mazzini, then a young man of twenty-six years, who, though in theory a republican, was ready to accept the leadership of a prince of the house of Savoy if he would guide the nation to freedom. The only result of his letter, however, was that he was forbidden to re-enter Sardinian territory. Mazzini, who had learned to distrust Carbonarism owing to its lack of a guiding principle and its absurd paraphernalia of ritual and mystery, had conceived the idea of a more serious political association for the emancipation of his country not only from foreign and domestic despotism but from national faults of character; and this idea he had materialized in the organization of a society called the Giovane Italia (Young Italy) among the Italian refugees at Marseilles. After the events of 1831 he declared that the liberation of Italy could only be achieved through unity, and his great merit lies in having inspired a large number of Italians with that idea at a time when provincial jealousies and the difficulty of communications maintained separatist feelings. Young Italy spread to all centres of Italy, except and by means of its literature carried on these movements, all Italy in itself, while the parties came to be called "Ghibellini," as though reviving the traditions of medieval anti-Papalism. Though eventually this activity of the Giovane Italia supplanted that of the older societies, in practice it met with no better success; the two attempts to invade Savoy in the hope of seducing the army from its allegiance failed miserably, and only resulted in a series of barbarous sentences of death and imprisonment which made most Liberals despair of Charles Albert, while they called down much criticism on Mazzini as the organizer of raids in which he himself took no part. He was now forced to leave France, but continued his work of agitation from London. The disorders in Naples and Sicily in 1837 had no connexion with Mazzini, but the forlorn hope of the brothers Bandiera, who in 1844 landed on the Calabrian coast, was the work of the Giovane Italia. The rebels were captured and shot, but the significance of the attempt lies in the fact that it was the first occasion on which north Italians (the Bandieras were Venetians and officers in the Austrian navy) had tried to raise the standard of revolt in the south.

Romagna had continued a prey to anarchy ever since 1831; the government organized armed bands called the Centurioni (descended from the earlier Sanfedisti), to terrorize the Liberals, while the secret societies continued their "propaganda by deeds." It is noteworthy that Romagna was the only part of Italy where the revolutionary movements were accompanied by murder. In 1845 several outbursts occurred, and a band led by Pietro Renzi captured Rimini, whence a proclamation drawn up by L. C. Farini was issued demanding the reforms advocated by the powers' memorandum of 1831. But the movement collapsed without result, and the leaders fled to Tuscany.

By side with the Mazzinian propaganda in favour of a united Italian republic, which manifested itself in secret societies, plots and insurrections, there was another Liberal movement based on the organization of the Friends of Italy (Amici di Italia). In Piedmont, in spite of the government's reactionary methods, a large part of the population were genuinely attached to the Savoy dynasty, and the idea of a regeneration almost of Italy under Savoy was held by many. Some writers proclaimed the necessity of building railways, developing agriculture and encouraging industries, before resorting to revolution; while others, like the Tuscan Gino Capponi, inspired by the example of England and France, wished to make the people fit for government on the model of the English. Periodicals like Vincenzo Gioberti's (q.v.) published in 1843 his famous treatise Del primato morale e civile degli Italiani, a work, which, in striking contrast to the prevailing pessimism of the day, extolled the past greatness and achievements of the Italian people and their present virtues. His political ideal was a federation of all the Italian states under the presidency of the pope, on a basis of Catholicism, but without a constitution. In spite of all its inaccuracies and exaggerations the book served a useful purpose in reviving the self-respect of a despondent people. Another work of a similar kind was Le Speranze d'Italia (1844) by the Piedmontese Count Cesare Balbo (q.v.). Like Gioberti he advocated a federation of Italian states, but he declared that before this could be achieved Austria must be expelled from Italy, and that it was necessary to make Austria more effective, giving her a Danubian power—a curious forecast that Italy's liberation would begin with an eastern war. He extolled Charles Albert and appealed to his patriotism; he believed that the church was necessary to a great extent, and that the Catholic princes were the only rulers fit to govern a united Italy. His work was undervalued, but he advocated a consultative assembly. Above all Italian character must be reformed and the nation educated. A third important publication was Massimo d'Azeglio's Degli ultimi casi di Romagna, in which the author, another Piedmontese, condemned the secret societies and advocating open resistance and protest. He upheld the papacy in principle, regarded Austria as the great enemy of Italian regeneration, and believed that the means of expelling her were only to be found in Piedmont. Besides the revolutionists and republicans who promised conspiracy and insurrection whenever possible, and the moderates or "Neo-Guelphs," as Gioberti's followers were called, we must mention the Italian exiles who were learning the art of war in foreign countries—spending time in France, Italy, East and West in America—and those other exiles who, in Paris or London, eked out a bare subsistence by teaching Italian or French.
by their pen, and laid the foundations of that love of Italy which, especially in England, eventually brought the weight of diplomacy into the hands of Italian freedom. All these forces were equally necessary—the revolutionists to keep up agitation and make government impossible; the moderates to curb the brutality of the revolutionists and to present a scheme of society that was neither reactionary nor anarchical; the volunteers abroad to gain military experience; and the more peaceful exiles to spread the name of Italy among foreign peoples. All the while a vast amount of revolutionary literature was being printed in Switzerland, France and England, and smuggled into Italy; the poet Giusti satirized the Italian princes, the dramatist G. B. Niccolini blasted tyranny in his tragedies, the young Garibaldi mocked the memories of the struggle for Florentine freedom in L'Assedio di Firenze, and Verdi's operas bristled with political double entendres which escaped the censor but were understood and applauded by the audience.

On the death of Pope Gregory XVI. in 1846 Austria hoped to secure the election of another zealot; but the Italian cardinals, who did not want an Austrophil, finished the conclave before the arrival of Cardinal Gaysruck, Austria's mouthpiece, and in June elected Giovanni Maria Mastai Ferretti as Pius IX. The new pope, who while bishop of Imole had evinced a certain interest in Liberalism, was a kindly and inferior intellectual, who thought that all difficulties could be settled with a little good-will, some reforms and a political amnesty. The amnesty which he granted was the beginning of the immense if short-lived popularity which he was to enjoy. But he did not move so fast in the path of reform as was expected, and agitation continued throughout the papal states. In 1847 some administrative reforms were enacted, the laity were admitted to certain offices, railways were talked about, and political newspapers permitted. In April Pius created a Consulta, or consultative assembly, and soon afterwards a council of ministers and a municipality for Rome. Here he would willingly have stopped, but he soon realized that he had hardly begun. Every fresh reform edict was greeted with demonstrations of enthusiasm, but the ominous cry "Viva Pio Nono solo!" signified dissatisfaction with the whole system of government. The lay ministry was now demanded, a constitution, and an Italian federation for war against Austria. Rumours of a reactionary plot by Austria and the Jesuits against Pius, caused him to create a national guard and to appoint Cardinal Ferretti as secretary of state.

Events in Rome produced widespread excitement throughout Europe. Metternich had declared that the one thing which had not entered into his calculations was a Liberal pope, only that was an impossibility; still he was much disturbed by Pius's attitude, and tried to stem the revolutionary tide by frightening the princes. Seizing the agitation in Romagna as a pretext, he had the town of Ferrara occupied by Austrian troops, which provoked the indignation not only of the Liberals but also of the pope, for according to the treaties Austria had the right of occupying the citadel alone. There was great resentment throughout Italy, and in answer to the pope's request Charles Albert declared that he was with Pius in spirit; while from South America Giuseppe Garibaldi wrote to offer his services to his Holiness. Charles Albert, although maintaining his reactionary policy, had introduced administrative reforms, built railways, reorganized the army and developed the resources of the country. He had little sympathy with Liberalism and abhorred revolution, but his hatred of Austria and his resentment at the galling tuteleage to which he was subjected made him aim to strengthen the year by year. Religion was still his dominant passion, and when a pope in Liberal guise appeared on the scene and was bullied by Austria, his two strongest feelings—pious and hatred of Austria—ceased to be incompatible. In 1847 Lord Minto visited the Italian courts to try to induce the recalcitrant despots to mend their ways, so as to avoid revolution and war, the latter being England's especial anxiety; this mission, although not destined to produce much effect, aroused extravagant hopes among the Liberals. Charles Louis, the operetta duke of Lucca, who had coquetted with Liberalism in the past, now refused to make any concessions to his subjects, and in 1847 sold his duchy to Leopold II. of Tuscany (the successor of Ferdinand III. since 1824) to whom it would have reverted in any case at the death of the duchess of Parma. At the same time Leopold ceded Lunigiana to Parma and Modena in equal parts, an arrangement which provoked the indignation of the inhabitants of the district (especially of those destined to be ruled by Francis V. of Modena, who had succeeded to Francis IV. in 1846), and led to disturbances at Fivizzano. In September 1847, Leopold gave way to the popular agitation for a national guard, in spite of Metternich's threats, and allowed greater freedom of the press; every concession made by the pope was followed by demands for a similar measure in Tuscany.

Ferdinand I. of the Two Sicilies had died in 1825, and was succeeded by Francis I. At the latter's death in 1830 Ferdinand II. succeeded, and although at first he gave promise of proving a wiser ruler, he soon reverted to the traditional Bourbon methods. An ignorant bigot, he concentrated the whole of the executive into his own hands, was surrounded by priests and monks, and served by an army of spies. In 1847 there were unimportant disturbances in various parts of the kingdom, but there was no anti-dynastic outbreak, the jealousy between Naples and Sicily largely contributing to the weakness of the movement. On the 12th of January, however, a revolution, the first of the many throughout Europe that was to make the year 1848 memorable, broke out at Palermo under the leadership of Ruggiero Settimo. The Neapolitan army sent to crush the rising was at first unsuccessful, and the insurgents demanded the constitution of 1812 or complete independence. Disturbances occurred at Naples also, and the king, who could not obtain Austrian help, as the pope refused to allow Austrian troops to pass through his dominions, on the advice of his prime minister, the duke of Serracapriola, granted a constitution, freedom of the press, the national guard, &c. (January 28).

The news from Palermo strengthened the demand for a constitution in Piedmont. Count Camillo Cavour, then editor of a new and influential paper called Il Risorgimento, had advocated it strongly, and monster demonstrations were held every day. The king disliked the idea, but great pressure was brought to bear on him, and finally, on the 4th of March 1848, he granted the charter which was destined to be the constitution of the future Italian kingdom. It provided for a nominated senate and an elective chamber of deputies, the king retaining the right of veto; the press censorship was abolished, and freedom of meeting, of the press and of speech were guaranteed. Balbo was called upon to form the first constitutional ministry. Three days later the grand-duke of Tuscany promised similar liberties, and a charter, prepared by a commission which included Gino Capponi and Bettino Ricasoli, was promulgated on the 17th.

In the Austrian provinces the situation seemed calmer, and the government rejected the moderate proposals of Daniele Mannin and N. Tommasini. A demonstration in favour of Pius IX. on the 3rd of January at Milan was dispersed with unnecessary severity, and martial law was proclaimed the following month. The revolution which broke out on the 8th of March in Vienna itself and the subsequent flight of Metternich (see AUSTRIA-HUNGARY: History), led to the granting of feeble concessions to Lombardy and Venetia, which were announced in Milan on the 18th. But it was too late; and in spite of the exhortations of the mayor, Gabrio Casati, and of the republican C. Cattaneo, who believed that a rising against 15,000 Austrian soldiers under Field-Marshal Radetzky was madness, the famous Five Days' revolution began. It was a popular outburst of pent-up hate, unprepared by leaders, although leaders such as Luciano Manara soon arose. Radetzky occupied the citadel and other points of vantage; but in the night barricades sprang up by the hundred and were manned by citizens of all classes, armed with every kind of weapon. The desperate struggle lasted until the 2nd, when the Austrians, having lost 5000 killed and wounded, were forced to evacuate the city. The rest of Lombardy and Venetia
Now flew to arms, and the Austrian garrisons, except in the Quadrilateral (Verona, Peschiera, Mantua and Legnano) were expelled. In Venice the people, under the leadership of Manin, rose in arms and in the name of Charles Albert (Carlo Felice, Ziche and Palffy) to sign a capitulation on the 22nd of March, after which the republic was proclaimed. At Milan, where there was a division of opinion between the monarchists under Casati and the republicans under Cattaneo, a provisional administration was formed and the question of the form of government postponed for the moment. The duke of Modena and Charles Louis of Parma (Marie Louise was now dead) abandoned their capitals; in both cities provisional governments were set up which subsequently proclaimed annexation to Piedmont. In Rome the pope gave way to popular clamour, granting one concession after another, and on the 8th of February he publicly called down God's blessing on Italy—that Italy hated by the Austrians, whose name it had hitherto been a crime to mention. On the 1oth of March he appointed a new ministry, under Cardinal Antonelli, which included several Liberal laymen, such as Marco Minghetti, G. Pasolini, L. C. Farini and Count G. Recchi. On the 11th a constitution drawn up by a commission of cardinals, without the knowledge of the ministry, was promulgated, a constitution which attempted the impossible task of reconciling the pope's temporal power with free institutions. In the meanwhile preparations for war against Austria were being carried on with Pius's sanction.

There were now three main political tendencies, viz. the union of north Italy under Charles Albert and an alliance with the pope and Naples, a federation of the different states under their present rulers, and a united republic of all Italy. All parties, however, were agreed in favour of war against Austria, for which the peoples forced their unwilling rulers to prepare. But the only state capable of taking the initiative was Piedmont, and the king still hesitated. Then came the news of the Five Days of Milan, which produced the wildest excitement in Turin; unless the army were sent to assist the struggling Lombards at once the dynasty was in jeopardy. Cavour's stirring articles in the Risorgimento hastened the king's decision, and on the 23rd of March he declared war (see for the military events Italian Wars, 1848-70). But much precious time had been lost, and even then the army was not ready. Charles Albert could dispose of 90,000 men, including some 30,000 from central Italy, but he took the field with only half his force. He might yet have cut off Radetzky on his retreat, or captured Mantua, which was only held by 300 men. But his delays lost him both chances and enabled Radetzky to receive reinforcements from Austria. The pope, unable to resist the popular demand for war, allowed his army to depart (March 23) under the command of General Durando, with instructions to act in concert with Charles Albert, and he corresponded with the grand-duke of Tuscany and the king of Naples with a view to a military alliance. But at the same time, fearing a schism in the church should he attack Catholic Austria, he forbade his troops to do more than defend the frontier, and in his Encyclical of the 29th of April stated that, as head of the church, he could not declare war, but that he was unable to prevent his subjects from following the example of other Italians. He then requested Charles Albert to take the papal troops under his command, and also wrote to the emperor of Austria asking him voluntarily to relinquish Lombardy and Venetia. Tuscany and Naples had both joined the Italian league; a Tuscan army started for Lombardy on the 30th of April, and 17,000 Neapolitans commanded by Pepe (who had returned after 28 years of exile) went to assist Durando in intercepting the Austrian reinforcements under Nugent. The Piedmontese defeated the enemy at Pastrengo (April 30), but did not profit by the victory. The Neapolitans reached Bologna on the 17th of May, but in the meantime a dispute had broken out at Naples between the king and parliament as to the nature of the royal oath; a cry of treason was raised by a group of factious youngsters, barricades were erected and street fighting ensued (May 15). On the 17th Ferdinand dissolved parliament and recalled the army.

On receiving the order to return, Pepe, after hesitating for some time between his oath to the king and his desire to fight for Italy, finally resigned his command. On the 22nd of May, the son of a few legible men, the rest of his force returning to Italy. The effects of this were soon felt. A force of Tuscan volunteers was attacked by a superior body of Austrians at Curtatone and Montanaro and defeated after a gallant resistance on the 27th of May; Charles Albert, after wasting precious time round Peschiera, which capitulated on the 30th of May, defeated Radetzky at Goito. But the withdrawal of the Neapolitans left Durando too weak to intercept Nugent and his 30,000 men; and the latter, although harassed by the inhabitants of Venetia and repulsed at Vicenza, succeeded in joining Radetzky, who was soon further reinforced from Tirol. The whole Austrian army now turned on Vicenza, which after a brave resistance surrendered on the 10th of June. All Venetia except the capital was thus once more occupied by the Austrians. On the 23rd, 24th and 25th of July (first battle of Custozza) the Piedmontese were defeated and forced to retire on Milan with Radetzky's superior force in pursuit. The king was the object of a hostile demonstration in Milan, and although he was ready to defend the city to the last, the town council negotiated a capitulation with Radetzky. The mob, egged on by the republicans, attacked the palace where the king was lodged, and he escaped with difficulty, returning to Piedmont with the remnants of his army.

The death of August Radetzky re-entered Milan, and three days later an armistice was concluded between Austria and Piedmont, the latter agreeing to evacuate Lombardy and Venetia. The offer of French assistance, made after the proclamation of the republic in the spring of 1848, had been rejected mainly because France, fearing that the creation of a strong Italian state would be a danger to her, would have demanded the cession of Nice and Savoy, which the king refused to consider.

Meanwhile, the republic had been proclaimed in Venice; but on the 7th of July the assembly declared in favour of fusion with Piedmont, and Manin, who had been elected president, resigned his powers to the royal commissioners. Soon after Custozza, however, the Austrians blockaded the city on the land side. In Rome the pope's authority weakened day by day, and disorder increased. The Austrian attempt to occupy Bologna was repulsed by the citizens, but unfortunately this success was followed by anarchy and murder, and Farini only with difficulty restored a semblance of order. The Mamiani ministry having failed to achieve anything, Pius summoned Pellegrino Rossi, a learned lawyer who had long been exiled in France, to form a cabinet. On the 15th of November he was assassinated, and as no one was punished for this crime the insolence of the disorderly elements increased, and shots were exchanged with the Swiss Guard. The terrified pope fled in disguise to Gaeta (November 25), and when parliament requested him to return he refused even to receive the deputation. This meant a complete rupture; on the 5th of February 1849 a constituent assembly was summoned, and on the 9th it voted the downfall of the temporal power and proclaimed the republic. Mazzini hurried to Rome to see his dream realized, and was chosen head of the Triumvirate. On the 18th Pius invited the armed intervention of France, Austria, Naples and Spain to restore his authority. In Tuscany the government drifted from the moderates to the extreme democrats; the Ridolfi ministry was succeeded after Custozza by that of Ricasoli, and the latter by that of Capponi. The lower classes provoked disorders, which were very serious at Leghorn, and were only quelled by Guzzarri's energy. Capponi resigned in October 1848, and Leopold reluctantly consented to a democratic ministry led by Guzzarri and Montanelli, the former a very ambitious and unscrupulous man, the latter honest but fantastic. Following the Roman example, a constituent assembly was demanded to vote on union with Rome and eventually with the rest of Italy. The grand-duke, fearing an excommunication from the pope, refused the request, and left Florence for Siena and
S. Stefano; on the 8th of February 1849 the republic was proclaimed, and on the 21st, at the pressing request of the pope and the king of Naples, Leopold went to Gaeta.

Ferdinand did not openly break his constitutional promises until Sicily was reconquered. His troops had captured Messina after a bombardment which earned him the sobriquet of "King Bomba"; Catania and Syracuse fell soon after, hideous atrocities being everywhere committed with his sanction. He now proscribed parliament, adopted stringent measures against the Liberals, and retired to Gaeta, the haven of refuge for deposed despots.

But so long as Piedmont was not completely crushed none of the princes dared to take decisive measures against their subjects; in spite of Custozza, Charles Albert still had an army, and Austria, with revolutions in Vienna, Hungary and Bohemia on her hands, could not intervene. In Piedmont the Pinelli-Reveli ministry, which had continued the negotiations for an alliance with Leopold and the pope, resigned as it could not count on a parliamentary majority, and in December the returned exile Gioberti formed a new ministry. His proposal to reinstate Leopold and the pope with Piedmontese arms, so as to avoid Austrian intervention, was rejected by both potentates, and met with opposition even in Piedmont, which would thereby have forfeited its prestige throughout Italy. Austrian mediation was now imminent, as the Vienna revolution had been crushed, and the new emperor, Francis Joseph, refused to consider any settlement other than on the basis of the treaties of 1815. But Charles Albert, who, whatever his faults, had a generous nature, was determined that so long as he had an army in being he could not abandon the Lombards and the Venetians, whom he had encouraged in their resistance, without one more effort, though he knew full well that he was staking all on a desperate chance. On the 18th of March 1849, he denounced the armistice, and, owing to the want of confidence in Piedmontese strategy after 1848, gave the chief command to the Polish General Chrzanski. His forces amounted to 80,000 men, including a Lombard corps and some Roman, Tuscan and other volunteers. But the discipline and moral of the army were shaken and its organization faulty. General Ramorino, disobeying his instructions, failed to prevent corps of Austrians under Lieut. Field-Marshal d'Aspre from seizing Mortara, a fault for which he was afterwards court-martialled and shot, and after some preliminary fighting Radetzky won the decisive battle of Novara (March 25) which broke up the Piedmontese army. The king, who had sought death in vain all day, had to ask terms of Radetzky; the latter demanded a slice of Piedmont and the heir to the throne (Vctor Emmanuel II) as a hostage, without a reservation for the consent of parliament. Charles Albert, realizing his own failure and thinking that his son might obtain better terms, abdicated and departed at once for Portugal, where he died in a monastery a few months later. Victor Emmanuel went in person to treat with Radetzky on the 24th of March. The Field-Marshal received him most courteously and offered not only to waive the demand for a part of Piedmontese territory, but to enlarge the kingdom, on condition that the constitution should be abolished and the blue Piedmontese flag substituted for the tricolor. But the young king was determined to abide by his father's oath, and had therefore to agree to an Austrian occupation of the territory between the Po, the Ticino and the Sesia, and of half the cindia of Alessandria, until peace should be concluded, the evacuation of all districts occupied by his troops outside Piedmont, the dissolution of his corps of Lombard, Polish and Hungarian volunteers and the withdrawal of his fleet from the Adriatic.

Novara set Austria free to reinstate the Italian despots. Ferdinand at once re-established autocracy in Naples; though the struggle in Sicily did not end until May, when Palermo, after a splendid resistance, capitulated. In Tuscany disorder continued, and although Guerazzi, who had been appointed dictator, saved the country from complete anarchy, a large part of the population, especially among the peasantry, was still loyal to the grand-duke. After Novara the chief question was how to avoid an Austrian occupation, and owing to the prevailing confusion the town council of Florence took matters into its own hands and declared the grand-duke reinstated, but on a constitutional basis and without foreign help (April 12). Leopold accepted as regards the constitution, but said nothing about foreign intervention. Count Serrius, the grand-ducal commissioner, arrived in Florence on the 4th of May 1849; the national guard was disbanded; and on the 25th, the Austrians under d'Aspre entered Florence.

On the 28th of July Leopold returned to his capital, and while that event was welcomed by a part of the people, the fact that he had come under Austrian protection ended by destroying all loyalty to the dynasty, and consequently contributed not a little to Italian unity.

In Rome the triumvirate decided to defend the republic to the last. The city was quieter and more orderly than it had ever been before, for Mazzini and Ciceruacchio successfully opposed all class warfare; and in April the defenders received a priceless addition to their strength in the person of Garibaldi, who, on the outbreak of the revolution in 1848, had returned with a few of his followers from his exile in South America, and in April 1849 entered Rome with some 500 men to fight for the republic. At this time France, as a counterpoise to Austrian intervention in other parts of Italy, decided to restore the pope, regardless of the fact that this action would necessitate the crushing of a sister republic. As yet, however, no such intention was publicly avowed. On the 25th of April General Oudinot landed with 8000 men at Civitavecchia, and on the 30th attempted to capture Rome by surprise, but was completely defeated by Garibaldi, who might have driven the French into the sea, had Mazzini allowed him to leave the city. The French republican government, in order to gain time for reinforcements to arrive, sent Ferdinand de Lesseps to pretend to treat with Mazzini, the envoy himself not being a party to this deception. Mazzini refused to allow the French into the city, but while the negotiations were being dragged on Oudinot's force was increased to 35,000 men. At the same time an Austrian army was marching through the Legations, and Neapolitan and Spanish troops were advancing from the south. The Roman army (20,000 men) was commanded by General Rosselli, and included, besides Garibaldi's red-shirted legionaries, volunteers from all parts of Italy, mostly very young men, many of them wealthy and of noble family. The Neapolitans were ignominiously beaten in May and retired to the frontier; on the 1st of June Oudinot declared that he would attack Rome on the 4th, but by beginning operations on the 3rd, when no attack was expected, he captured an important position in the Pamphili gardens.

In spite of this success, however, it was not until the end of the month, and after desperate fighting, that the French penetrated within the walls and the defence ceased (June 29). The Assembly, which had continued in session, was dispersed by the French troops on the 2nd of July, but Mazzini escaped a week later. Garibaldi quitted the city, followed by 4000 of his men, and attempted to join the defenders of Venice. In spite of the fact that he was pursued by the armies of four Powers, he succeeded in reaching San Marino; but his force melted away and, after hiding in the marshes of Ravenna, he fled across the peninsula, assisted by nobles, peasants and priests, to the Tuscan coast, whence he reached Piedmont and eventually America, to await a new call to fight for Italy (see GARIBALDI).

After a heroic defence, conducted by Giuseppe Martinengo, Brescia was recaptured in April by the Austrians under Lieut. Field-Marshal von Haynau, the atrocities which followed earning for Haynau the name of "The Hyena of Brescia." In May they seized Bologna, and Ancona in June, restoring order in those towns by the same methods as at Brescia. Venice alone still held out; after Novara the Piedmontese commissioners withdrew and Manin again took charge of the government. The assembly
voted: "Venice resists the Austrians at all costs," and the citizens and soldiers, strengthened by the arrival of volunteers from all parts of Italy, including Pepe, who was given the chief command of the defenders, showed the most splendid devotion in their hopeless task. By the end of May the city was blockaded by land and sea, and in July the bombardment began. On the 24th the city, reduced by famine, capitulated on favourable terms. Manin, Pepe and a few others were excluded from the amnesty and went into exile.

Thus were despotism and foreign predominance re-established throughout Italy. Yet the "terrible year" was by no means all loss. The Italian cause had been crushed, but revolution and war had strengthened the feeling of unity, for Neapolitans had fought for Venice, Lombards for Rome. Piedmontese for all Italy. Piedmont was shown to possess the qualities necessary to constitute the nucleus of a great nation. It was now evident that the federal idea was impossible, for none of the princes except Victor Emmanuel could be trusted, and that unity and freedom could not be achieved under a republic, for nothing could be done without the Piedmontese army, which was royalist to the core. All reasonable men were now convinced that the question of the ultimate form of the Italian government was secondary, and that the national efforts should be concentrated on the task of expelling the Austrians; the form of government could be decided afterwards. Liberals were by no means inclined to despair of accomplishing this task; for hatred of the foreigners, and of the despots restored by their bayonets, had been deepened by the humiliations and cruelties suffered during the war into a passion common to all Italy.

When the terms of the Austro-Piedmontese armistice were announced in the Chamber at Turin they aroused great indignation, but the king succeeded in convincing the deputies that they were inevitable. The peace negotiations dragged on for several months, involving two changes of ministry, and D'Azeglio became premier. Through Anglo-French mediation Piedmont's war indemnity was reduced from 350,000,000 to 75,000,000 lire, but the question of the amnesty remained. The king declared himself ready to go to war again if those compromised in the Lombard revolution were not freely pardoned, and at last Austria agreed to amnesty all save a very few, and in August the peace terms were agreed upon. The Chamber, however, refused to ratify them, and it was not until the king's eloquent appeal from Moncalieri to his people's loyalty, and after a dissolution and the election of a new parliament, that the treaty was ratified (January 9, 1850). The situation in Piedmont was far from promising, the exchequer was empty, the army disorganized, the country despondent and suspicious of the king. If Piedmont was to be fitted for the part which optimists expected it to play, everything must be built up anew. Legislation had to be entirely reformed, and the bill for abolishing the special jurisdiction for the clergy (foro ecclesiastico) and other medial privileges aroused the bitter opposition of the Vatican as well as of the Piedmontese clerics. This suited Cavour, who had been in parliament for some time and had in his speech of the 7th of March struck the first note of encouragement after the gloom of Novara, became minister of agriculture, and in 1851 also assumed the portfolio of finance. He ended by dominating the cabinet, but owing to his having negotiated a union of the Right Centre and the Left Centre (the Consobrio) in the conviction that both parties needed the moderate elements of both parties, he quarrelled with D'Azeglio (who, as an uncompromising conservative, failed to see the value of such a move) and resigned. But D'Azeglio was not equal to the situation, and he, too, resigned in November 1852; whereupon the king appointed Cavour prime minister, a position which with short intervals he held until his death.

The Austrians in the period from 1849 to 1850, known as the decennio della resistenza (decade of resistance), were made to feel that they were in a conquered country where they could have no social intercourse with the people; for no self-respecting Lombard or Venetian would even speak to an Austrian. Austria, on the other hand, treated her Italian subjects with great severity. The Italian provinces were the most heavily taxed in the whole empire, and much of the money thus levied was spent either for the benefit of other provinces or to pay for the huge army of occupation and the fortresses in Italy. The promise of a constitution for the empire, made in 1849, was never carried out; the government of Lombardo-Venetia was vested in Field-Marshal Radetzky; and although only very few of the revolutionists were excluded from the amnesty, the carrying of arms or the distribution or possession of revolutionary literature was punished with death. Long terms of imprisonment and the bastinado, the latter even inflicted on women, were the penalties for the least expression of anti-Austrian opinion.

The Lombard republicans had been greatly weakened by the events of 1848; but Mazzini still believed that a bold act by a few revolutionists would make the people rise en masse and expel the Austrians. A conspiracy, planned with the object, among others, of kidnapping the emperor while on a visit to Venice and forcing him to make concessions, was postponed in consequence of the coup d'état by which Louis Napoleon became emperor of the French (1852); but a chance discovery led to a large number of arrests, and the state trials at Mantua, conducted in the most shamelessly inquisitorial manner, resulted in five death sentences, including that of the priest Tazzoli, and many of imprisonment for long terms. Even this did not convince Mazzini of the hopelessness of such attempts, for he was out of touch with Italian public opinion, and he greatly weakened his influence by favouring a crack-brained outbreak at Milan on the 6th of February 1853, which was easily quelled, numbers of the insurgents being executed or imprisoned. Radetzky, not satisfied with this, laid an embargo on the property of many Lombard emigrants who had settled in Piedmont and become naturalized, accusing them of complicity. The Piedmontese government rightly regarded this measure as a violation of the peace treaty of 1850, and Cavour recalled the Piedmontese minister from Vienna, an action which was endorsed by Italian public opinion generally, and won the approval of France and England.

Cavour's ideal for the present was the expulsion of Austria from Italy and the expansion of Piedmont into a north Italian kingdom; and, although he did not yet think of Italian unity as a question of practical policy, he began to foresee it as a future possibility. But in reorganizing the shattered finances of the state and preparing it for its greater destinies, he had to impose heavy taxes, which led to rioting and involved the minister himself in considerable though temporary unpopularity. His ecclesiastical legislation, too, met with bitter opposition from the Church.

But the question was soon forgotten in the turmoil caused by the Crimean War. Cavour believed that by taking part in the war his country would gain for itself a military status and a place in the councils of the great Powers, and establish claims on Great Britain and France for the recognition of its Italian ambitions. One section of public opinion desired to make Piedmont's co-operation subject to definite promises by the Powers; but the latter refused to bind themselves, and both Victor Emmanuel and Cavour realized that, even without such promises, participation would give Piedmont a claim. There was also the danger that Austria might join the allies first and Piedmont be left isolated; but there were also strong arguments on the other side, for while the Radical party saw no obvious reason why Piedmont should fight other people's battles, and therefore opposed the alliance, there was the risk that Austria might join the alliance together with Piedmont, which would have constituted a disastrous situation. Da Bormida, the minister for foreign affairs, resigned rather than agree to the proposal, and other statesmen were equally opposed to it. But after long negotiations the treaty of alliance was signed in January 1855, and while Austria remained neutral, a well-equipped Piedmontese force of 15,000 men, under General La Marmora, sailed for the Crimea. Everything turned out as Cavour had hoped.
The Piedmontese troops distinguished themselves in the field, gaining the sympathies of the French and English; and at the subsequent congress of Paris (1856), where Cavour himself was Sardinian representative, the Italian question was discussed, and the intolerable oppression of the Italian peoples by Austria and the despotism ventilated.

Austria at last began to see that a policy of coercion was useless and dangerous, and made tentative efforts at conciliation. Taxation was somewhat reduced, the censorship was made less severe, political amenities were granted, humaner officials were appointed and the Congregations (a sort of shadowy consultative assembly) were revived. In 1856 the emperor and empress visited their Italian dominions, but were received with icy coldness; the following year, on the retirement of Radetzky at the age of ninety-three, the archduke Maximilian, an able, cultivated and kind-hearted man, was appointed viceroy. He made desperate efforts to conciliate the population, and succeeded with a few of the nobles who were led to believe in the possibility of an Italian confederation, including Lombardy and Venetia which would be united to Austria by a personal union alone; but the immense majority of all classes rejected these advances, and came to regard union with Piedmont with increasing favour.¹

Meanwhile Francis V. of Modena, restored to his duchy by Austrian bayonets, continued to govern according to the traditions of his house. Charles II. of Parma, after having been reinstated by the Austrians, abdicated in favour of his son Charles III. a drunken libertine and a cruel tyrant (May 1849); the latter was assassinated in 1849, and a regency under his widow, Marie Louise, was instituted during which the government became somewhat more tolerable, although by no means free from political persecution; in 1857 the Austrian troops evacuated the duchy. Leopold of Tuscany suspended the constitution, and in 1852 formally abolished it by order from Vienna; he also concluded a treaty of semi-subjection with Austria and a Concordat with the pope for granting fresh privileges to the Church. His government, however, was not characterized by cruelty like those of his brother despots, and Guerraelli and the other Liberals of 1849, although tried and sentenced to long terms of imprisonment, were merely exiled. Yet the opposition gained recruits among all the abler and most respectable Tuscans. In Rome, after the restoration of the temporal power by the French troops, the pope paid no attention to Louis Napoleon's advice to maintain some form of constitution, to grant a general amnesty, and to secularize the administration. He promised, indeed, a consultative council of state, and granted an amnesty from which no less than 25,000 persons were excluded; but on his return to Rome (19th April 1850), after it was quite certain that France had given up all idea of imposing constitutional limitations on him, he re-established his government on the old lines of priestly absolutism, and, devoting himself to religious practices, left political affairs mostly to the astute cardinal Antonelli, who repressed with great severity the political agitation which still continued. At Naples a trialist disturbance in September 1849, led to the arrest of a large number of persons connected with the Carbonari. The prisoners included Silvio Spaventa, Luigi Settembrini, Carlo Poero and many other cultured and worthy citizens. Many condemnations followed, and hundreds of "politics" were immersed in hideous dungeons, a state of things which provoked Gladstone's famous letters to Lord Aberdeen, in which Bourbon rule was branded for all time as "the nearest one to anarchy in a system of government." But oppressive, corrupt and inefficient as it was, the government was not confronted by the uncompromising hostility of the whole people; the ignorant priest-ridden masses were either indifferent or of mildly Bourbon sympathies; the opposition was constituted by the educated middle classes and a part of the nobility. The revolutionary attempts of Bentivegna in Sicily (1856) and of the Mazzinian Carlo Pisacane, who landed at Sapri in Calabria with a few followers in 1857, failed from lack of popular support, and the leaders were killed.

The decline of Mazzini's influence was accompanied by the rise of a new movement in favour of Italian unity under Victor Emmanuel, inspired by the Milanese marquis Giorgio Pallavicini, who had spent 14 years in the Sibbeig, and by Manin, living in exile in Paris, both of them ex-republicans who had become monarchists. The propaganda was organized by the Sicilian La Farina by means of the Societé Nazionale. All who accepted the motto "Unity, Independence and Victor Emmanuel" were admitted into the society. Many of the republicans and Mazzinians joined it, but Mazzini himself regarded it with no sympathy. In the Austrian provinces and in the duchies it carried all before it, and gained many adherents in the Legations, Rome and Naples, although in the latter regions the autonomist feeling was still strong even among the Liberals. In Piedmont itself it was at first less successful; and Cavour, although he aspired ultimately to a united Italy with Rome as the capital,² openly professed no ambition beyond the expulsion of Austria and the formation of a North Italian kingdom. But he gave secret encouragement to the movement, and ended by practically directing its activity through La Farina. The king, too, was in close sympathy with the society's aims, but for the present it was necessary to hide this attitude from the eyes of the Powers, whose sympathy Cavour could only hope to gain by professing hostility to everything that savoured of revolution. Both the king and his minister realized that Piedmont alone, even with the help of the National Society, could not expel Austria from Italy without foreign assistance. Piedmontese finances had been strained to breaking-point to organize an army obviously intended for other than merely defensive purposes. Cavour now set himself to the task of isolating Austria and securing an alliance for her expulsion. A British alliance would have been preferable, but the British government was too much concerned with the preservation of European peace. The emperor Napoleon, almost alone among Frenchmen, had genuine Italian sympathies. But were he to intervene in Italy, the intervention would not only have to be successful; it would have to bring tangible advantages to France. Hence his hesitations and vacillations, which Cavour steadily worked to overcome. Suddenly on the 14th of January 1858 Napoleon's life was attempted by Felice Orsini (q.v.) a Mazzinian Romagnol, who believed that Napoleon was the chief obstacle to the success of the revolution in Italy. The attempt failed and its author was caught and executed, but while it appeared at first to destroy Napoleon's Italian sympathies and led to a sharp interchange of notes between Paris and Turin, the emperor was really impressed by the attempt and by Orsini's letter from prison exhorting him to intervene in Italy. He realized how deep the Italian feeling for independence must be, and that a refusal to act now might result in further attempts on his life, as indeed Orsini's letter stated. Consequently negotiations with Cavour were resumed, and a meeting with him was arranged to take place at Plombières (20th and 21st of July 1858). There it was agreed that France should supply 200,000 men and Piedmont 100,000 for the expulsion of the Austrians from Italy, that Piedmont should be expanded into a kingdom of North Italy, that central Italy should form a separate kingdom, on the throne of which the emperor contemplated placing one of his own relatives, and that Napoleon would, probably under Louis Napoleon, or the pope, while retaining only the "Patriarchate of St Peter" (the Roman province) should be president of the Italian confederation. In exchange for French assistance Piedmont would cede Savoy and perhaps Nice to France; and a marriage between Victor Emmanuel's daughter Clothilde and Jerome Bonaparte, to which Napoleon attached great importance, although not made a definite condition, was also discussed. No written agreement, however, was signed.

¹ The popular cry of "Viva Verdi!" did not merely express enthusiasm for Italy's most eminent musician, but signified, in initials: "Viva Vittorio Emanuele Re d'Italia!"

² La Farina's Epistolario, ii. 426.
On the 1st of January 1859, Napoleon astounded the diplomatic world by remarking to Baron Hübner, the Austrian ambassador, at the New Year's reception at the Tuileries, that he regretted that relations between France and Austria were "not so good as they had been"; and at the opening of the Piedmontese parliament on the 10th Victor Emmanuel pronounced the memorable words that he could not be insensible to the cry of pain (il grido di dolore) which reached him from all parts of Italy. Yet after these warlike declarations and after the signing of a military convention at Turin, the king agreeing to all the conditions proposed by Napoleon, the latter suddenly became pacific again, and adopted the Russian suggestion that Italian affairs should be settled by a congress. Austria agreed on condition that Piedmont should disarm and should not be admitted to the congress. Lord Malmesbury urged the Sardinian government to yield; but Cavour refused to disarm, or to accept the principle of a congress, unless Piedmont were admitted to it on equal terms with the other Powers. As neither the Sardinian nor the Austrian government seemed disposed to yield, the idea of a congress had to be abandoned. Lord Malmesbury now proposed that all three Powers should disarm simultaneously and that, as suggested by Austria, the precedent of Laibach should be followed and all the Italian states invited to plead their cause at the bar of the Great Powers. To this course Napoleon consented, to the despair of King Victor Emmanuel and Cavour, who saw in this a proof that he wished to back out of his engagement and make war impossible. When war seemed imminent volunteers from all parts of Italy, especially from Lombardy, had come pouring into Piedmont to enrol themselves in the army or in the specially raised volunteer corps (the command of which was given to Garibaldi), and to "go to Piedmont" became a test of patriotism throughout the country. Urged by a peremptory message from Napoleon, Cavour saw the necessity of bowing to the will of Europe, of disbanding the volunteers and reducing the army of Piedmont. The situation, however, was saved by a false move on the part of Austria. At Vienna the war party was in the ascendancy; the convention for disarmament had been signed, but so far from its being carried out, the reserves were actually called out on the 12th of April; and on the 23rd, before Cavour's decision was known at Vienna, an Austrian ultimatum reached Turin, summoning Piedmont to disarm within three days on pain of invasion. Cavour was filled with joy at the turn affairs had taken, for Austria now appeared as the aggressor. On the 20th Francis Joseph declared war, and the next day his troops crossed the Ticino, a move which was followed, as Napoleon had stated it would be, by a French declaration of war. The military events of the Italian war of 1859 are described under ITALIAN WARS. The actions of Montebello (May 20), Palestrina (May 31) and Melegnano (June 8) and the battles of Magenta (June 4) and Solferino (June 24) all went against the Austrians. Garibaldi's volunteers raised the standard of insurrection and held the field in the region of the Italian lakes. After Solferino the allies prepared to besiege the Quadrilateral. Then Napoleon suddenly drew back, unwilling, for many reasons, to continue the campaign. Firstly, he doubted whether the allies were strong enough to attack the Quadrilateral, for he saw the defects of his own army's organization; secondly, he began to fear intervention by Prussia, whose attitude appeared menacing; thirdly, although really anxious to expel the Austrians from Italy, he did not wish to create a too powerful Italian state at the foot of the Alps, which, besides constituting a potential danger to France, might threaten the pope's temporal power, and Napoleon believed that he could not stand without the clerical vote; fourthly, the war had been declared against the wishes of the great majority of Frenchmen and was even now far from popular. Consequently, to the surprise of all Europe, while the allied forces were drawn up ready for battle, Napoleon, without consulting Victor Emmanuel, sent General Fleury on the 6th of July to Francis Joseph to ask for an armistice, which was agreed to. The king was now informed, and on the 8th Generals Vaillant, Della Rocca and Hess met at Villafranca and arranged an armistice until the 15th of August. But the king and Cavour were terribly upset by this move, which meant peace without Venetia; Cavour hurried to the king's headquarters at Monzambano and in excited, almost disrespectful, language implored him not to agree to peace and to continue the war alone, relying on the Piedmontese army and a general Italian revolution. But Victor Emmanuel on this occasion proved the greater statesman of the two; he understood that, hard as it was, he must content himself with Lombardy for the present, lest all be lost. On the 11th the two emperors met at Villafranca, where they agreed that Lombardy should be ceded to Piedmont, and Venetia retained by Austria but governed by Liberal methods; that the rulers of Tuscany, Parma and Modena, who had been again deposed, should be restored, the Papal States reformed, the Legations given a separate administration and the pope made president of an Italian confederation including Austria as mistress of Venetia. It was a revival of the old impossible federal idea, which would have left Italy divided and dominated by Austria and France. Victor Emmanuel regretfully signed the peace preliminaries, adding, however, pour ce qui me concerne (which meant that he made no undertaking with regard to central Italy), and Cavour resigned office.

The Lombard campaign had produced important effects throughout the rest of Italy. The Sardinian government had formally invited that of Tuscany to participate in the war of liberation, and on the grand-duke rejecting the proposal, moderates and democrats combined to present an ultimatum to Leopold demanding that he should abdicate in favour of his son, grant a constitution and take part in the campaign. On his refusal Florence rose as one man, and he, feeling that he could not rely on his troops, abandoned Tuscany on the 27th of April 1859. A provisional government was formed, led by Ubaldo Peruzzi, and was strengthened on the 8th of May by the inclusion of Baron Bettino Ricasoli, a man of great force of character, who became the real head of the administration, and all through the ensuing critical period aimed unwaveringly at Italian unity. Victor Emmanuel, at the request of the people, assumed the protectorate over Tuscany, where he was represented by the Sardinian minister Boncompagni. On the 23rd of May Prince Napoleon, with a French army corps, landed at Leghorn, his avowed object being to threaten the Austrian flank; and in June these troops, together with a Tuscan contingent, departed for Lombardy. In the duchy of Modena an insurrection had broken out, and after Magenta Duke Francis joined the Austrian army in Lombardy, leaving a regency in charge. But on the 14th of June the municipality formed a provisional government and proclaimed annexation to Piedmont; L. C. Farini was chosen dictator, and 4000 Modenese joined the allies. The duchy of Parma also withdrew to Austrian territory, and on the 11th of June annexation to Piedmont was proclaimed. At the same time the Austrians evacuated the Legations and the Maresi, the papal representative, departed. The municipality of Bologna formed a Giunta, to which Romagna and the Marches adhered, and invoked the dictatorship of Victor Emmanuel; at Perugia, too, a provisional government was constituted under F. Guardabassi. But the Marches were soon reoccupied by pontifical troops, and Perugia fell, its capture being followed by an indiscriminate massacre of men, women and children. In July the marquis D'Azeglio arrived at Bologna as royal commissioner.

After the meetings at Villafranca Napoleon returned to France. The question of the cession of Nice and Savoy had not been raised; for the emperor had not fulfilled his part of the bargain, that he would drive the Austrians out of Italy, since Venice was yet to be freed. At the same time he was resolutely opposed to the Piedmontese annexations in central Italy. But here Cavour intervened, for he was determined to maintain the annexations, at all costs. Although he had resigned, he remained
in office until Rattazzi could form a new ministry; and while officially recalling the royal commissioners according to the preliminaries of Villafranca, he privately encouraged them to remain and organize resistance to the return of the despot, if necessary by force (see Cavour). Farini, who in August was elected dictator of Parma as well as Modena, and Ricasoli, who, since, on the withdrawal of the Sardinian commissioner Boncompagni, had become supreme in Tuscany, were now the men who by their energy and determination achieved the annexation of central Italy to Piedmont, in spite of the strenuous opposition of the French emperor and the weakness of many Italian Liberals.

In August Marco Minghetti succeeded in forming a military league and a customs union between Tuscany, Romagna and the duchies, and in procuring the adoption of the Piedmontese codes; and envos were sent to Paris to mollify Napoleon. Constituent assemblies met and voted for unity under Victor Emmanuel, but the king could not openly accept the proposal owing to the emperor's opposition, backed by the presence of French armies in Lombardy; at a word from Napoleon there might have been an Austrian, and perhaps a Franco-Austrian, invasion of central Italy. But to Napoleon's statement that he could not agree to the unification of Italy, as he was bound by his promises to Austria at Villafranca, Victor Emmanuel replied that he himself, after Magenta and Solferino, was bound in honour to link his fate with that of the Italian people; and General Manfredo Fanti was sent by the Turin government to organize the army of the Central League, with Garibaldi under him.

The terms of the treaty of peace signed at Zürich on the 10th of November were practically identical with those of the preliminaries of Villafranca. It was soon evident, however, that the Italian question was far from being settled. Central Italy refused to be bound by the treaty, and offered the dictatorship to Prince Carignano, who, himself unable to accept owing to Napoleon's opposition, suggested Boncompagni, who was accordingly elected. Napoleon now realized that it would be impossible, without running serious risks, to oppose the movement in favour of unity. He suggested an international congress on the question; inspired a pamphlet, Le Pape et le Congrés, which proposed a reduction of the papal territory, and wrote to the pope urging him to cede Romagna in order to obtain better guarantees for the rest of his dominions. The proposed congress fell through, and Napoleon thereupon raised the question of the cession of Nice and Savoy as the price of his consent to the union of the central provinces with the Italian kingdom. In January 1866 the Rattazzi ministry fell, after completing the fusion of Lombardy with Piedmont, and Cavour was again summoned by the king to the head of affairs.

Cavour well knew the unpopularity that would fall upon him by consenting to the cession of Nice, the birthplace of Garibaldi, and Savoy, the cradle of the royal house; but he realized the necessity of the sacrifice, if central Italy was to be won. The negotiations were long drawn out; for Cavour struggled to save Nice and Napoleon was anxious to make conditions, especially as regards Tuscany. At last, on the 24th of March, the treaty was signed whereby the cession was agreed upon, but subject to the vote of the populations concerned and ratification by the Italian parliament. The king having formally accepted the volume of territory ceded, Tuscany and Romagna, Napoleon appointed the prince of Carignano viceroy with Ricasoli as governor-general (22nd of March), and was immediately afterwards communicated by the pope. On the 2nd of April 1860 the new Italian parliament, including members from central Italy, assembled at Turin. Three weeks later the treaty of Turin ceding Savoy and Nice to France was ratified, though not without much opposition, and Cavour was fiercely reviled for his share in the transaction, especially by Garibaldi, who even contemplated an expedition to Nice, but was induced to desist by the king.

In May 1859 Ferdinand of Naples was succeeded by his son Francis II., who gave no signs of any intention to change his father's policy, and, in spite of Napoleon's advice, refused to grant a constitution or to enter into an alliance with Sardinia. The result was a revolutionary agitation which in Sicily, stirred up by Mazzini's agents, Rosalino Pilo and Francesco Crispi, culminated, on the 5th of April 1860, in open revolt. An invitation had been sent Garibaldi to put himself at the head of the movement; at first he had refused, but reports of the progress of the insurrection soon determined him to risk all on a bold stroke, and on the 5th of May he embarked at Quarto, near Genoa, with Bixio, the Hungarian Türr and some 1000 picked followers, on two steamers. The preparations for the expedition, openly made, were viewed by Cavour with mixed feelings. With its object he sympathized; yet he could not give official sanction to an armed attack on a friendly power, nor on the other hand could he forbid an action enthusiastically approved by public opinion. He accordingly directed the Sardinian admiral Persano only to arrest the expedition should it touch at a Sardinian port; while in reply to the indignant protests of the continental powers he dismissed all knowledge of the affair. On the 11th Garibaldi landed at Marsala, without opposition, defeated the Neapolitan forces at Calatafimi on the 15th and entered Palermo in triumph, where he proclaimed himself, in King Victor Emmanuel's name, dictator of Sicily. By the end of July, after the hard-won victory of Milazzo, the whole island, with the exception of the citadel of Messina and a few unimportant ports, was in his hands.

From Cavour's point of view, the situation was now one of extreme anxiety. It was certain that, his work in Sicily done, Garibaldi would turn his attention to the Neapolitan dominions on the mainland; and beyond these lay Umbria and the Marches and—Rome. It was all-important that whatever victories Garibaldi might win should be won for the Italian kingdom, and, above all, that no ill-timed attack on the Papal States should provoke an intervention of the powers. La Farina was accordingly sent to Palermo to urge the immediate annexation of Sicily to Piedmont. But Garibaldi, who wished to keep a free hand, distrusted Cavour and scorned all counsels of expediency, refused to agree; Sicily was the necessary base for his projected invasion of Naples; it would be time enough to announce its union with Piedmont when Victor Emmanuel had been proclaimed king of United Italy in Rome. Foiled by the dictator's stubbornness, Cavour had once more to take to underhand methods; and, while continuing futile negotiations with King Francis, sent his agents into Naples to stir up disaffection and create a sentiment in favour of national unity strong enough, in any event, to force Garibaldi's hand.

On the 8th of August, in spite of the protests and threats of most of the powers, the Garibaldians began to cross the Straits, and in a short time 20,000 of them were on the mainland. The Bourbonists in Calabria, utterly disorganized, broke before the invincible red-shirts, and the 40,000 men defending the Salerno-Avellino line made no better resistance, being eventually ordered to fall back on the Volturro. On the 6th of September King Francis, with his family and several of the ministers, sailed for Gaeta, and the next day Garibaldi entered Naples alone in advance of the army, and was enthusiastically welcomed. He proclaimed himself dictator of the kingdom, with Bertani as secretary of state, and as proof of his loyalty he consigned the Neapolitan fleet to Persano.

His rapid success, meanwhile, inspired both the French emperor and the government of Turin with misgivings. There was a danger that Garibaldi's entourage, composed of ex-Mazzinians, might induce him to proclaim a republic and march on Rome; which would have meant French intervention and the undoing of all Cavour's work. King Victor Emmanuel and Cavour both wrote to Garibaldi urging him not to spoil all by aiming at too much. But Garibaldi poured scorn on all suggestions of compromise; and Cavour saw that the situation could only be saved by the armed participation of Piedmont in the liberation of south Italy.
The situation was, indeed, sufficiently critical. The unrest in Naples had spread into Umbria and the Marches, and the papal troops, under General Lamoricière, were preparing to suppress it. Had they succeeded, the position of the Piedmontese in Romagna would have been imperilled; had they failed, the road would have been open for Garibaldi to march on Rome. In the circumstances, Cavour decided that Piedmont must anticipate Garibaldi, occupy Umbrìa and the Marches, and place Italy between the red-shirts and Rome. His excuse was the pope's refusal to dismiss his foreign levies (September 7). On the 11th of September a Piedmontese army of 35,000 men crossed the frontier at La Cattolica; on the 18th the pontifical army was crushed at Castellidardo; and when, on the 29th, Ancona fell, Umbrìa and the Marches were in the power of Piedmont. On the 15th of October King Victor Emmanuel crossed the Neapolitan border at the head of his troops.

It had been a race between Garibaldi and the Piedmontese. "If we do not arrive at the Volturbo before Garibaldi reaches La Cattolica," Cavour had said, "the monarchy is lost, and Italy will remain in the prison-house of the Revolution." Fortunately for his policy, the red-shirts had encountered a formidable obstacle in the shape of a large army under Garibaldi, which was now encamped on the Volturbo under the guns of Capua. On the 19th of September the Garibaldians began their attack on this position with their usual impetuous valour; but they were repulsed again and again, and it was not till the 2nd of October, after a two days' pitched battle, that they succeeded in carrying the position. The way was now open for the advance of the Piedmontese, who, save at Isernia, encountered practically no resistance. On the 29th Victor Emmanuel and Garibaldi met, and on the 7th of November they entered Naples together. Garibaldi now resigned his authority into the king's hands and, refusing the title and other honours offered to him, retired to his island home of Caprera.1

Gaeta remained still to be taken. The Piedmontese under Cialdini had begun the siege on the 5th of November, but it was not until the 10th of January 1861, when at the instance of Great Britain Napoleon withdrew his squadron, that the blockade could be made complete. On the 13th of February the fortress surrendered. Francis and his family having departed by sea for papal territory. The citadel of this ancient capital was finally taken on the 23rd, and Civitella del Tronto, the last stronghold of Bourbonism, on the 21st of March. On the 18th of February the first Italian parliament met at Turin, and Victor Emmanuel was proclaimed king of Italy. The new kingdom was recognized by Great Britain within a fortnight, by France three months later, and subsequently by other powers. It included the whole peninsula except Venetia and Rome, and these the government and the nation were determined to annex sooner or later.

There were, however, other serious problems calling for immediate attention. The country had to be built up and converted from an agglomeration of scattered medieval principalities into a united modern nation. The first question which arose was that of brigandage in the south. Brigandage had always existed in the Neapolitan kingdom, largely owing to the poverty of the people; but the evil was now aggravated by the mistake of the new government in dismissing the Bourbon troops, and then calling them out again as recruits. A great many turned brigands rather than serve again, and together with the remaining adherents of Bourbon rule and malefactors of all kinds, were made use of by the ex-king and his encourage to harass the Italian administration. Bands of desperadoes were formed, commanded by the most infamous criminals and by foreigners who came to fight in what they were led to believe was an Italian freedom which was in reality a campaign of butchery and plunder. Villages were sacked and burnt, men, women, and children mutilated, tortured or roasted alive, and women outraged. The authors of these deeds when pursued by troops fled into papal territory, where they were welcomed by the authorities and allowed to remain. The fresh recruits under the aegis of the Church. The prime organizers of the movement were King Francis's uncle, the count of Trapani, and Mons. de Mérode, a Belgian eclesiastic who enjoyed immense influence at the Vatican. The task of suppressing brigandage was entrusted to Generals La Marmora and Cialdini; but in spite of extreme severity, justifiable in the circumstances, it took four or five years completely to suppress the movement. Its vitality, indeed, was largely due to the mistakes made by the new administration, conducted, as this was by officials ignorant of southern conditions and out of sympathy with a people far more primitive than in any other part of the peninsula. Politically, its existence was due to the impossibility of allowing the continuance of an independent Roman state in the heart of Italy.

Another of the government's difficulties was the question of what to do with Garibaldi's volunteers. Fanti, the minister of war, had three armies to incorporate in that of Piedmont, viz. that of general Italy, that of the Bourbons and that of Garibaldi. The first caused no difficulty: the rank and file of the second were mostly disbanded, but a number of the officers were taken into the Italian army; the third offered a more serious problem. Garibaldi demanded that all the officers should be given equivalent rank in the Italian army, and in this he had the support of Fanti. Cavour, on the other hand, while anxious to deal generously with the Garibaldians, recognized the impossibility of such a course, which would not only have offended the conservative spirit of the Piedmontese military caste, which disliked and despised irregular troops, but would almost certainly have introduced into the army an element of indiscipline and disorder.

On the 18th of April the question of the volunteers was discussed in one of the most dramatic sittings of the Italian parliament. Garibaldi, elected member for Naples, denounced Cavour in unmeasured terms for his treatment of the volunteers and for the cession of Nice, accusing him of leading the country to civil war. These charges produced a tremendous uproar, but Bixio by a splendid appeal for concord succeeded in calming the two adversaries. On the 23rd of April they were formally reconciled in the presence of the king, but the scene of the 18th of April hastened Cavour's end. In May the Roman question was discussed in parliament. Cavour had often declared that in the end the capital of Italy must be Rome, for it alone of all Italian cities had an unquestioned claim to moral supremacy, and his views of a free church in a free state were well known. He had negotiated secretly with the pope through unofficial agents, and sketched out a scheme of settlement of the Roman question, which foreshadowed in its main features the law of papal guarantees. But it was not given him to see this problem solved, for his health was broken by the strain of the last few years, during which practically the whole administration of the country was concentrated in his hands. He died after a short illness on the 6th of June 1861, at a moment when Italy had the greatest need of his statesmanship.

Ricasoli now became prime minister, Cavour having advised the king to that effect. The financial situation was far from brilliant, for the expenses of the administration of Italy were far larger than the total of those of all the separate states, and everything had to be created or rebuilt. The budget of 1861 showed a deficit of 344,000,000 lire, while the service of the debt was 110,000,000; deficits were met by new loans issued on unfavourable terms (that of July 1861 for 500,000,000 lire cost the government 741,833,000), and government stock fell as low as 36. It was now that the period of reckless finance began which, save for a lucid interval under Sella, was to last until nearly the end of the century. Considering the state of the country and the coming of war for Venice, however, the government might have rendered the situation less dangerous. Ricasoli, honest and capable as he was, failed to win popularity; his attitude on the Roman question, which became more uncompromising after the failure of his attempt at conciliation, and his desire to emancipate Italy from French predominance, brought down on him the hostility of Napoleon. He fell in March 1862, and was succeeded by Rattazzi, who being more pliable and intriguing managed at first to please everybody, including Garibaldi. At this time the extremists and even the moderates were full of schemes for liberating Venice and Rome. Garibaldi had a plan, with which the premier was connected, for attacking Austria by raising a revolt in the Balkans and Hungary, and later he contemplated a raid.

2 He asked for the Neapolitan viceroyalty for life, which the king very wisely refused.

Death of Cavour.

Ricasoli Ministry.

Ricasoli Ministry.
into the Trentino; but the government, seeing the danger of such an attempt, arrested several Garibaldians at Sarnico (near Brescia), and in the meantime which followed several persons were shot. Garibaldi now became an opponent of the ministry, and in June went to Sicily, where, after taking counsel with his former followers, he decided on an immediate raid on Rome. He summoned his legionaries, and in August crossed over to Calabria with 1000 men. His intentions in the main were still loyal, for he desired to capture Rome for the kingdom; and he did his best to avoid the regulars tardily sent against him. On the 29th of August 1862, however, he encountered a force under Pallavicini at Aspromonte, and, although Garibaldi ordered his men not to fire, some of the raw Sicilian volunteers discharged a few volleys which were returned by the regulars. Garibaldi himself was seriously wounded and taken prisoner. He was shut up in the fortress of Taranto, and after endless discussions as to whether he should be tried or not, the question was settled by an amnesty. The affair made the ministry so unpopular that it was forced to resign. Farini, who succeeded, retired almost at once on account of ill-health, and Mignonetti became premier, with Visconti-Venosta as minister for foreign affairs. The financial situation continued to be seriously embarrassing; deficit was piled on deficit, loan upon loan, and the service of the debt rose from 90,000,000 lire in 1860 to 220,000,000 in 1864.

Negotiations were resumed with Napoleon for the evacuation of Rome by the French troops; but the emperor, though he saw that the temporal power could not for ever be supported by French bayonets, desired some guarantee that the evacuation should not be followed, at all events immediately, by an Italian occupation, lest Catholic opinion should lay the blame for this upon France. Ultimately the two governments concluded a convention on the 17th of September 1864, whereby France agreed to withdraw her troops from Rome so soon as the papal army should be reorganized, or at the outside within two years, Italy undertaking not to attack it nor permit others to do so, and to transfer the capital from Turin to some other city within six months.1 The change of capital would have the appearance of a definite abandonment of the Roma capitale programme, although in reality it was to be merely a tappa (stage) on the way. The convention was kept secret, but the last clause leaked out and caused the bitterest feeling among the people of Turin, who would have been resigned to losing the capital provided it were transferred to Rome, but resented the fact that it was to be established in any other city, and that the convention was without resulting paragraph. Provisions were held which were repressed with unnecessary violence, and although the change of capital was not unpopular in the rest of Italy, where the Piemontesino of the new régime was beginning to arouse jealousy, the secrecy with which the affair was arranged and the shooting down of the people in Turin raised such a storm of disapproval that the king for the first time used his privilege of dismissing the ministry. Under La Marmora’s administration the September convention was ratified, and the capital was transferred to Florence the following year. This affair resulted in an important political change, for the Piedmontese deputies, hitherto the bulwarks of moderate conservatism, now shifted to the Left or constitutional opposition.

Meanwhile, the Venetian question was becoming more and more acute. Every Italy was felt the presence of the Austrian in the lagunes as a national humiliation, and between 1859 and 1866 countless plots were hatched for their expulsion. But, in spite of the sympathy of the king, the attempt to raise armed bands in Venetia had no success, and it became clear that the foreigner could only be driven from the peninsula by regular war. To wage this alone Italy was still too weak, and it was necessary to look round for an ally. Napoleon was sympathetic; he desired to see the Austrians expelled, and the Syllabus of Pius IX., which had stirred up the more aggressive elements among the French clergy against his government, had brought him once more into harmony with the views of Victor Emmanuel; but he dared not brave French public opinion by another war with Austria, nor did Italy desire an alliance which would only have been bought at the price of further cessions. There remained Prussia, which, now that the Danish campaign of 1864 was over, was completing her preparations for the final struggle with Austria for the hegemony of Germany; and Napoleon, who saw in the furthering of Bismarck’s plans the surest means of securing his own influence in a divided Europe, willingly lent his aid in negotiating a Prusso-Italian alliance. In the summer of 1865 Bismarck made formal proposals to La Marmora; but the journaleers were interrupted by the conclusion of the convention of Gastein (August 14.), to which Austria agreed partly under pressure of the Prusso-Italian entente. To Italy the convention seemed like a betrayal; to Napoleon it was a set-back which he tried to retrieve by suggesting to Austria the peaceful cession of Venetia to the Italian kingdom, in order to prevent any danger of its alliance with Prussia. This proposal broke on the refusal of the emperor Francis Joseph to cede Austrian territory except as the result of a struggle; and Napoleon, won over by Bismarck at the famous interview at Biarritz, once more took up the idea of a Prusso-Italian offensive and defensive alliance. This was actually concluded on the 8th of April 1866. Its terms, dictated by a natural suspicion on the part of the Italian government, stipulated that it should only become effective in the event of Prussia declaring war on Austria within three months. Peace was not to be concluded until Italy should have received Venetia, and Prussia an equivalent territory in Germany.

The outbreak of war was postponed by further diplomatic complications. On the 12th of June Napoleon, whose policy throughout had been obscure and contradictory, signed a secret treaty with Austria, under which Venice was to be handed over to him, to be given to Italy in the event of her making a separate peace. La Marmora, however, who believed himself bound in honour to Prussia, refused to enter into a separate arrangement. On the 16th the Prussians began hostilities, and on the 20th Italy declared war.

Victor Emmanuel took the supreme command of the Italian army, and La Marmora resigned the premiership (which was assumed by Ricasoli), to become chief of the staff. La Marmora had three army corps (130,000 men) under his immediate command, to operate on the Mincio, while Cialdini with 80,000 men was to operate on the Adige. The Austrian southern army consisting of 95,000 men was commanded by the archduke Albert, with General von John as chief of the staff. On the 23rd of June La Marmora crossed the Mincio, and on the 24th a battle was fought at Custozza, under circumstances highly disadvantageous to the Italians, which after a stubborn contest ended in a crushing Austrian victory. Bad generalship, bad organization and the jealousy between La Marmora and Della Roca were responsible for this defeat. Custozza might have been afterwards retrieved, for the Italians had plenty of fresh troops besides Cialdini’s army; but nothing was done, as both the king and La Marmora believed the situation to be much worse than it actually was. On the 3rd of July the Prussians completely defeated the Austrians at Königgrätz, and on the 5th Austria ceded Venetia to Napoleon, accepting his mediation in favour of peace. The Italian iron-clad fleet, commanded by the incapable Persano, after wasting much time at Taranto and Ancona, made an unsuccessful attack on the Dalmatian island of Lissa on the 18th of July, and on the 20th was completely defeated by the Austrian squadron, consisting of wooden ships, but commanded by the capable Admiral Tegethoffer.

On the 22nd Prussia, without consulting Italy, made an armistice with Austria, while Italy obtained an eight days’ truce on condition of evacuating the Trentino, which had almost entirely
fallen into the hands of Garibaldi and his volunteers. Ricasoli wished to go on with the war, rather than accept Venetia as a gift from France; but the king and La Marmora saw that peace must be made, as the whole Austrian army of 350,000 men was now free to fall on Italy. An armistice was accordingly signed at Cormons on the 12th of August; Austria handed Venetia over to General Leboeuf, representing Napoleon; and on the 3rd of October peace between Austria and Italy was concluded at Vienna. On the 19th Leboeuf handed Venetia over to the Venetian representatives, and at the plebiscite held on the 21st and 22nd, 647,246 votes were returned in favour of union with Italy, only 60 against it. When this result was announced to the king by a deputation from Venice he said: "This is the finest day of my life; Italy is made, but it is not complete." Rome was still wanting.

Custozza and Lissa were not Italy's only misfortunes in 1866. There had been considerable discontent in Sicily, where the government had made itself unpopular. The priesthood and the remnants of the Bourbon party fomented an agitation, which in September culminated in an attack on Palermo by 500 armed insurgents, and in similar outbreaks elsewhere. The revolt was put down owing to the efforts of the mayor of Palermo, Marquis A. Di Rudiludi, and the arrival of reinforcements. The Ricasoli cabinet fell over the law against the religious houses, and was succeeded by that of Rattazzi, who with the support of the Left was apparently more fortunate. The French regular troops were withdrawn from Rome in December 1866; but the pontifical forces were largely recruited in France and commanded by officers of the imperial army, and service under the pope was considered by the French war office as equivalent to service in France. This was a violation of the letter as well as of the spirit of the September convention, and a stronger and more straightforward statesman than Rattazzi would have declared Italy absorbed from its provisions. Mazzini now wanted to promote an insurrection in Roman territory, whereas Garibaldi advocated an invasion from without. He delivered a series of violent speeches against the papacy, and made open preparations for a raid, which were not interfered with by the government; but on the 23rd of September 1867 Rattazzi had him suddenly arrested and imprisoned at Caperra. In spite of the vigilance of the wars he escaped on the 14th of October and landed in Tuscany. Armed bands had already entered papal territory, but achieved nothing in particular. Their presence, however, was a sufficient excuse for Napoleon, under pressure of the clerical party, to send another expedition to Rome (26th of October). Rattazzi, after ordering a body of troops to enter papal territory with no definite object, now resigned, and was succeeded by Mazzare. Garibaldi joined the bands on the 23rd, but his ill-armed and ill-disciplined force was very inferior to his volunteers of '49, '60 and '66. On the 24th he captured Monte Rotondo, but did not enter Rome as the expected insurrection had not broken out. On the 29th a French force, under de Fally, arrived, and on the 3rd of November a battle took place at Mentana between 4000 or 5000 red-shirts and a somewhat superior force of French and pontificals. The Garibaldis, mowed down by the new French chassepots rifles, fought until their last cartridges were exhausted, and retreated the next day towards the Italian frontier, losing 800 prisoners.

The affair of Mentana caused considerable excitement throughout Europe, and the Roman question entered on an acute stage. Napoleon suggested his favourite expedient of a congress, but the proposal broke down owing to Great Britain's refusal to participate; and Rouher, the French premier, declared in the Chamber (5th of December 1867) that France could never permit the Italians to occupy Rome. The attitude of France strengthened that anti-French feeling in Italy which had begun with Villafraanca; and Bismarck was not slow to make use of this hostility, with a view to preventing Italy from taking sides with France against Germany in the struggle between the two powers which he saw to be inevitable. At the same time Napoleon was making overtures both to Austria and to Italy, overtures which were favourably received. Victor Emmanuel was sincerely anxious to assist Napoleon, for in spite of Nice and Savoy and Mentana he felt a chivalrous desire to help the man who had fought for Italy. But with the French at Civitavecchia (they had left Rome very soon after Mentana) a war for France was not to be thought of, and Napoleon would not promise more than the literal observance of the September convention. Austria would not join France unless Italy did the same, and she realized that that was impossible unless Napoleon gave way about Rome. Consequently the negotiations were suspended. A scandal concerning the tobacco monopoly led to the fall of Menabrea, who was succeeded in December 1869 by Giovanni Lanza, with Visconti-Venosta at the foreign office and Q. Sella as finance minister. The latter introduced a sounder financial policy, which was maintained until the fall of the Right in 1876. Mazzini, now openly hostile to the monarchy, was seized with a perfect monomania for insurrections, and promoted various small risings, the only effect of which was to show how completely his influence was gone.

In December 1869 the XXI. ocumenical council began its sitings in Rome, and on 4th June 1870 pronounced the ininfallibility of the pope (see VATICAN COUNCIL). Two days previously Napoleon had declared war on Prussia, and immediately afterwards he withdrew his troops from Civitavecchia; but he persuaded Lanza to promise to abide by the September convention, and it was not until after Wörth and Gravevole that he offered to give Italy a free hand to occupy Rome. Then it was too late; Victor Emmanuel asked Thiers if he could give his word of honour that with 100,000 Italian troops France could be saved, but Thiers remained silent. Austria replied like Italy: "It is too late." On the 9th of August Italy made a declaration of neutrality, and three weeks later Visconti Venosta informed the powers that Italy was about to occupy Rome. On the 3rd of September the news of Sédan reached Florence, and with the fall of Napoleon's empire the September convention ceased to have any value. The powers having engaged to abstain from intervention in Italian affairs, Victor Emmanuel addressed a letter to Pius IX. asking him in the name of religion and peace to accept Italian protection instead of the fall of his kingdom. This power of the pope would only yield to force. On the 11th of September General Cadorna at the head of 60,000 men entered papal territory. The garrison of Civitavecchia surrendered to Bixio, but the 10,000 men in Rome, mostly French, Belgians, Swiss and Bavarians, under Kanzler, were ready to fight. Cardinal Antonelli would have come to terms, but the pope decided on making a sufficient show of resistance to prove that he was yielding to force. On the 20th the Italians began the attack, and General Mazé de la Roché's division having effected a breach in the Porta Pia, the pope ordered the garrison to cease fire and the Italians poured into the Eternal City followed by thousands of Roman exiles. By noon the whole city on the left of the Tiber was occupied and the garrison laid down their arms; the next day, at the pope's request, the Leonine City on the right bank was also occupied. It had been intended to leave that part of Rome to the pope, but by the earnest desire of the inhabitants it too was included in the Italian kingdom. At the plebiscite there were 133,682 votes for union and 157,030 for the separate powers. Italy had now occupied Rome.
account, but he generally quotes the opinions of those who disagree with him as well. Another voluminous but less valuable work is F. Bertolini’s Storia d’Italia dal 1814 al 1878, in 2 parts (Milan, 1880-1881). L. Chiala’s Lettere del Conte di Cavour (7 vols., Turin, 1883-1887); Zanardelli’s Storia di Cavour (Palermo, 1879) is thorough and trustworthy work. See also Zini’s Storia d’Italia (4 vols., Milan, 1875); Gualaert’s Gli ultimi rivolgimenti italiani (4 vols., Florence, 1850) is important for the period from 1831 to 1847, and so also is L. Farinà’s Storia d’Italia dal 1815 al 1848 (2 vols., Naples, 1857). R. Thayer’s Dawn of Italian Independence (Boston, 1893) is a guessing and not always accurate; C. Cantù’s Dell’indipendenza italiana cronistoria (Naples, 1872-1877) is reactionary and often unreliable; V. Bersezio, Il Regno di Vittorio Emanuele II (5 vols., Milan, 1879); G. Malan, British and English readers Counce’s E. Martignone Cesareo’s Liberation of Italy (London, 1895) is to be strongly recommended, and is indeed, for accuracy, fairness and synthesis, as well as for charm of style, one of the very best books on the subject in any language; Bolton King’s History of Italian Unity (2 vols., London, 1899) is bulky and less satisfactory, but contains a useful bibliography. A succinct account of the chief events of the period will be found in Sir Spencer Walpole’s History of Twenty-Five Years (London, 1894). See also the Cambridge Modern History, vol. x and xi (Cambridge, 1905–6), where full bibliographies will be found. (L. V.*)

F. History, 1870–1902

The downfall of the temporal power was hailed throughout Italy with unabashed enthusiasm. Abroad, Catholic countries at first received the tidings with resignation, and Protestant countries with joy. In France, where the Government of National Defence had replaced the Empire, Cremieux, as president of the government delegation at Tours, hastened to offer his congratulations to Italy. The occupation of Rome caused no surprise to the French government, which had been forewarned on 11th September of the Italian intentions. On that occasion Jules Favre had said: “The Constitution of the Vatican law is to be dead and, while refusing explicitly to denounce it, had admitted that unless Italy went to Rome the city would become a prey to dangerous agitators. At the same time he made it clear that Italy would occupy Rome upon her own responsibility. Agreeably surprised by this attitude on the part of France, Visconti-Venosta lost no time in conveying officially the thanks of Italy to the French government. He doubtless foresaw that the language of Favre and Cremieux would not be endorsed by the French Clericals. Prussia, while satisfied at the fall of the temporal power, seemed to fear lest Italy might recompense the absence of French opposition to the occupation of Rome by armed intervention in favour of Bismarck. Moreover, was indignant at the connivance of the Italian government in the Garibaldian expedition to Dijon, and was irritated by Visconti-Venosta’s plea in the Italian parliament for the integrity of French territory. The course of events in France, however, soon calmed German opposition.

The advent of Thiers, his attitude towards the petition of French bishops on behalf of the pope, the recall of Senard, the French minister at Florence—who had written to congratulate Victor Emmanuel on the capture of Rome—and the instructions given to his successor, the comte de Choiseul, to absent himself from Italy at the moment of the king’s official entry into the new capital (2nd July 1871), together with the haste displayed in appointing a French ambassador to the Holy See, rapidly cooled the cordiality of Franco-Italian relations, and reassured Bismarck on the score of any dangerous intimacy between the two governments.

The friendly attitude of France towards Italy during the period immediately subsequent to the occupation of Rome seemed to cow and to dishearten the Vatican. For a few weeks the relations between the Curia and the Italian authorities were marked by a conciliatory and respectful tone. The Secretariat of the Italian foreign office, Baron Blanc, who had accompanied General Cadorna to Rome, was received almost daily by Cardinal Antonelli, papal secretary of state, in order to settle innumerable questions arising out of the Italian occupation. The royal commissioner for finance, Giacomelli, had, as a precautionary measure, seized the pontifical treasury; but upon being informed by Cardinal Antonelli that among the funds deposited in the treasury were 1,000,000 crowns of Peter’s Pence offered by the faithful to the pope in person, the commissioner was authorized by the Italian council of state not only to restore this sum, but also to indemnify the Holy See for moneys expended for the service of the October coupon of the pontifical debt, that debt having been taken over by the Italian state. On the 29th of September Cardinal Antonelli further apprised Baron Blanc that he was about to issue drafts for the monthly payment of the 50,000 crowns inscribed in the pontifical budget for the maintenance of the pope, the Sacred College, the apostolic palaces and the papal guards. The Italian treasury at once honoured all the papal drafts, and thus contributed a first instalment of the 3,225,000 lire per annum afterwards placed by Article 4 of the Law of Guarantees at the disposal of the Holy See. Payments would have been regularly continued had not pressure from the French Clerical party coerced the Vatican into refusing any further instalment.

Once in possession of Rome, and guarantor to the Catholic world of the spiritual independence of the pope, the Italian government prepared judiciously to regulate its relations to the Holy See. A bill known as the Law of Guarantees was therefore framed and laid before parliament. The measure was an amalgam of Cavour’s scheme for a “free church in a free state,” of Ricasoli’s Free Church Bill, rejected by parliament four years previously, and of the proposals presented to Pius IX. By Count Ponza di San Martino in September 1870. After a debate lasting nearly two months the Law of Guarantees was adopted in secret ballot on the 21st of March 1871 by 185 votes against 106.

It consisted of two parts. The first, containing thirteen articles, recognized (Articles 1 and 2) the person of the pontiff as sacred and intangible, and while providing for free discussion of religious questions, punished insults and outrages against the pope in the same way as insults and outrages against the king. The papal orders were attributed to the pope (Article 3), who was further guaranteed the same precedence as that accorded to him by other Catholic sovereigns, and the right to maintain his Noble and Swiss guards. Article 4 provided for the maintenance of the Sacred College, the sacred palaces, the congregations, the Vatican chancery and the diplomatic service. The sacred palaces, museums and libraries were, by Article 5, exempted from all ordinary taxation, and perpetual enjoyment of the Vatican and Lateran buildings and gardens, and of the papal villa at Castel Gandolfo. Articles 6 and 7 forbade access of any Italian official or agent to the above-mentioned palaces or to any other public buildings, and guaranteed the liberty of residence of the pope. Authorization of the pope, concile or council. Article 8 prohibited the seizure or examination of any ecclesiastical papers, documents, books or registers of purely spiritual character. Article 9 guaranteed to the pope the right to visit by all ecclesiastical seminaries, academies, colleges and schools for the education of priests in the city of Rome from all interference on the part of the Italian government.

The two portions of the bill seemed to reassure foreign Catholics, met with little opposition; but the second portion, regulating the relations between state and church in Italy, was sharply criticized by deputies who, like Sella, recognized the ideal of a “free church in a free state” to be an impracticable dream. The second division of the law abolished intervention in the Holy See, the right of meeting of members of the clergy. By Article 15 the government relinquished its rights to apostolic legation in Sicily, and to the appointment of its own nominees to the chief benefices throughout the kingdom. Bishops were further dispensed from swearing fealty to the king, though, except in Rome and suburbs, the choice of bishops was limited to ecclesiastics of Italian nationality. Article 16 abolished the need for royal assent and place for ecclesiastical publications, but subordinated the enjoyment of temporalities by...
bishops and priests to the concession of state
exequatur and placet.
Article 17 maintained the independence of the ecclesiastical jurisdic-
tion in spiritual and disciplinary matters, but reserved for the state the exclusive right to carry out coercive measures.

On the 12th of July 1871, Articles 268, 269 and 270 of the
Italian Penal Code were so modified as to make ecclesiastics liable to imprisonment for periods varying from six months to five years, and to fines from 1000 to 3000 lire, for spoken or written attacks against the laws of the state, or for the fomenta-
tion of disorder. An encyclical of Pius IX. to the bishops of the
Catholic Church on the 15th of May 1871 repudiated the Law of
Guarantees, and summoned Catholic princes to co-operate in
restoring the temporal power. Practically, therefore, the law has
remained a one-sided enactment, by which Italy considers herself
bound, and of which she has always observed the spirit, not the
letter. The exigencies of self-defence may have led in some
minor respects to non-observance of the letter. The annuity
payable to the pope has, for instance, been made subject to
quinquennial prescription, so that in the event of tardy recogni-
tion of the law the Vatican could at no time claim payment of
more than five years' annuity with interest.

For a few months after the occupation of Rome pressing
questions incidental to a new change of capital and to the adminis-
tration of a new domain distracted public attention from the
real condition of Italian affairs. The rise of the Tiber and
the flooding of Rome in December 1870 (tautly used by Victor
Emmanuel as an opportunity for a first visit to the new
capital) illustrated the imperative necessity of reorganizing the
drainage of the city and of constructing the Tiber embankment.
In spite of pressure from the French government, which desired
Italy to maintain Florence as the political and to regard Rome
merely as the moral capital of the realm, the government
office and both legislative chambers were transferred in 1871 to
the Eternal City. Early in the year the crown prince Humbert with
the Princess Margherita took up their residence in the Quirinal
Palace, which, in view of the Vatican refusal to deliver up the
keys, had to be opened by force. Eight monasteries were
expropriated to make room for the chief state departments,
pending the construction of more suitable edifices. The growth of
Clerical influence in France engendered a belief that Italy
would soon have to defend with the sword her newly-won unity,
while the tremendous lesson of the Franco-Prussian War con-
vinced the military authorities of the need for thorough military
reform. General Ricotti Magnani, minister of war, therefore
framed an Army Reform Bill designed to bring the Italian
army as nearly as possible up to the Prussian standard. Sella, minister
of finance, notwithstanding the sorry plight of the Italian
exchequer, readily granted the means for the project. "We must
pay or we must die," he said, "since we have overthrown the papal
throne," and he pointed to France as the quarter from which
attack was most likely to come.

Though perhaps less desperate than during the previous decade,
the condition of Italian finance was precarious indeed. With
taxation screwed up to breaking point on personal and
real estate, on all forms of commercial and industrial
activity, and on salt, flour and other necessaries of life; with a
deficit of £8,500,000 for the current year, and the prospect of a
further aggregate deficit of £17,000,000 during the next
quinquennium, Sella's heroic struggle against national bankruptcy
was still far from a successful termination. He chiefly had
borne the brunt and won the laurels of the unprecedented fight
against deficit in which Italy had been involved since 1862.

As finance minister in the Rattazzi cabinet of that year he had
been confronted with a public debt of nearly £120,000,000, and
with an aggregate deficit of nearly £1,500,000 in the past year,
as minister in the La Marmora cabinet, he had again to face an
excess of expenditure over income amounting to more than
£14,400,000. By the seizure and sale of Church lands, by the
sale of state railways, by "economy to the bone" and on one
supreme occasion by an appeal to taxpayers to advance a year's
quota of the land-tax, he had met the most pressing engagements of
that troublous period. The king was persuaded to forgo
one-fifth of his civil list, ministers and the higher civil servants
were required to relinquish a portion of their meagre salaries,
but, in spite of all, Sella had found himself in 1863 compelled
to propose the most hated of fiscal burdens—a grist tax on
vegetables. This tax (macinato) had long been known in Italy.

Vexatious methods of assessment and collection had made it so
popular that the Italian government in 1859-1860 had thought
it expedient to abolish it throughout the realm. Sella hoped
by the application of a mechanical meter both to obviate the
odium attaching to former methods of collection and to avoid the
maintenance of an army of inspectors and tax-gatherers, whose
stipends had formerly eaten up most of the proceeds of the
impost. Before proposing the reintroduction of the tax, Sella
and his friend Ferrara improved and made exhaustive experimen-
tations with the meter. The result of their efforts was laid before
parliament in one of the most monumental and most painstaking
presentations ever presented to a bill. Sella, nevertheless, fell
before the storm of opposition which his scheme aroused. Scialoja,
who succeeded him, was obliged to adopt a similar proposal,
but parliament again proved refractory. Ferrara, successor of
Scialoja, met a like fate; but Count Cambray-Digny, finance
minister in the Menabrea cabinet of 1868-1869, driven to find
means to cover a deficit aggravated by the interest on the
Venetian debt, succeeded, with Sella's help, in forcing a Grist
Tax Bill through parliament, though in a form in which Sella
could not entirely approve. When, on the 1st of January 1869,
the new tax came into force, nearly half the flour-mills in Italy
closed work. In many districts the government was obliged
to open mills on its own account. Inspectors and tax-gatherers
did their work under police protection, and in several parts of
the country riots had to be suppressed manu militari. At first
the net revenue from the impost was less than £1,100,000; but
under Sella's firm administration (1869-1873), and in consequence
of improvements gradually introduced by him, the net return of
an impost which ultimately exceeded £5,200,000. The parliamentary
opposition to the impost, which the Left denounced as "the tax on
hunger," was largely factitious. Few, except the open partisans of
national bankruptcy, doubted its necessity; yet so strong was the
current of feeling worked up for party purposes by opponents of
the measure, that Sella's achievement in having by its means saved
the financial situation of Italy deserves to rank among the most
noteworthy performances of modern parliamentary statesman-
ship.

Under the stress of the appalling financial conditions
represented by chronic deficit, crushing taxation, the heavy
expenditure necessary for the consolidation of the kingdom, the
reform of the army and the interest on the pontifical debt, Sella,
on the 11th of December 1871, exposed to parliament the
financial situation in all its nakedness. He recognized that
considerable improvement had already taken place. Revenue
from taxation had risen in a decade from £7,000,000 to
£20,200,000; profit on state monopolies had increased from
£7,000,000 to £6,400,000; exports had grown to exceed imports;
income from the working of telegraphs had tripled itself; rail-
ways had been extended from 2200 to 6200 kilometres, and
the annual travelling public had augmented from 15,000,000 to
25,000,000 persons. The serious feature of the situation lay
less in the income than in the "intangible" expenditure, namely,
the vast sums required for interest on the various forms of public
debt and for pensions. Within ten years this category of outlay
had increased from £8,000,000 to £28,800,000. During the
same period the assumption of the Venetian and Roman debts, losses
on the issue of loans and the accumulation of annual deficits,
had caused public indebtedness to rise from £92,000,000 to
£28,800,000, no less than £1,000,000 of the latter sum having
been sacrificed in premiums and commissions to bankers and
underwriters. It was then Sella had reduced the deficit to less than
£2,000,000 in 1871, but for 1872 he found himself confronted with a total expenditure
of £8,000,000 in excess of revenue. He therefore proposed to make
over the treasury service to the state banks, to increase the
forced currency, to raise the stamp and registration duties and
to impose a new tax on textile fabrics. An optional conversion of sundry internal loans into consolidated stock at a lower rate of interest was calculated to effect considerable saving. The battle over these proposals was long and fierce. But for the tactics of Rattazzi, leader of the Left, who, by basing his opposition on party considerations, impeded the secession of Minghetti and a part of the Right from the ministerial majority, Sella would have been defeated. On the 23rd of March 1872, however, he succeeded in carrying his programme, which not only provided for the pressing needs of the moment, but laid the foundation of the much-needed equilibrium between expenditure and revenue.

In the spring of 1873 it became evident that the days of the Lanza-Sella cabinet were numbered. Fear of the advent of a Radical administration under Rattazzi alone prevented the Minghettian Right from revolting against the government. The Left, conscious of its strength, impatiently awaited the moment of accession to power. Sella, the real head of the Lanza cabinet, was worn out by four years’ continuous work and disheartened by the pernicious misrepresentation in which Italian politicians, particularly those of the Left, have ever excelled. By sheer force of will he compelled the Chamber early in March to adopt some minor financial reforms, but on the 29th of April found himself in a minority on the question of a credit for a proposed state arsenal at Taranto. Pressure from all sides of the House, however, induced the ministry to retain office until after the debate on the application to Rome and the Papal States of the Religious Orders Bill (originally passed in 1866)—a measure which, with the help of Ricasoli, was carried at the end of May. While leaving intact the general houses of the various confraternities (except that of the Jesuits), the bill abolished the corporate personality of religious orders, handed over their schools and hospitals to civil administrators, placed their churches at the disposal of the secular clergy, and provided pensions for nuns and monks, those who had families being sent to reside with their relatives, and those who by reason of age or bereavement had no home but their monasteries being allowed to end their days in religious houses specially set apart for the purpose. The proceeds of the sale of the suppressed convents and monasteries were partly converted into pensions for monks and nuns, and partly allotted to the municipal charity boards which had undertaken the educational and charitable functions formerly exercised by the religious orders. To the pope was made over £16,000 per annum as a contribution to the expense of maintaining in Rome representatives of foreign orders; the Sacred College, however, rejected this endowment, and summoned all the suppressed confraternities to reconstitute themselves under the ordinary Italian law of association. A few days after the passage of the Religious Orders Bill, the death of Rattazzi (5th June 1873) removed all probability of the immediate advent of the Left. Sella, uncertain of the loyalty of the Right, challenged a vote on the immediate discussion of further financial reforms, and on the 23rd of June was overthrown by a coalition of the Left under Depretis with a part of the Right under Minghetti and the Tuscan Centre under Correnti. The administration which thus became unquestionably the best, had completed national unity, transferred the capital to Rome, overcome the chief obstacles to financial equilibrium, initiated military reform and laid the foundation of the relations between state and church.

The succeeding Minghetti-Visconti Venosta cabinet—which held office from the 10th of July 1873 to the 18th of March 1876—continued in essential points the work of the preceding administration. Minghetti’s finance, though less clear-sighted and less resolute than that of Sella, was on the whole prudent and beneficial. With the aid of Sella he concluded conventions for the redemption of the chief Italian railways from their French and Austrian proprietors. By dint of expedients he gradually overcame the chronic deficit, and, owing to the normal increase of revenue, ended his term of office with the announcement of a surplus of some £720,000. The question whether this surplus was real or only apparent has been much debated, but there is no reason to doubt its substantial reality. It left out of account a sum of £1,000,000 for railway construction which was covered by credit, but on the other hand, took no note of £300,000 expended in the redemption of debt. Practically, therefore, the Right, of which the Minghetti cabinet was the last representative administration, left Italian finance with a surplus of £80,000. Outside the all-important domain of finance, the attention of Minghetti and his colleagues was principally absorbed by strife between church and state, army reform and railway redemption. For some time after the occupation of Rome the pope, in order to substantiate the pretence that his spiritual freedom had been diminished, avoided the creation of cardinals and the nomination of bishops. On the 22nd of December 1873, however, he unexpectedly created twelve cardinals, and subsequently proceeded to nominate a number of bishops. Visconti Venosta, who had retained the portfolio for foreign affairs in the Minghetti cabinet, at once drew the attention of the European powers to this proof of the pope’s spiritual freedom and of the imaginary nature of his “imprisonment” in the Vatican. At the same time he assured them that absolute liberty would be guaranteed to the deliberations of a concile. In relation to the Church in Italy, Minghetti’s policy was less perspicacious. He let it be understood that the announcement of the appointment of bishops and the request for the royal exequatur might be made to the government impersonally by the congregation of bishops and regulars, by a municipal council or by any other corporate body—a concession of which the bishops were quick to take advantage, but which so irritated Italian political opinion that, in July 1875, the government was compelled to withdraw the temporalities of ecclesiastics who had neglected to apply for the exequatur, and to evict sundry bishops who had taken possession of their palaces without authorization from the state. Parliamentary pressure further obliged Bonghi, minister of public instruction, to compel clerical seminaries either to forgo the instruction of lay pupils or to conform to the laws of the state in regard to inspection and examination, an ordinance which gave rise to conflicts between ecclesiastical and lay authorities, and led to the forcible dissolution of the Mantua seminary and to the suppression of the Catholic university in Rome.

More noteworthy than its management of internal affairs were the efforts of the Minghetti cabinet to strengthen and consolidate national defence. Appalled by the weakness, or rather the non-existence, of the navy, Admiral Saint-Bon, with his coadjutor Signor Brin, addressed himself earnestly to the task of recreating the fleet, which had never recovered from the effects of the disaster of Lissa. During his three years of office he laid the foundation upon which Brin was afterwards to build up a new Italian navy. Simultaneously General Ricotti Magnani matured the army reform scheme which he had elaborated under the preceding administration. His bill, adopted by parliament on the 7th of June 1875, still forms the ground plan of the Italian army.

It was fortunate for Italy that during the whole period 1869–1876 the direction of her foreign policy remained in the experienced hands of Visconti Venosta, a statesman whose trustworthiness, dignity and moderation even political opponents have been compelled to recognize. Diplomatic records fail to substantiate the accusations of lack of initiative and instability of political criterion currently brought against him by contemporaries. As foreign minister of a young state which had attained unity in defiance of the most formidable religious organization in the world and in opposition to the traditional policy of France, it could but be Visconti Venosta’s aim to uphold the dignity of his country while convincing European diplomacy that United Italy was an element of order and progress, and that the spiritual independence of the Roman pontiff had suffered no diminution. Prudence, moreover, counselled avoidance of all action likely to serve the predominant anti-Italian party in France as a pretext for violent intervention in favour of the pope. On the occasion of the Metrical Congress, which met in Paris in 1872, he, however, successfully protested against the recognition of the Vatican delegate, Father Secchi.
as a representative of a "state," and obtained from Count de Rémusat, French foreign minister, a formal declaration that the presence of Father Secchi on that occasion could not constitute a diplomatic precedent. The irritation displayed by Bismarck at the Francophil attitude of Italy towards the end of the Franco-German War gave place to a certain show of goodwill when the great chancellor found himself in his turn involved in a struggle against the Vatican and when the policy of Thiers began to strain Franco-Italian relations. Thiers had consistently opposed the emperor Napoleon's pro-Italian policy. In the case of Italy, as in that of Germany, he frankly regretted the constitution of powerful homogeneous states upon the borders of France. Personal pique accentuated this feeling in regard to Italy. The refusal of Victor Emmanuel II. to meet Thiers at the opening of the Mont Cenis tunnel (a refusal not unconnected with offensive language employed at Florence in October 1870 by Thiers during his European tour, and with his instructions to the French minister to remain absent from Victor Emmanuel's official entry into Rome) had wounded the amour propre of the French statesman, and had decreased whatever inclination he might otherwise have felt to oppose the French policy of retaining the restoration of the temporal power, and for French interference with the Italian Religious Orders Bill. Consequently relations between France and Italy became so strained that in 1873 both the French minister to the Quirinal and the Italian minister to the Republic remained for several months absent from their posts. At this juncture the emperor of Austria invited Victor Emmanuel to visit the Vienna Exhibition, and the Italian government received a confidential intimation that acceptance of the invitation to Vienna would be followed by a further invitation from Berlin. Perceiving the advantage of a visit to the imperial and apostolic court after the Italian occupation of Rome and the suppression of the religious orders, and convinced of the value of more cordial intercourse with the German empire, Visconti-Venosta and Minighetti advised their sovereign to accept both the Austrian and the subsequent German invitations. The visit to Vienna took place on the 17th to the 22nd of September, and that to Berlin on the 22nd to the 26th of September 1873, the Italian monarch being accorded in both capitals a most cordial reception, although the contemporaneous publication of La Marmora's famous pamphlet, More Light on the Events of 1866, prevented intercourse between the Italian ministers and Bismarck from being entirely confidential. Visconti-Venosta and Minighetti, moreover, wisely resisted the chancellor's pressure to override the Law of Guarantees and to engage in an Italian Kulturkampf. Nevertheless the royal journey contributed notably to the establishment of cordial relations between Italy and the central powers, relations which were further strengthened by the visit of the emperor Francis Joseph to Victor Emmanuel at Venice in April 1875, and by that of the German emperor to Milan in October of the same year. Meanwhile Thiers had given place to Marshal Macmahon, who effected a decided improvement in Franco-Italian relations by recalling from Civitavecchia the cruiser "Orneque," which since 1870 had been lying outside the port at the disposal of the French, to be used in the event of a Franco-Italian war, and which had been proposed for the invasion of Italy.

The fall of the Right on the 18th of March 1876 was an event destined profoundly and in many respects adversely to affect the course of Italian history. Except at rare and not auspicious intervals, the Right had held office from 1849 to 1876. Its rule was associated in the popular mind with severe administration; hostility to the democratic elements represented by Garibaldi, Crispi, Depretis and Bertani; ruthless imposition and collection of taxes in order to meet the financial engagements forced upon Italy by the vicissitudes of her Risorgimento; strong predilection for Piedmontese, Lombards and Tuscans, and a steady determination, not always scrupulous in its choice of means, to retain executive power and the most important administrative offices of the state for the consorteria, or close corporation, of its own adherents. For years the men of the Left had worked to inoculate the electorate with suspicion of Conservative methods and with hatred of the imposts which they nevertheless knew to be indispensable to sound finance. In regard to the grisst tax especially, the agitators of the Left had placed their party in a radically false position. Moreover, the redemption of the railways by the state—contracts for which had been signed by Sella in 1875 on behalf of the Minighetti cabinet with Rothschild at Basel and with the Austrian government at Vienna—had been fiercely opposed by the Left, although its members were for the most part convinced of the utility of the operation. When, at the beginning of March 1876, these contracts were submitted to parliament, a group of Tuscan deputies, under Cesare Correnti, joined the opposition, and on the 18th of March took advantage of a chance motion concerning the date of discussion of an interpelation on the grisst tax to place the Minighetti cabinet in a minority. Depretis, ex-prodicator of Sicily, and successor of Rattazzi in the leadership of the Left, was entrusted by the king with the formation of a liberal ministry. Besides Correnti, Depretis assumed the portfolio of finance; Nicotera, an ex-Garibaldian of somewhat tarnished reputation, but a man of energetic and conservative temperament, was placed at the ministry of the interior; public works were entrusted to Zanardelli, a Radical doctrinaire of considerable juridical attainments; General Mezzacapo and Signor Brin replaced General Ricotti Magnani and Admiral Saint-Bon at the war office and ministry of marine; while to Mancini and Coppino, prominent members of the Left, were allotted the portfolios of justice and public instruction. Great difficulty was experienced in finding a foreign minister willing to challenge comparison with Visconti-Venosta. Several diplomats in active service were approached, but, partly on account of their refusal, and partly from the desire of the Left to avoid giving so important a post to a diplomatist bound by ties of friendship or of interest to the Right, the choice fell upon Melegari, Italian minister at Bern.

The new ministers had long since made monarchical professions of faith, but, up to the moment of taking office, were nevertheless considered to be tinged with an almost revolutionary hue. The king alone appeared to feel no misgiving. His shrewd sense of political expediency and his loyalty to constitutional principles saved him from the error of obstructing the advent and driving into an anti-dynastic attitude politicians who had succeeded in winning popular favour. Indeed, the patriotism and loyalty of the new ministers were above suspicion. Danger lay rather in entrusting men schooled in political conspiracy and in unscrupulous parliamentary opposition with the government of a young state still beset by enemies at home and abroad. As an opposition party the Left had lived upon the facile credit of political promises, but had no well-considered programme nor other discipline nor unity of purpose than that born of the common eagerness of its leaders for office and their common hostility to the Right. Neither Depretis, Nicotera, Crispi, Cairoli nor Zanardelli was disposed permanently to recognize the superiority of any one chief. The dissensions which broke out among them within a few months of the accession of their party to power never afterwards disappeared, except at rare moments when it became necessary to unite in preventing the return of the Conservatives. Considerations such as these could not be expected to appeal to the nation at large, which hailed the advent of the Left as the dawn of an era of unlimited popular sovereignty, diminished administrative pressure, reduction of taxation and general prosperity. The programme of Depretis corresponded only in part to these expectations. Its chief points were extension of the franchise, incompatibility of a parliamentary mandate with an official position, strict enforcement of the rights of the State in regard to the Church, protection of freedom of conscience, maintenance of the military and naval policy inaugurated by the Conservatives, acceptance of the railway redemption contracts, consolidation of the financial equilibrium, abolition of the forced
currency, and, eventually, fiscal reform. The long-promised abolition of the grist tax was not explicitly mentioned, opposition to the railway redemption contracts transformed into approval, and the vaunted reduction of taxation replaced by lip-service to the Conservative deity of financial equilibrium. The railway redemption contracts were in fact immediately voted by parliament, with a clause pledging the government to legislate in favour of farming out the railways to private companies.

Nicotera, minister of the interior, began his administration of home affairs by a sweeping change in the personnel of the prefects, sub-prefects and public prosecutors, but found himself obliged to incur the wrath of his supporters by prohibiting Radical meetings likely to endanger public order, and by enunciating administrative principles which would have befitted an inveterate conservative. In regard to the Church, he instructed the prefects strictly to prevent infraction of the law against religious orders. At the same time the cabinet, as a whole, brought in a Clerical Abuses Bill, threatening with severe punishment priests guilty of disturbing the peace of families, of opposing the laws of the state, or of fomenting disorder. Depretis, for his part, was compelled to declare impracticable the immediate abolition of the grist tax, and to frame a bill for the increase of revenue, acts which caused the succession of some sixty Radicals and Republicans from the ministerial majority, and gave the signal for an agitation against the premier similar to that which he himself had formerly undertaken against the Right. The first general election under the Left (November 1876) had yielded the cabinet the overwhelming majority of 421 Ministerialists against 87 Conservatives, but the very size of the minority rendered it unmanageable. The Clerical Abuses Bill provoked further dissensions: Nicotera was severely affected by revelations concerning his political past; Zanardelli refused to sanction the construction of a railway in Calabria in which Nicotera was interested; and Depretis saw fit to compensate the supporters of his bill for the increase of revenue by decorating at one stroke sixty ministerial deputies with the Order of the Crown of Italy. A further derogation from the ideal of democratic austerity was committed by adding £80,000 per annum to the king’s civil list (14th May 1877) and by burdening the state exchequer with royal household pensions amounting to £20,000 a year. The civil list, which the law of the 10th of August 1862 had fixed at £650,000 a year, but which had been voluntarily reduced by the king to £530,000 in 1864, and to £490,000 in 1867, was thus raised to £570,000 a year. Almost the only respect in which the Left could boast a decided improvement over the administration of the Right was the energy displayed by Nicotera in combating brigandage and the mafia in Calabria and Sicily. Successes achieved in those provinces failed, however, to save Nicotera from the wrath of the Chamber, and on the 14th of December 1877 a cabinet crisis arose over a question concerning the secrecy of the legislative correspondence. Depretis thereupon reconstructed his administration, excluding Nicotera, Melegari and Zanardelli, placing Crispi at the home office, entrusting Maglioni with finance, and himself assuming the direction of foreign affairs.

In regard to foreign affairs, the début of the Left as a governing party was scarcely more satisfactory than its home policy. Since the war of 1866 the Left had advocated an Italo-Prussian alliance in opposition to the Franco-Prussian tendencies of the Right. On more than one occasion Bismarck had maintained direct relations with the chiefs of the Left, and had in 1870 worked to prevent a Franco-Italian alliance by encouraging the “party of action” to press for the occupation of Rome. Besides, the Left stood for anticlericalism and for the retention by the State of means of coercing the Church, in opposition to the men of the Right, who, with the exception of Sella, favoured Cavour’s ideal of “a free Church in a free State,” and the consequent abandonment of state control over ecclesiastical government. Upon the outbreak of the Prussian Kulturkampf the Left had pressed the Right to introduce an Italian counterpart to the Prussian May laws, especially as the attitude of Thiers and the hostility of the French Clericals obliterated the need for sparing French susceptibilities. Visconti Venosta and Minghetti, partly from aversion to a Jacobin policy, and partly from a conviction that Bismarck sooner or later would undertake his Gang nach Canossa, regardless of any tacit engagement he might have assumed towards Italy, had wisely declined to be drawn into any infraction of the Law of Guarantees. It was, however, expected that the chiefs of the Left, upon attaining office, would turn resolutely towards Prussia in search of a guarantee against the Clerical menace embodied in the régime of Marshal Macmahon. On the contrary, Depretis and Melegari, both of whom were imbued with French Liberal doctrines, adopted towards the Republic an attitude so deferential as to arouse suspicion in Vienna and Berlin. Depretis recalled Negra from Paris and replaced him by General Cialdini, whose ardent plea for Italian intervention in favour of France in 1870, and whose comradeship with Marshal Macmahon in 1859, would, it was supposed, render him persona gratissima to the French government. This calculation was falsified by events. Incensed by the elevation to the rank of embassies of the Italian legation in Paris and the French legation to the Quirinal, and by the introduction of the Italian bill against clerical abuses, the French Clerical party not only attacked Italy and her representative, General Cialdini, in the Chamber of Deputies, but promoted a monster petition against the Italian bill. Even the coup d’état of the 16th of May 1877 (when Macmahon dismissed the Jules Simon cabinet for opposing the Clerical petition) hardly averted to change the attitude of Depretis. As a precaution against an eventual French attempt to restore the temporal power, orders were hurriedly given to complete the defences of Rome, but in other respects the Italian government maintained its subservient attitude. Yet at that moment the adoption of a clear line of policy, in accord with the central powers, might have saved Italy from the loss of prestige entailed by her bearing in regard to the Russo-Turkish War and the Austrian acquisition of Bosnia, and might have prevented the disappointment subsequently occasioned by the outcome of the Congress of Berlin. In the hope of inducing the European powers to “compensate” Italy for the increase of Austrian influence on the Adriatic, Crispi undertook in the autumn of 1877, with the approval of the king, and in spite of the half-disguised opposition of Depretis, a semi-official mission to Paris, Berlin, London and Vienna. The mission appears not to have been unqualified success, though Crispi afterwards affirmed in the Chamber (4th March 1886) that Depretis might in 1877 “have harried fortune to the Italian character.” Depretis, anxious not to avoid “a crisis of adverse judgment,” let slip whatever opportunity may have presented itself, and neglected even to deal energetically with the impotent but mischievous Italian agitation for a “rectification” of the Italo-Austrian frontier. He greeted the treaty of San Stefano (3rd March 1878) with undisguised relief, and by the mouth of the king, congratulated Italy (7th March 1878) on having maintained with the powers friendly and cordial relations “free from suspicious precautions,” and upon having secured for herself “that most precious of alliances, the alliance of the future”—a phrase of which the empty rhetoric was to be bitterly demonstrated by the Berlin Congress and the French occupation of Tunisia. The entry of Crispi into the Depretis cabinet (December 1877) placed at the ministry of the interior a strong hand and sure eye at a moment when they were about to become imperatively necessary. Crispi was the only man of truly statesmanlike calibre in the ranks of the Left. Formerly a friend and disciple of Mazzini, with whom he had broken on the question of the monarchical form of government which Crispi believed indispensable to the unification of Italy, he had afterwards been one of Garibaldi’s most efficient coadjutors and an active member of the “party of action.” Passionate, not always scrupulous in his choice and use of political weapons, intensely patriotic, loyal with a loyalty based rather or than sentiment, quick-witted, prompt in action, determined and pertinacious, he possessed in eminent degree many qualities lacking in other...
The Depretis-Crispi cabinet did not long survive the opening of the new reign. Crispi's position was shaken by a morally plausible but juridically untenable charge of bigamy, while on the 8th of March the election of Cairoli, an opponent of the ministry and head of the extermin section of the Left, to the presidency of the Chamber, induced Depretis to tender his resignation to the new king. Cairoli succeeded in forming an administration, in which his friend Count Corti, Italian ambassador at Constantinople, accepted the portfolio of foreign affairs, Zanardelli the ministry of the interior, and Seismit Doda the ministry of finance. Though the cabinet had no stable majority, it induced the Chamber to sanction a commercial treaty which had been negotiated with France and a general "autonomous" customs tariff. The commercial treaty was, however, rejected by the French Chamber in June 1878, a circumstance necessitating the application of the Italian general tariff, which implied a 10 to 20% increase in the duties on the principal French exports. A highly imaginative financial exposition by Seismit Doda, who announced a surplus of £3,400,000, paved the way for a Grist Tax Reduction Bill, which Cairoli had taken over from the Depretis programme. The Chamber, though convinced of the danger and folly of the project, which were incisively demonstrated by Sella, voted by an overwhelming majority for an immediate reduction of the impost by one-fourth, and its complete abolition within four years. Cairoli's premiership was, however, destined to be cut short by an attempt made upon the king's life in November 1878, during a royal visit to Naples, by a miscreant named Passanante. In spite of the courage and presence of mind of Cairoli, who received the dagger thrust intended for the king, public and parliamentary indignation found expression in a vote which compelled the ministry to resign.

Though brief, Cairoli's term of office was momentous in regard to foreign affairs. The treaty of San Stefano had led to the convocation of the Berlin Congress, and though Count Corti was by no means ignorant of the rumours concerning secret agreements between Germany, Austria, and Russia, and Germany, Austria and Great Britain, he scarcely seemed alive to the possible effect of such agreements upon Italy. Replying on the 9th of April 1878 to interpellations by Visconti-Venosta and other deputies on the impending Congress of Berlin, he appeared free from apprehension lest Italy, isolated, might find herself face to face with a change of the balance of power in the Mediterranean, and declared that in the event of serious complications Italy would be "too much sought after rather than too much forgotten." The policy of Italy in the congress, he added, would be to support the interests of the young Balkan nations. Wrapped in this optimism, Count Corti proceeded, as first Italian delegate, to Berlin, where he found himself obliged, on the 28th of May, to join reluctantly in sanctioning the Austrian occupation of Bosnia and Herzegovina. On the 8th of July the revelation of the Anglo-Ottoman treaty for the British occupation of Cyprus took the congress by surprise. Italy, who had made the integrity of the Ottoman empire a cardinal point of her Eastern policy, felt this change of the Mediterranean status quo the more severely inasmuch as, in order to sign the treaty with Great Britain, she had turned a deaf ear to Austrian, Russian and German advice to prepare to occupy Tunisia in agreement with Great Britain. Count Corti had no suspicion that France had adopted a less disinterested attitude towards similar suggestions from Bismarck and Lord Salisbury. He therefore returned from the German capital with "clean" but empty hands, a plight which found marked disfavour in Italian eyes, and stimulated anti-Austrian Irredentism. Ever since Venetia had been ceded to Austria to the emperor Napoleon, and by him to Italy, after the war of 1866, secret revolutionary committees had been formed in the northern Italian provinces to prepare for the "redemption" of Trent and Trieste. For twelve years these committees had remained comparatively inactive, but in 1878 the presence of the ex-Garibaldian Cairoli at the head of the government, and popular dissatisfaction at the
spread of Austrian sway on the Adriatic, encouraged them to begin a series of noisy demonstrations. On the evening of the signature at Berlin of the clause sanctioning the Austrian occupation of Bosnia and Herzegovina, an Irredentist riot took place before the Austrian consulate at Venice. The Italian government attached little importance to the occurrence, and believed that a diplomatic expression of regret would suffice to allay Austrian irritation. Austria, indeed, might easily have been persuaded to ignore the Irredentist agitation, had not the equivocal attitude of Cairoli and Zanardelli cast doubt upon the sincerity of their regret. The former at Pavia (13th October 1878), and the latter at Arco (3rd November), declared publicly that Irredentist manifestations could not be prevented under existing laws, but gave no hint of introducing any law to sanction their prevention. "Repression, not prevention" became the official formula, the enunciation of which by Cairoli at Pavia caused Count Cairoli and two other ministers to resign.

The fall of Cairoli, and the formation of a second Depretis cabinet in 1878, brought no substantial change in the attitude of the government towards Irredentism, nor was the position improved by the return of Cairoli to power in the following July. Though aware of Bismarck's hostility towards Italy, of the conclusion of the Austro-German alliance of 1879, and of the undisguised ill-will of France, Italy not only made no attack to crush an agitation as mischievous as it was futile, but granted a state funeral to General Avezzana, president of the Irredentist League. In邦ghi's mordant phrase, the foreign policy of Italy during this period may be said to have been characterized by "enormous intellectual impotence counterbalanced by equal moral feebleness." Home affairs were scarcely better managed. Parliament had degenerated into a congeries of personal groups, whose members were eager only to overturn cabinets in order to secure power for the leaders and official favours for themselves. Depretis, who had succeeded Cairoli in December 1878, fell in July 1879, after a vote in which Cairoli and Nicotera joined the Conservative opposition. On 12th July Cairoli formed a new administration, only to resign on 24th November, and to reconstruct his cabinet with the help of Depretis. The administration of finance was as chaotic as the condition of parliament. The £2,400,000 surplus announced by Seismit Doda proved to be a myth. Nevertheless Magliani, who succeeded Seismit Doda, had neither the perspicacity nor the courage to resist the abolition of the grit tax. The first vote of the Chamber for the immediate diminution of the tax, and for its total abolition on 1st January 1883, had been opposed by the Senate. A second bill was passed by the Chamber on 18th July 1879, providing for the immediate repeal of the grit tax on minor cereals, and for its total abolition on 1st January 1884. While approving the repeal in regard to minor cereals, the Senate (24th January 1880), again rejected the repeal of the tax on grinding wheat as prejudicial to national finance. After the general election of 1880, however, the Ministerialists, aided by a number of factious Conservatives, passed a third bill repealing the grit tax on wheat (10th July 1880), the repeal to take effect from the 1st of January 1884 onwards. The Senate, in which the partisans of the ministry had been increased by numerous appointments ad hoc, finally set the seal of its approval upon the measure. Notwithstanding this prospective loss of revenue, parliament showed great reluctance to vote any new impost, although hardly a year previously it had sanctioned (30th June 1879) Depretis's scheme for spending during the next eighteen years £43,200,000 in building 5000 kilometres of railway, an expenditure not wholly justified by the importance of the lines, and useful principally as a source of electoral sops for the constituents of ministerial deputies. The unsatisfactory financial condition of the Florence, Rome and Naples municipalities necessitated state help, but the Chamber nevertheless proceeded with a light heart (23rd February 1881) to sanction the issue of a foreign loan for £56,000,000, with a view to the abolition of the forced currency, thus adding to the burdens of the exchequer a load which three years later again dragged Italy into the gulf of chronic deficit.

In no modern country is error or incompetence on the part of administrators more swiftly followed by retribution than in Italy; both at home and abroad she is hemmed in by political and economic conditions which leave little margin for folly, and still less for "mental and moral insufficiency," such as had been displayed by the Left. Nemesis came in the spring of 1881, in the form of the French invasion of Tunisia. Guiccioli, the biographer of Sella, observes that Italian politicians find it especially hard to resist "the temptation of appearing crafty." The men of the Left believed themselves subtle enough to retain the confidence and esteem of all foreign powers while coquetting at home with elements which some of these powers had reason to regard with suspicion. Italy, in constant danger from France, needed good relations with Austria and Germany, but could only attain the goodwill of the former by firm treatment of the revolutionary Irredentist agitators. This would have been easier if the decay of the German will and ability to cope with all anti-monarchical forces. Depretis and Cairoli did neither the one nor the other. Hence, when opportunity offered firmly to establish Italian predominance in the central Mediterranean by an occupation of Tunisia, they found themselves deprived of those confidential relations with the central powers, and even with Great Britain, which might have enabled them to use the opportunity to full advantage. The conduct of Italy in declining the suggestions received from Count Andrassy and General Ignatiev on the eve of the Russo-Turkish War—that Italy should seek compensation in Tunisia for the extension of Austrian sway in the Balkans—and in subsequently rejecting the German suggestion to come to an arrangement with Great Britain for the occupation of Tunisia as compensation for the British occupation of Cyprus, was certainly due to fear lest an attempt on Tunisia should lead to a war with France, for which Italy knew herself to be totally unprepared. This very unpreparedness, however, rendered still less excusable her treatment of the Irredentist agitation, which brought her within a hair's-breadth of a conflict with Austria. Although Cairoli, upon learning of the Anglo-Ottoman convention in regard to Cyprus, had advised Count Corti of the possibility that Great Britain might seek to placate France by conviving at a French occupation of Tunisia, neither he nor Count Corti had any inclination of the verbal arrangement made between Lord Salisbury and Waddington at the instance of Bismarck, that, when convenient, France should occupy Tunisia, an agreement afterwards confirmed (with a reserve as to the eventual attitude of Italy) in despatches exchanged in July and August 1878 between the Quai d'Orsay and Downing Street. Almost up to the moment of the French occupation of Tunisia the Italian government believed that Great Britain, if only out of gratitude for the bearing of Italy in connexion with the Dulegno demonstration in the autumn of 1878, would prevent French acquisition of the Harem. Ignorant of the assurance conveyed to France by Lord Granville that the Gladstone cabinet would respect the engagements of the Beaconsfield-Salisbury administration, Cairoli, in deference to Italian public opinion, endeavoured to neutralize the activity of the French consul Roustan by the appointment of an equally energetic Italian consul, Macciò. The rivalry between these two officials in Tunisia contributed not a little to strain Franco-Italian relations, but it is doubtful whether France would have precipitated her action had not General Menabrea, Italian ambassador in London, urged his government to purchase the Tunis-Goletta railway from the English company by which it had been constructed. A French attempt to purchase the line was upset in the English courts, and the railway was finally secured by Italy at a price more than eight times its real value. This pertinacity engendered a belief in Italy that France was about to undertake in Tunisia a more aggressive policy than necessary for the protection of her commercial interests. Roustan therefore hastened to extort from the key concessions calculated to neutralize the advantages which Italy had hoped to secure by the possession of the Tunis-Goletta line, and at the same time the French government prepared at Toulon an expeditionary corps for the occupation of the Regency. In the spring of 1881
the Kroumir tribe was reported to have attacked a French force on the Algerian border, and on the 6th of April Roustan informed the bey of Tunis that France would chastise the assailants. The bey issued futile protests to the powers. On the 26th of April the island of Tabarca was occupied by the French, Bizerta was seized on the 2nd of May, and on the 12th of May the bey signed the treaty of Bardo accepting the French protectorate. France undertook the maintenance of order in the Regency, and assumed the representation of Tunisia in all dealings with other countries.

Italian indignation at the French coup de main was the deeper on account of the apparent duplicity of the government of the Republic. On the 11th of May the French foreign minister, Barthélemy Saint Hilaire, had officially assured the Italian ambassador in Paris that France “had no thought of occupying Tunisia or any part of Tunisian territory, beyond some points of the Kroumir country.” This assurance, dictated by Jules Ferry to Barthélemy Saint Hilaire in the presence of the Italian ambassador, and by him telegraphed en clair to Rome, was considered a binding pledge that France would not materially alter the status quo in Tunisia. Documents subsequently published have somewhat attenuated the responsibility of Ferry and Saint Hilaire for this breach of faith, and have shown the French government to be the recipient of instructions from General Farre, minister of war in the Ferry cabinet, who pursued a policy diametrically opposed to the official declarations made by the premier and the foreign minister. Even had this circumstance been known at the time, it could scarcely have mitigated the intense resentment of the whole Italian nation at an event which was considered tantamount not only to the destruction of Italian aspirations to Tunisia, but to the ruin of the interests of the numerous Italian colony and to a constant menace against the security of the Sicilian and south Italian coasts.

Had the blow thus struck at Italian influence in the Mediterranean induced politicians to sink for a while their personal differences and to unite in presenting a firm front to foreign nations, the crisis in regard to Tunisia might not have been wholly unproductive of good. Unfortunately, on this, as on other critical occasions, deputies proved themselves incapable of common effort to promote general welfare. While excitement over Tunisia was at its height, but before the situation was irretrievably compromised to the disadvantage of Italy, Cairoi had been compelled to resign by a vote of want of confidence in the Chamber. The only politician capable of filling the office of his successor was Depretis, who had received instructions from General Farre. But even he was not trusted, and he too was compelled to resign. The reaction was strong, and the crown appealed. The faction leaders of the Left, though divided by personal jealousies and mutually incompatible ambitions, agreed that the worst evil which could befall Italy would be the return of the Right to power, and conspired to preclude the possibility of a Sella cabinet. An attempt by Depretis to re-compose the Cairoi ministry proved fruitless, and after eleven precious days had been lost, King Humbert was obliged, on the 19th of April 1881, to refuse Cairoi’s resignation. The conclusion of the treaty of Bardo on the 12th of May, however, compelled Cairoi to sacrifice himself to popular indignation. Again Sella was called upon, but again the dog-in-the-manger policy of Depretis, Cairoi, Nicotera and Baccarini, in conjunction with the intolerant attitude of some extreme Conservatives, proved fatal to his endeavours. Depretis then succeeded in recomposing the Cairoi cabinet without Cairoi, Mancini being placed at the foreign office. Except in regard to an increase of the army estimates, urgently demanded by public opinion, the new ministry had practically no programme. Public opinion was further irritated against France by the arrest and imprisonment of several Italian workmen at Marseilles on the occasion of the return of the French expedition from Tunisia, and Depretis, in response to public feeling, found himself obliged to mobilize a part of the militia for military exercises. In this condition of home and foreign affairs occurred disorders in Rome in connexion with the transfer of the remains of Pius IX. from St Peter’s to the basilica of San Lorenzo. Most of the responsibility lay with the Vatican, which had arranged the procession in the way best calculated to irritate Italian feeling, but little excuse can be offered for the failure of the Italian authorities to maintain public order. In conjunction with the occupation of Tunisia, the effect of these disorders was to exhibit Italy as a country powerless to defend its interests abroad or to keep peace at home. The scandal and the pressure of foreign Catholic opinion compelled Depretis to pursue a more energetic policy, and to publish a formal declaration of the intangibility of the Law of Guarantees.

Meanwhile a conviction was spreading that the only way of escape from the dangerous isolation of Italy lay in closer agreement with Austria and Germany. Depretis tardily recognized the need for such an agreement, if only to remove the “coldness and invincible difference” which, by subsequent confession of Mancini, then characterized the attitude of the central powers; but he was opposed to any formal alliance, lest it might arouse French resentment, while the new Franco-Italian treaty was still uncompleted, and the foreign loan for the abolition of the forced currency had still to be floated. He, indeed, was not disposed to concede to public opinion anything beyond an increase of the army, a measure insistently demanded by Garibaldi and the Left. The Right likewise desired to strengthen both army and navy, but advocated the conclusion of a joint Franco-Italian defensive treaty against French domineering, and as a pledge that Italy would be vouchsafed time to effect her armaments without disturbing financial equilibrium. The Right also hoped that closer accord with Germany and Austria would compel Italy to conform her home policy more nearly to the principles of order prevailing in those empires. More resolute than Right or Left was the Centre, a small group led by Sidney Sonnino, a young politician of unusual fibre, who sought in the press and in parliament to spread a conviction that the only sound basis for Italian policy would be close alliance with the central powers and a friendly understanding with Great Britain in regard to Mediterranean affairs. The principal Italian public men were divided in opinion on the subject of an alliance. Peruzzi, Lanza and Bonghi pleaded for equal friendship with all powers, and especially with France; Crispi, Minghetti, Cadorna and others, including Blanc, secretary-general to the foreign office, openly favoured a pro-Austrian policy. Austria and Germany, however, scarcely reciprocated these dispositions. The Irredentist agitation had left profound traces at Berlin and Vienna, and had given rise to a distrust of Depretis which nothing had yet occurred to allay. Nor, in view of the comparative weakness of Italian armaments, could eagerness to find an ally be deemed conclusive proof of the value of Italian friendship. Count di Roblant, Italian ambassador at Vienna, warned his government not to yield too readily to pro-Austrian pressure, lest the dignity of Italy be compromised, or her desire for an alliance be granted on onerous terms. Mancini, foreign minister, who was as anxious as Depretis for the conclusion of the Franco-Italian commercial treaty, gladly followed this advice, and limited his efforts to the maintenance of correct diplomatic relations with the central powers. Except in regard to the Roman question, the advantages and disadvantages of an Italian alliance with Austria and Germany counterbalanced each other. A rapPROCHEMENT with France and a continuance of the Irredentist movement could not fail to arouse Austro-German hostility; but, on the other hand, to draw near to the central powers would inevitably accentuate the difficulties of France. In the one hypothesis, as in the other, Italy could count upon the moral support of Great Britain, but by no means upon that of the other powers, for the British commercial policy. Apart from resentment against France on account of Tunisia there remained the question of the temporal power of the Pope to turn the scale in favour of Austria and Germany. Danger of foreign interference in the relations between Italy and the papacy had never been so great since the Italian occupation of Rome, as when, in the summer of 1881, the disorders during the transfer of the remains of Pius IX. had lent an unwonted ring of plausibility to the papal complaint concerning the "miserable" position of the Holy See. Bismarck at that moment had entered upon his "pilgrimage to Canossa," and was anxious to obtain from the

Berlin that whatever was done at Vienna would be regarded as having been done in the German capital. Nor did nascent irritation in France prevent the conclusion of the Franco-Italian commercial treaty, which was signed at Paris on the 3rd of November.

In Italy public opinion as a whole was favourable to the visit, especially as it was not considered an obstacle to the projected increase of the army and navy. Doubts, however, soon sprang up as to its effect upon the minds of Austrian statesmen, since on the 8th of November the language employed by Kállay and Count Andrásy to the Hungarian delegations on the subject of Irredentism was scarcely calculated to soothe Italian susceptibilities. But on 9th November the European situation was suddenly modified by the formation of the Gambratto cabinet, and, in view of the policy of revenge with which Gambetta was supposed to be identified, it became imperative for Bismarck to assure himself that Italy would not be enticed into a Franco-German alliance.

The political conditions of Europe favoured the realization of Italian desires. Growing rivalry between Austria and Russia in the Balkans rendered the continuance of the "League of the Three Emperors" a practical impossibility. The Austro-German alliance of 1879 formally guaranteed the territory of the contracting parties, but Austria could not count upon effective help from Germany in case of war, since Russian attack upon Austria would certainly have been followed by French attack upon Germany. As in 1869-1870, it therefore became a matter of the highest importance for Italy to retain full disposal of all her troops by assuring herself against Austrian aggression. The tsar, Alexander III., under the impression of the assassination of his father, desired, however, the renewal of the Dreikaiserbund, both as a guarantee of European peace and as a conservative league against revolutionary parties. The German emperor shared this desire, but Bismarck and the Austrian emperor wished to substitute for the imperial league some more advantageous combination. Hence a tacit understanding between Bismarck and Austria that the latter should prosper by Italian resentment against France to draw Italy into the orbit of the Austro-German alliance. For the moment Germany was to hold aloof lest any active initiative on her part should displeasure the Vatican, of whose help Bismarck stood in need.

At the beginning of August 1881 the Austrian press mooted the idea of a visit from King Humbert to the emperor Francis Joseph. Count di Robilant, anxious that Italy should not beg a smile from the central Powers, advised Mancini to receive with caution the suggestions of the Austrian press. Depretis took occasion to deny, in a form scarcely courteous, the probability of the visit. Robilant's opposition to a precipitate acceptance of the Austrian hint was founded upon fear lest King Humbert at Vienna might be pressed to disavow Irredentist aspirations, and upon a desire to arrange for a visit of the emperor Francis Joseph to Rome in return for King Humbert's visit to Vienna. Seeing the hesitation of the Italian government, the Austrian and German semi-official press redoubled their efforts to bring about the visit. By the end of September the idea had gained such ground in Italy that the visit was practically settled, and on the 7th of October Mancini informed Robilant (who was then in Italy) of the fact. Though he considered such precipitation impolitic, Robilant, finding that confidential information of Italian intentions had been conveyed to the Austrian government, sought an interview with King Humbert, and on the 17th of October started for Vienna to settle the conditions of the visit. Depretis, fearing to jeopardize the impending conclusion of the Franco-Italian commercial treaty, would have preferred the visit to take the form of an act of personal courtesy between sovereigns. The Austrian government, for its part, desired that the king should be accompanied by Depretis, though not by Mancini, lest the presence of the Italian foreign minister should lend to the occasion too marked a political character. Mancini, unable to brook exclusion, insisted, however, upon accompanying the king. King Humbert with Queen Margherita reached Vienna on the morning of the 27th of October, and stayed at the Hofburg until the 31st of October.

The visit was marked by the greatest cordiality. Count Robilant's fears of inopportune pressure with regard to Irredentism proving groundless. Both in Germany and Austria the visit was construed as a preliminary to the adhesion of Italy to the Austro-German alliance. Count Hatzfeldt, on behalf of the German Foreign Office, informed the Italian ambassador in
proved fruitless, since Kalnoky, somewhat Clerical-minded, was averse from guaranteeing the integrity of all Italian territory, and Mancini was equally unwilling to guarantee to Austria permanent possession of Trent and Trieste. Mancini, moreover, wished the treaty of alliance to provide for reciprocal protection of the chief interests of the contracting Powers, Italy undertaking to second Austria-Hungary in the Balkans, and Austria and Germany pledging themselves to support Italy in Mediterranean questions. Without some such proviso Italy would, in Mancini's opinion, be exposed single-handed to French resentment. At the request of Kalnoky, Mancini defined his proposal in a memorandum, but the illness of himself and Depretis, combined with an untoward discussion in the Italian press on the failure of the Austrian emperor to return in Rome King Humbert's visit to Vienna, caused negotiations to drag. The pope, it transpired, had refused to receive the emperor if he came to Rome on a visit to the Quirinal, and Francis Joseph, though anxious to return King Humbert's visit, was unable to offend the feelings of his Catholic subjects. Meanwhile (11th May 1882) the Italian parliament adopted the new Army Law involving a special credit of £1,500,000 for the creation of two new army corps by which the war footing of the regular army was raised to nearly 350,000 men and the ordinary military estimates to £8,000,000 per annum. Garibaldi, who, since the French occupation of Tunis, had ardently worked for the increase of the army, had thus the satisfaction of seeing his desire realized before his death at Caprera, on the 29th of June 1882. "In spirit a child, in character a man of classic mould," Garibaldi had remained the nation's idol, an almost legendary hero whose place none could aspire to fill. Gratitude for his achievements and sorrow for his death found expression in universal mourning wherein king and peasant equally joined. Before his death, and almost contemporaneously with the passing of the Army Bill, negotiations for the alliance were renewed. Encouraged from Berlin, Kalnoky agreed to the reciprocal territorial guarantee, but declined reciprocity in support of special interests. Mancini had therefore to be content with a declaration that the allies would act in mutually friendly intelligence. Depretis made some opposition, but finally acquiesced, and the treaty of triple alliance was signed on the 20th of May 1882, five days after the promulgation of the Franco-Italian commercial treaty in Paris. Though partial revelations have been made, the exact tenor of the treaty of triple alliance has never been divulged. It is known to have been concluded for a period of five years, to have pledged the contracting parties to join in resisting attack upon the territory of any one of them, and to have specified the military disposition to be adopted by each in case attack should come either from France, or from Russia, or from both simultaneously. The Italian General Staff is said to have undertaken, in the event of war against France, to operate with two armies on the north-western frontier against the French armée des Alpes, of which the war strength is about 250,000 men. A third Italian army would, if expedient, pass into Germany, to operate against either France or Russia. Austria undertook to guard the Adriatic on land and sea, and to help Germany by checking Russia on land. Germany would be sufficiently employed in carrying on war against two fronts. Kalnoky wished that both the terms of the treaty and the fact of its conclusion should remain secret, but Bismarck and Mancini hastened to hint at its existence, the former in the Reichstag on the 12th of June 1882, and the latter in the Italian semi-official press. A revival of Irredentism in connexion with the execution of an Austrian deserter named Oberdank, who after escaping into Italy endeavoured to return to Austria with explosive bombs in his possession, and the cordial references to France made by Depretis at Stradella (8th October 1882), prevented the French government from suspecting the existence of the alliance, or from ceasing to strive after a Franco-Italian understanding. Suspicion was not aroused until March 1883, when Mancini, in defending himself against strictures upon his refusal to co-operate with Great Britain in Egypt, practically revealed the existence of the treaty, thereby irritating France and destroying Depretis's secret hope of finding in the triple alliance the advantage of an Austro-German guarantee without the disadvantage of French enmity. In Italy the revelation of the treaty was hailed with satisfaction except by the Clericals, who were enraged at the blow thus struck at the restoration of the pope's temporal power, and by the Radicals, who feared both the inevitable breach with republican France and the reinforcement of Italian constitutional parties by intimacy with strong monarchical states such as Germany and Austria. These very considerations naturally combined to recommend the fact to constitutionalists, who saw in it, besides the territorial guarantee, the elimination of the danger of foreign interference in the relations between Italy and the Vatican, such as Bismarck had recently threatened and such as France was believed ready to propose.

Nevertheless, during its first period (1882-1887) the triple alliance failed to ensure cordiality between the contracting Powers. Mancini exerted himself in a hundred ways to soothe French resentment. He not only refused to join Great Britain in the Egyptian expedition, but agreed to the conclusion of an uncommercial convention in Tunis, which deprecated suspicion of French designs upon Morocco. His efforts were worse than futile. France remained cold, while Bismarck and Kalnoky, distrustful of the Radicals of Depretis and Mancini, assumed towards their ally an attitude almost hostile. Possibly Germany and Austria may have been influenced by the secret treaty signed between Austria, Germany and Russia on the 21st of March 1884, and ratified during the meeting of the three emperors at Skieruwice in September of that year, by which Bismarck, in return for "honest brokerage" in the Balkans, is understood to have obtained from Austria and Russia a promise of benevolent neutrality in case Germany should be "forced" to make war upon a fourth power—France. Guaranteed thus against Russian attack, Italy became in the eyes of the central powers a negligible quantity, and was treated accordingly. Though kept in the dark as to the Skieruwice arrangement, the Italian government soon discovered from the course of events that the triple alliance had practically lost its object, European peace having been assured without Italian co-operation. Meanwhile France provided Italy with fresh cause for uneasiness by abating her hostility to Germany. Italy in consequence drew nearer to Great Britain, and at the London conference on the Egyptian financial question sided with Great Britain against Austria and Germany. At the same time negotiations took place with Great Britain for an Italian occupation of Massawa, and Mancini, dreaming of a vast Anglo-Italian enterprise against the Mahdi, expatriated in the spring of 1885 upon the glories of an Anglo-Italian alliance, an indiscretion which drew upon him a scarcely-velled dementi from London. Again speaking in the Chamber, Mancini claimed for Italy the principal merit in the conclusion of the triple alliance, but declared that the alliance left Italy full liberty of action in regard to interests outside its scope, "especially as there was no possibility of obtaining protection for such interests from those who by the alliance had not undertaken to protect them." These words, which revealed the absence of any stipulation in regard to the protection of Italian interests in the Mediterranean, created lively dissatisfaction in Italy and corresponding satisfaction in France. They hastened Mancini's downfall (17th June 1885), and prepared the advent of count di Robilant, who three months later succeeded Mancini at the Italian Foreign Office. Robilant, for whom the Skieruwice pact was no secret, followed a firmly independent policy throughout the Bulgarian crisis of 1885-1886, declining to be drawn into any action beyond that required by the treaty of Berlin and the protection of Italian interests in the Balkans. Italy, indeed, came out of the Eastern crisis with enhanced prestige and with her relations to Austria greatly improved. Towards Prince Bismarck Robilant maintained an attitude of dignified independence, and as, in the spring of 1886, the moment for the renewal of the triple alliance drew near, he profited by the development of the Bulgarian crisis and the
threatened Franco-Russian understanding to secure from the central powers "something more" than the bare territorial guarantee of the original treaty. This "something more" consisted, at least in part, of the arrangement, with the help of Austria and Germany, of an Anglo-Italian naval understanding having special reference to the Eastern question, but providing for common action by the British and Italian fleets in the Mediterranean in case of war. A vote of the Italian Chamber on the 4th of February 1887, in connexion with the disaster to Italian troops at Dogali, in Abyssinia, brought about the resignation of the Depretis-Robilant cabinet. The crisis dragged for three months, and before its definitive solution by the formation of a Depretis-Crispi ministry, Robilant succeeded (17th March 1887) in renewing the triple alliance on terms more favourable to Italy than those obtained in 1882. Not only did he secure concessions from Austria and Germany corresponding in some degree to the improved state of the Italian army and navy, but, in virtue of the Anglo-Italian understanding, assured the practical adhesion of Great Britain to the European policy of the central powers, a triumph probably greater than any registered by Italian diplomacy since the completion of national unity.

The period between May 1881 and July 1887 occupied, in the region of foreign affairs, by the negotiation, conclusion and renewal of the triple alliance, by the Bulgarian crisis and by the dawn of an Italian colonial policy, was marked at home by urgent political and economic problems, and by the parliamentary phenomena known as trasformismo. On the 29th of June 1881 the Chamber adopted a Franchise Reform Bill, which increased the electorate from 60,000 to 2,000,000 by lowering the fiscal qualification from 40 to 19-50 lire in direct taxation, and by extending the suffrage to all persons who had passed through the two lower standards of the elementary schools, and practically to all persons able to read and write. The immediate result of the reform was to increase the political influence of large cities where the proportion of illiterate workmen was lower than in the country districts, and to exclude from the franchise numbers of peasants and small proprietors who, though of more conservative temperament and of better economic position than the artizan population of the large towns, were often unable to fulfil the scholarship qualification. On the 12th of April 1883 the forced currency was formally abolished by the resumption of treasury payments in gold with funds obtained through a loan of £1,350,000 issued in London on the 5th of May 1882. Owing to the hostility of the French market the loan was offered with difficulty, and, though the gold premium fell and exchanges improved temporarily facilitated by the resumption of cash payments, it is doubtful whether these advantages made up for the burden of £60,000,000 additional annual interest thrown upon the exchequer. On the 6th of March 1885 parliament finally sanctioned the conventions by which state railways were farmed out to three private companies—the Mediterranean, Adriatic and Sicilian. The railways redeemed in 1875-1876 had been worked in the interval by the government at a heavy loss. A commission of inquiry reported in favour of private management. The conventions, concluded for a period of sixty years, but terminable by either party after twenty or forty years, retained for the state the possession of the lines (except the southern railway, viz. the line from Bologna to Brindisi belonging to the Società Meridionale to whom the Adriatic lines were now farmed), but sold rolling stock to the companies, arranged various schedules of state subsidy for lines projected or in course of construction, guaranteed interest on the bonds of the companies and arranged for the division of revenue between the companies, the reserve fund and the state. National control of the railways was secured by a proviso that the directors must be of Italian nationality. Depretis and his colleague Genala, minister of public works, experienced great difficulty in securing parliamentary sanction for the conventions, not so much on account of their defective character, as from the opposition of local interests anxious to extort new lines from the government. In fact, the conventions were only voted by a majority of twenty-three votes after the government had undertaken to increase the length of new state-built lines from 1,500 to 2,500 kilometres. Unfortunately, the calculation of probable railway revenue on which the conventions had been based proved to be enormously exaggerated. For many years the 37.5% of the gross revenue (less the cost of maintaining the rolling stock, incumbent on the state) scarcely sufficed to pay the interest on debts incurred for railway construction and on the guaranteed bonds. Gradually the increase of traffic consequent upon the industrial development of Italy decreased the annual losses of the state, but the position of the government in regard to the railways still remained so unsatisfactory as to render the resumption of the whole system by the state on the expiration of the first period of twenty years in 1905 inevitable. Intimately bound up with the forced currency, the railway conventions and public works was the financial question in general. From 1876, when equilibrium between expenditure and revenue had first been attained, taxation yielded steady annual surpluses, which in 1881 reached the satisfactory level of £2,120,000. The gradual abolition of the old internal taxes diminished the surplus in 1882 to £236,000, and in 1883 to £110,000, while the total repeal of the old internal taxes on wheat, which took effect on the 1st of January 1884, coincided with the opening of a new and disastrous period of deficit. True, the repeal of the old internal tax was not the only, nor possibly even the principal, cause of the deficit. The policy of "fiscal transformation" inaugurated by the Left increased revenue from indirect taxation from £17,000,000 in 1876 to more than £2,400,000 in 1887, by substituting heavy corn duties for the old tax, and by raising the sugar and petroleum duties to unprecedented levels. But partly from lack of firm financial administration, partly through the increase of military and naval expenditure (which in 1887 amounted to £50,000,000 for the army, while special efforts were made to strengthen the navy), and principally through the constant drain of railway construction and public works, the demands upon the exchequer grew largely to exceed the normal increase of revenue, and necessitated the contraction of new debts. In their anxiety to remain in office Depretis and the finance minister, Magliani, never hesitated to mortgage the financial future of their country. No concession could be denied to deputies, or groups of deputies, whose support was indispensable to the life of the cabinet, nor, under such conditions, was it possible to place any effective check upon administrative abuses in which politicians and the electors were interested. Large sums which contractors had undertaken to construct for reasonable amounts were frequently made to cost thrice the original estimates. Minghetti, in a treachant exposure of the parliamentary condition of Italy during this period, cites a case in which a credit for certain public works was, during a debate in the Chamber, increased by the government from £6,600,000 to £9,000,000 in order to conciliate local political interests. In the spring of 1887 Genala, minister of public works, was taken to task for having sanctioned expenditure of £80,000,000 on railway construction weIl only £40,000,000 had been included in the estimates. As most of these credits were spread over a series of years, succeeding administrations found their financial liberty of action destroyed, and were obliged to cover deficit by constant issues of consolidated stock. Thus the deficit of £540,000 for the financial year 1885-1886 rose to nearly £3,920,000 in 1887-1888, and in 1889-1889 attained the terrible level of £9,400,000.

Nevertheless, in spite of many and serious shortcomings, the long series of Depretis administrations was marked by the adoption of some useful measures. Besides the realization of the formal programme of the Left, consisting of the repeal of the old internal taxes, the abolition of the forced currency, the extension of the suffrage and the development of the railway system, Depretis laid the foundation for land tax re-assessment by introducing a new cadastral survey. Unfortunately, the new survey was made largely optional, so that provinces which had reason
to hope for a diminution of land tax under a revised assessment
fastened to complete their survey, while others, in which the
average of the land tax was below a normal rate, by
neglected to comply with the provisions of the scheme. An
important undertaking, known as the Agricultural Inquiry,
brought to light vast quantities of information valuable for
future agrarian legislation. The year 1870 saw the introduction
and adoption of a measure embodying the principle of employers'
liability for accidents to workmen, a principle subsequently
extended and more equitably defined in the spring of 1890.
An effort to encourage the development of the mercantile marine
was made in the same year, and a convention was concluded
with the chief lines of passenger steamers to retain their fastest
vessels as auxiliaries to the fleet in case of war. Sanitation and
public hygiene received a potent impulse from the cholera
epidemic of 1884, many of the unhealthiest quarters in Naples
and other cities being demolished and rebuilt, with funds chiefly
furnished by the state. The movement was strongly supported
by King Humbert, whose intrepidity in visiting the most
dangerous spots at Busca and Naples while the epidemic was
at its height, reassuring the panic-stricken inhabitants by his
presence, elicited the enthusiasm of his people and the admiration
of Europe.

During the accomplishment of these and other reforms the
condition of parliament underwent profound change. By degrees
the administrations of the Left had ceased to rely
solely upon the Liberal sections of the Chamber, and
had carried their most important bills with the help of
the Right. This process of transformation was not exclusively
the work of Depretis, but had been initiated as early as 1873,
when a portion of the Right under Minghetti had, by joining
the Left, overturned the Lanza-Sella cabinet. In 1876 Minghetti
himself had fallen a victim to a similar defection of Conservative
departments. The practical annihilation of the old Right in the
elections of 1876 opened a new parliamentary era. Reduced in
class to less than one hundred, and radically changed in spirit
and composition, the Right gave way, if not to despair, at least
to a despondency unsuited to an opposition party. Though on
more than one occasion personal rancour against the men of
the Moderate Left prevented the Right from following Sella's
advice and regaining, by timely coalition with cognate political
elements, a portion of its former influence, the bulk of
the party, with singular inconsistency, drew nearer and nearer
to the Liberal cabinets. The process was accelerated by Sella's
illness and death (14th March 1884), an event which cast profound
discouragement over the more thoughtful of the Conservatives
and Moderate Liberals, by whom Sella had been regarded as a
supreme political reserve, as a statesman whose experienced
evocation and patriotic sagacity might have been trusted to lift
Italy from any depth of folly or misfortune. By a strange
anomaly the Radical measures brought forward by the Left
diminished instead of increasing the distance between it and the
Conservatives. Numerically insufficient to reject such measures,
and lacking the fibre and the cohesion necessary for the pursuance
of a far-sighted policy, the Right thought prudent not to employ
itself in a uncompromising opposition, but to maintain a
propitious government, in order to endeavour to modify Radical
legislation in a Conservative sense. In every case the calculation proved
fallacious. Radical measures were passed unmodified, and the
Right was compelled sadly to accept the accomplished fact.
Thus it was with the abolition of the gift tax, the reform of the
suffrage, the railway conventions and many other bills. When,
in course of time, the extended suffrage increased the Republican
and Extreme Radical elements in the Chamber, and the Liberal
"Pentarchy" (composed of Crispi, Cairoli, Nicotera, Zanardelli
and Baccarini) assumed an attitude of bitter hostility to Depretis,
the Right, obeying the impulse of Minghetti, rallied openly
to Depretis, lending him aid without which his prolonged term
of office would have been impossible. The result was para-
mental chaos, baptized trasformismo. In May 1883 this process
received official recognition by the elimination of the Radicals
Zanardelli and Baccarini from the Depretis cabinet, while in
the course of 1884 a Conservative, Signor Blanchieri, was elected
to the presidency of the Chamber, and another Conservative,
General Ricotti, appointed to the War Office. Though Depretis,
at the end of his life in 1887, showed signs of repenting of the
confusion thus created, he had established a parliamentary
system destined largely to sterilize and vitiate the political life of
Italy.

Contemporaneously with the vicissitudes of home and foreign
policy under the Left there grew up in Italy a marked tendency
towards colonial enterprise. The tendency itself dated from
1869, when a congress of the Italian chambers of commerce at Genoa had urged the Lanza cabinet to
establish a commercial depot on the Red Sea. On the 11th of
March 1870 an Italian shipper, Signor Rubattino, had bought the
bay of Assab, with the neighbouring island of Darmakieh, from
Beheran, sultan of Raheita, for £18,00, the funds being furnished
by the government. The Egyptian government being unwilling
to recognize the sovereignty of Beheran over Assab or his right
to sell territory to a foreign power, Visconti-Venosta thought it
opportun to not then to occupy Assab. No further step was taken
until, at the end of 1879, Rubattino prepared to establish a
commercial station at Assab. The British government, however,
urged inquiry as to his intentions, and on the 19th of April 1880
received a formal undertaking from Cairo that Assab would
never be fortified nor be made a military establishment. Mean-
while (January 1880) stores and materials were landed, and Assab
was permanently occupied. Eighteen months later a party of Italian
sailors and explorers under Lieutenant Biglieri and Signor Giulietti were massacred in Egyptian territory. Egypt,
however, refused to make thorough inquiry into the massacre,
and was only prevented from occupying Raheita and coming into
conflict with Italy by the good offices of Lord Granville,
who dissuaded the Egyptian government from enforcing its
sovereignty. On the 20th of September 1881 Beheran formally
accepted Italian protection, and in the following February an
Anglo-Italian convention established the Italian title to Assab
on condition that Italy should formally recognize the suzerainty
of the Porte and of the khedive over the Red Sea coast, and
should prevent the transport of arms and munitions of war
through the territory of Assab. This convention was never
recognized by the Porte nor by the Egyptian government. A
month later (10th March 1882) Rubattino made over his establish-
ment to the Italian government, and on the 12th of June the
Chamber adopted a bill constituting Assab an Italian crown
colony.

Within four weeks of the adoption of this bill the bombardment of
Alexandria by the British fleet (11th July 1882) opened an
era destined profoundly to affect the colonial position of
Italy. The revolt of Arabi Pasha (September 1881)
led to the meeting of an ambassadorial conference
at Constantinople, promoted by Mancini, Italian
minister for foreign affairs, in the hope of preventing European
intervention in Egypt and the permanent establishment of an
Anglo-French condominium to the detriment of Italian influence.
At the opening of the conference (23rd June 1882) Italy secured
the recognition of its rights in Assab, and a treaty was entered
into by which the great powers undertook to avoid isolated action; but the rapid develop-
ment of the crisis in Egypt, and the refusal of France to co-operate
with Great Britain in the restoration of order, necessitated
vigorous action by the latter alone. In view of the French
refusal, Lord Granville on the 27th of July invited Italy to join
in restoring order in Egypt, but Mancini and Depretis, in
spite of the efforts of Crispi, then in London, declined the
offer. Financial considerations, lack of proper transports for an
expeditionary corps, fear of displeasing France, dislike of a
"policy of adventure," misplaced deference towards the ambassa-
dorial conference in Constantinople, and unwillingness to thwart
the current of Italian sentiment in favour of the Egyptian
"nationalists," were the chief motives of the Italian refusal,
which had the effect of somewhat estranging Great Britain and
Italy. Anglo-Italian relations, however, regained their normal
cordiality two years later, and found expression in the support

\textbf{Colonial policy.}
lent by Italy to the British proposal at the London conference on the Egyptian question (July 1884). About the same time Mancini was informed by the Italian agent in Cairo that Great Britain would be well disposed towards an extension of Italian influence on the Red Sea coast. Having sounded Lord Granville, Mancini received encouragement to seize Beulil and Massawa, in view of the projected restriction of the Egyptian zone of military occupation consequent on the Mahdist rising in the Sudan. Lord Granville further inquired whether Italy would co-operate in pacifying the Sudan, and received an affirmative reply. Italian action was hastened by news that, in December 1881, an exploring party under Signor Bianchi, royal commissioner for Assab, had been massacred in the Aussa (Danakil) country, an event which aroused in Italy a desire to punish the assassins and to obtain satisfaction for the still unpunished massacre of Signor Giulietti and his companions. Partly to satisfy public opinion, partly in order to profit by the favourable disposition of the British government, and partly in the hope of remedying the error committed in 1882 by refusal to co-operate with Great Britain in Egypt, the Italian government in January 1883 despatched an expedition under Signor Caiami and Colonel Sulta to occupy Massawa and Beulil. The occupation, effected on the 5th of February, was accelerated by fear lest Italy might be forestalled by France or Russia, both of which powers were suspected of desiring to establish themselves firmly on the Red Sea and to exercise a protectorate over Abyssinia. News of the occupation reached Europe simultaneously with the tidings of the fall of Khartum, an event which disappointed Italian hopes of military co-operation with Great Britain in the Sudan. The resignation of the Gladstone-Granville cabinet further precluded the projected Italian occupation of Suakin, and the Italians, wisely refraining from an independent attempt to succour Kassala, then besieged by the Mahdists, bent their efforts to the increase of their zone of occupation around Massawa. The extension of the Italian zone excited the suspicions of John, negus of Abyssinia, whose apprehensions were assiduously fomented by Alula, ras of Tigré, and by French and Greek adventurers. Measures, apparently successful, were taken to reassure the negus, but shortly afterwards protection insufficiently accorded by Italy to enemies of Ras Alula, induced the Abyssinians to enter upon hostilities. In January 1886 Ras Alula raided the village of Wà, to the west of Zula, but towards the end of the year (23rd November) Wà was occupied by the irregular troops of General Genè, who had superseded Colonel Saletta at Massawa. Angered by this step, Ras Alula took prisoners the members of an Italian exploring party commanded by Count Salimbene, and held them as hostages for the evacuation of Wà. General Genè nevertheless reinforced Wà and pushed forward a detachment to Saati. On the 25th of January 1887 Ras Alula attacked Saati, but was repulsed with loss. On the following day, however, the Abyssinians succeeded in surprising, near the village of Dogali, an Italian force of 524 officers and men under Colonel De Cristoforis, who were conveying provisions to the garrison of Saati.

The Abyssinians, 20,000 strong, speedily overwhelmed the small Italian force, which, after exhausting its ammunition, was destroyed where it stood. One man only escaped. Four hundred and seven men and twenty-three officers were killed outright, and one officer and eighty-one men wounded. Dead and wounded alike were horribly mutilated by order of Alula. Fearing a new attack, General Genè withdrew his forces from Saati, Wà and Arafal; but the losses of the Abyssinians at Saati and Dogali had been so heavy as to dissuade Alula from further hostilities.

In Italy the disaster of Dogali produced consternation, and caused the fall of the Depretis-Robbial cabinet. The Chamber, eager for revenge, voted a credit of £200,000, and sanctioned the despatch of reinforcements. Meanwhile Signor Crispì, who, though averse from colonial adventure, desired to vindicate Italian honour, entered the Depretis cabinet as minister of the interior, and obtained from parliament a new credit of £500,000. In November 1887 a strong expedition under General di San Marzano raised the strength of the Massawa garrison to nearly 20,000 men. The British government, desirous of preventing an Italo-Abyssinian conflict, which could but strengthen the position of the Mahdists, despatched Mr (afterwards Sir) Gerald Portal from Massawa on the 29th of October to mediate with the negus. The mission proved fruitless. Portal returned to Massawa on the 25th of December 1887, and warned the Italians that John was preparing to attack them in the following spring with an army of 100,000 men. On the 28th of March 1888 the negus indeed descended from the Abyssinian high plateau in the direction of Saati, but finding the Italian position too strong to be carried by assault, temporized and opened negotiations for peace. His tactics failed to entice the Italians from their position, and on the 3rd of April sickness among his men compelled John to withdraw the Abyssinian army. The negus next marched against Menelek, king of Shoa, whose neutrality Italy had purchased with 3000 Remington rifles and a supply of ammunition, but found him with 80,000 men too strongly entrenched to be successfully attacked. Tidings of a new Mahdist incursion into Abyssinian territory reaching the negus induced him to postpone the settlement of his quarrel with Menelek until the dervishes had been chastised. Marching towards the Blue Nile, he joined battle with the Mahdists, but on the 10th of March 1889 was killed, in the hour of victory, near Gallabat. His death gave rise to an Abyssinian war of succession between Mangashá, natural son of John, and Menelek, grandson of the Negus Sellà-Sellässié. Menelek, by means of Count Antonelli, resident in the Shoa country, requested Italy to execute a diversion in his favour by occupying Asmara and other points on the high plateau. Antonelli profited by the situation to obtain Menelek's signature to a treaty fixing the frontiers of the Italian colony and defining Italo-Abyssinian relations. The treaty, signed at Uccialli on the 2nd of May 1890, arranged for regular intercourse between Italy and Abyssinia and conceded to Italy a portion of the high plateau, with the positions of Halai, Saganeiti and Asmara. The main point of the treaty, however, lay in clause 17:—

"His Majesty the king of kings of Ethiopia consents to make use of the government of His Majesty the king of Italy for the treatment of all questions concerning other powers and governments."

Upon this clause Italy founded her claim to a protectorate over Abyssinia. In September 1889 the treaty of Uccialli was ratified in Italy by Menelek's lieutenant, the Ras Makonnen. Makonnen further concluded with the Italian premier, Crispì, a convention whereby Italy recognized Menelek as emperor of Ethiopia, Menelek recognized the Italian colony, and arranged for a special Italo-Abyssinian currency and for a loan. On the 11th of October Italy communicated article 17 of the treaty of Uccialli to the European powers, interpreting it as a valid title to an Italian protectorate over Abyssinia. Russia alone neglected to take note of the communication, and persisted in the hostile attitude she had assumed at the moment of the occupation of Massawa. Meanwhile the Italian mint coined thalers bearing the portrait of King Humbert, with an inscription referring to the Italian protectorate, and on the 1st of January 1890 a royal decree confirmed upon the colony the name of "Eritrea."

In the colony itself General Baldisserà, who had replaced General Saletta, delayed the movement against Mangashá desired by Menelek. The Italian general would have preferred to wait until his intervention was requested by both pretenders to the Abyssinian throne. Pressed by the home government, he, however, instructed a native ally to occupy the important positions of Keren and Asmara, and prepared himself to take the offensive against Mangashá and Ras Alula. The latter retreated south of the river Mareb, leaving the whole of the cis-Mareb territory, including the provinces of Hamesen, Agameh, Serah, and Okulé-Kusai, in Italian hands. General Orco, successor of Baldisserà, pushed offensive action more vigorously, and on the 26th of January 1900 entered Adowa, a city considerably to the south of the Mareb—an imprudent step which aroused Menelek's suspicions, and had hurriedly to be retraced. Mangashá, seeing further resistance to be useless, submitted to Menelek, who at the end
of February ratified at Makallé the additional convention to the treaty of Ucciali, but refused to recognize the Italian occupation of the Mareb. The negus, however, conformed to article 17 of the treaty of Ucciali by requesting Italy to represent Abyssinia at the Brussels anti-slavery conference, an act which strengthened Italian illusions as to Menelek's readiness to submit to their protectorate. Menelek had previously notified the chief European powers of his coronation at Entotto (14th December 1889), but Germany and Great Britain replied that such notification should have been made through the Italian government. Germany, moreover, rewarded Menelek's pride by employing merely the title of "highness." The negus took advantage of the incident to protest against the Italian text of article 17, and to contend that the Amharic text contained no equivalent for the word "consent," but merely stipulated that Abyssinia "might" make use of Italy in her relations with foreign powers. On the 28th of October 1890 Count Antonelli, negotiator of the treaty, was despatched to Khartum to protest against the arrival at Adis Ababa, the new residence of the negus, found agreement impossible either with regard to the frontier or the protectorate. On the 10th of April 1891, Menelek communicated to the powers his views with regard to the Italian frontier, and announced his intention of re-establishing the ancient boundaries of Ethiopia as far as Khartum to the north-west and Victoria Nyanza to the south. Meanwhile the marquis de Rudini, who had succeeded Crispi as Italian premier, had authorized the abandonment of article 17 even before he had heard of the failure of Antonelli's negotiations. Rudini was glad to leave the whole dispute in abeyance and to make with the local ras, or chieftains, of the high plateau an arrangement securing for Italy the cis-Mareb provinces of Seraé and Okulé-Kusai under the rule of an allied native chief named Bath-Agos. Rudini, however, was able to conclude two protocols with Great Britain (March and April 1891) whereby the British government defined Abyssinia as lying within the orbit of Italian influence and, in the event of the negus' death, was to be restored to the rightful domain. More important than all was the interest of the Roman curia, composed almost exclusively of Italians, to retain in its own hands the choice of the pontiff and to maintain the predominance of the Italian element and the Italian spirit in the ecclesiastical hierarchy. Conciliation with Italy would expose the pope and his Italian entourage to suspicion of being unduly subject to Italian political influence—of being, in a word, more Italian than Catholic. Such a suspicion would inevitably lead to a movement in favour of the inter- nationalization of the papal states, in order to avoid this danger it was therefore necessary to refuse all compromise, and, by perpetual reiteration of a claim incompatible with Italian territorial unity, to prove to the church at large that the pope and the curia were more Catholic than Italian. Such rigidity of principle need not be extended to the affairs of everyday contact between the Vatican and the Italian authorities, with regard to which, indeed, a tacit modus vivendi was easily attainable. Italy, for her part, could not go back upon the achievements of the Risorgimento by restoring Rome or any portion of Italian territory to the pope. She had hoped by conciliation to arrive at an understanding which should have ranged the church among the conservative and not among the disruptive forces of the country, but she was keenly desirous to retain the papacy as a preponderatingly Italian institution, and was ready to make whatever formal concessions might have been necessary to give faith to the idea of conciliation. The foreign ministers of the cardinals, had spoken of Italy in terms of unusual cordiality, and had expressed a wish for peace. A few days later Signor Bonghi, one of the framers of the Law of Guarantees, published in the Nuova Antologia a plea for reconciliation on the basis of an amendment to the Law of Guarantees and recognition by the pope of the Italian title to Rome. The chief incident of the movement towards conciliation consisted, however, in the publication of a pamphlet entitled La Conciliazione by Father Tosti, a close friend and confidant of the pope, extolling the advantages of peace between Vatican and Quirinal. Tosti's pamphlet was known to represent papal ideas, and Tosti himself was persona grata to the Italian government. Reconciliation seemed within sight when suddenly Tosti's pamphlet was placed on the Index, ostensibly on account of a phrase, "The whole of Italy entered Rome by the Porta Pia; the king cannot restore Rome to the pope, since Rome belongs to the Italian people." On the 4th of June 1887 the official Vatican organ, the Osservatore Romano, published a letter written by Tosti to the pope conditionally retracting the views expressed in the pamphlet. The letter had been written at the pope's request, on the understanding that it should not be published. On the 15th of June the pope addressed to Cardinal Rampolla del Tindaro, secretary of state, a letter reiterating in uncompromising terms the papal claim to the temporal power, and at the end of July Cardinal Rampolla reformulated the same claim in a circular to the papal nuncios abroad. The dream of conciliation was at an end, but the Tosti incident had served once more to illustrate the true position of the Vatican in regard to Italy. It became clear that neither the influence of the regular clergy, of which the Society of Jesus is the most powerful embodiment, nor that of foreign clerical parties, which largely control the Peter's Pence fund, would ever permit renunciation of the papal claim to temporal power. France, and the French Catholics especially, feared less conciliation should diminish the reliance of the Vatican upon France, and consequently French hold over the Vatican. The Vatican, for its part, felt its claim to temporal power to be too valuable a pecuniary asset, and too essential a instrument of church discipline lightly to be thrown away. The legend of an "imprisoned pope," subject to every whim of his gaolers, had never failed to arouse the pity and loosen the purse-strings of the faithful; dangerous innovators and would-be reformers within the church could be compelled to bow before the symbol of the temporal power, and their spirit of submission tested by their readiness to forgo the realization of their aims until the head of the church should be restored to his rightful domain. The internal situation inherited by Crispi from Depretis was very unsatisfactory. Extravagant expenditure on railways and public works, loose administration of finance, the cost of colonial enterprise, the growing demands for the army and navy, the impending tariff war with France, and the over-speculation in building and in industrial ventures, which had absorbed all the floating capital of the country, had combined to produce a state of affairs calling for firm and radical treatment. Crispi, burdened by the premiership and by the two most important portfolios in the cabinet, was, however, unable to exercise efficient control over all departments of state. Nevertheless his administration was by no means unfruitful. Zanardelli,
minister of justice, secured in June 1888 the adoption of a new penal code; state surveillance was extended to the opere pie, or charitable institutions; municipal franchise was reformed by granting what was practically manhood suffrage with residential qualification, provision being made for minority representation; and the national administration was reformed by a bill fixing the number and functions of the various ministries. The management of finance was scarcely satisfactory, for though Giolitti, who had succeeded Magliani and Perazzi at the treasury, suppressed the former's illusory “pension fund,” he lacked the fibre necessary to deal with the enormous deficit of nearly £10,000,000 in 1888-1889, the existence of which both Perazzi and he had recognized. The most successful feature of Crispi’s term of office was his strict maintenance of order and the suppression of Radical and Irredentist agitation. So convinced was he of the treatment of Irredentism that he dismissed without warning his colleague Seismit Doda, minister of finance, for having failed to protest against Irredentist speeches delivered in his presence at Udine. Firmness such as this secured for him the support of all constitutional elements, and after three years’ premiership his position was infinitely stronger than at the outset. The general election of 1890 gave the cabinet an almost unwieldy majority, comprising four-fifths of the Chamber. A lengthy term of office seemed to be opening out before him when, on the 31st of January 1891, Crispi, speaking in a debate on an unimportant bill, angrily rebuked the Right for its noisy interruptions. The rebuke infuriated the Conservative deputies, who, protesting against Crispi’s words in the name of the sacred memories of their party, precipitated a division and placed the cabinet in a minority. The incident, which was due to chance or guile, brought about the resignation of Crispi. A few days later he was succeeded in the premiership by the marquis di Rudini, leader of the Right, who formed a coalition cabinet with Nicotera and a part of the Left.

The sudden fall of Crispi brought a great change in the character of Italian relations with foreign powers. His policy had been characterized by extreme cordiality towards Austria and Germany, by a close understanding with Great Britain in regard to Mediterranean questions, and by an apparent animosity towards France, which at one moment seemed likely to lead to war. Shortly before the fall of the Depretis-Roblant cabinet Count Roblant had announced the intention of Italy to denounced the commercial treaties with France, which were based on the London Convention of 1887, and had intimated his readiness to negotiate new treaties. On the 24th of June 1889, in view of a possible rupture of commercial relations with France, the Depretis-Crispi cabinet introduced a new general tariff. The probability of the conclusion of a new Franco-Italian treaty was small, both on account of the protectionist spirit of France and of French resentment at the renewal of the triple alliance, but even such slight probability vanished after a visit paid to Bismarck by Crispi (October 1887) within three months of his appointment to the premiership. Crispi entertained no a priori animosity towards France, but was strongly convinced that Italy must emancipate herself from the position of political dependence on her powerful neighbour which had vitiated the foreign policy of the Left. So far was he from desiring to make war with France which he feared than on December 3, 1887, and had intimated his readiness to negotiate new treaties. The 24th of June 1889, in view of a possible rupture of commercial relations with France, the Depretis-Crispi cabinet introduced a new general tariff. The probability of the conclusion of a new Franco-Italian treaty was small, both on account of the protectionist spirit of France and of French resentment at the renewal of the triple alliance, but even such slight probability vanished after a visit paid to Bismarck by Crispi (October 1887) within three months of his appointment to the premiership. Crispi entertained no a priori animosity towards France, but was strongly convinced that Italy must emancipate herself from the position of political dependence on her powerful neighbour which had vitiated the foreign policy of the Left. So far was he from desiring to make war with France which he feared than on December 3. In his speeches at Turin, in which, while professing sentiments of friendship and esteem for France, he eulogized the personality of Bismarck, aroused against him a hostility on the part of the French which he was never afterwards able to allay. France was equally careless of Italian susceptibilities, and in April 1888 Giolitti made a futile but irritating attempt to enforce at Massawa the Ottoman regime of the capitulations in regard to non-Italian residents. In such circumstances the negotiations for the new commercial treaty could but fail, and though the old treaty was prolonged by special arrangement for two months, differential tariffs were put in force on both sides of the frontier on the 29th of February 1888. The value of French exports into Italy decreased immediately by one-half, while Italian exports to France decreased by nearly two-thirds. At the end of 1889 Crispi abolished the differential duties against French imports and returned to the general Italian tariff, but France declined to follow his lead and maintained her prohibitive duties. Meanwhile the enthusiastic reception accorded to the young German emperor on the occasion of his visit to Rome in October 1888, and the cordiality shown towards King Humbert and Crispi at Berlin in May 1889, increased the tension of Franco-Italian relations; nor was it until after the fall of Prince Bismarck in March 1890 that Crispi adopted towards the Republic a more friendly attitude by sending an Italian squadron to salute President Carnot at Toulon. The chief advantage derived by Italy from Crispi’s foreign policy was the increase of confidence in her government on the part of her allies and of Great Britain. On the occasion of the incident raised by Giolitti with regard to Massawa, Bismarck made it clear to France that, in case of complications, Italy would not stand alone; and when in February 1888 a strong French fleet appeared to menace the Italian coast, the British Mediterranean squadron demonstrated its readiness to support Italian naval dispositions. Moreover, under Crispi’s hand Italy awoke from the apathy of former years and gained consciousness of her place in the world. The conflict with France, the operations in Eritrea, the rigorous interpretation of the triple alliance, the questions of Morocco and Bulgaria, were all used by him as means to stimulate national sentiment. With the instinct of a true statesman, he felt the pulse of the people, divined their need for prestige, and their preference for a government heavy-handed rather than lax. How great had been Crispi’s power was seen by contrast with the policy of the Rudini cabinet which succeeded him in February 1891. Crispi’s so-called “megalomania” gave place to retrenchment in home affairs and to a deferential attitude towards all foreign powers. The premiership of Rudini was hailed by the Radical leader, Cavallotti, as a pledge of the non-renewal of the triple alliance, against which the Radicals began a vociferous campaign. Their tactics, however, produced a contrary effect, for Rudini, accepting proposals from Berlin, renewed the alliance in June 1891 for a period of twelve years. None of Rudini’s public utterances justified the supposition that he assumed office with the intention of allowing the alliance to lapse on its expiry in May 1897, as had been declared earlier by his predecessor, foreign policy. The attitude of several of his colleagues was more equivocal, but though they coquetted with French financiers in the hope of obtaining the support of the Paris Bourse for Italian securities, the precipitate renewal of the alliance destroyed all probability of a close understanding with France. The desire of Rudini to live on the best possible terms with all powers was further evinced in the course of a visit paid to Monza by M. de Giers in October 1891, when the Russian statesman was apprised of the entirely defensive nature of Italian engagements under the triple alliance. At the same time he carried to a successful conclusion negotiations begun by Crispi for the renewal of commercial treaties with Austria and Germany upon terms which to some extent compensated Italy for the reduction of her influence in Africa. In home affairs his administration was weak and vacillating, nor did the economies effected in naval and military expenditure and in other departments suffice to strengthen the position of a cabinet which had disappointed the hopes of its supporters. On the 14th of April 1892 dissensions between ministers concerning the financial programme led to a cabinet crisis, and though Rudini succeeded in reconstructing his administration, he was defeated in the Chamber on the 4th of May and obliged to resign. King Humbert, who, from lack of confidence in Rudini, had declined to allow him to dissolve parliament, entrusted Signor Giolitti, a Piedmontese deputy, sometime treasury minister in the Crispi cabinet, with the formation of a ministry of
the Left, which contrived to obtain six months’ supply on account, and dissolved the Chamber.

The ensuing general election (November 1892), marked by unprecedented violence and abuse of official pressure upon the electorate, fitly ushered in what proved to be the most unfortunate period of Italian history since the completion of national unity. The influence of Giolitti was based largely upon the favour of a court clique, and especially of Rattazzi, minister of the royal household. Early in 1893 a scandal arose in connexion with the management of state banks, and particularly of the Banca Romana, whose managing director, Tanlongo, had issued £2,500,000 of duplicate bank-notes. Giolitti scarcely improved matters by creating Tanlongo a member of the senate, and by denying in parliament the existence of any mismanagement. The senate, however, manifested the utmost hostility to Tanlongo, whom Giolitti, in consequence of an interpellation in the Chamber, was compelled to arrest. Arrests of other prominent persons followed, and on the 3rd of February the Chamber authorized the prosecution of De Zerbi, a Neapolitan deputy accused of corruption. On the 20th of February De Zerbi suddenly expired. For a time Giolitti successfully opposed inquiry into the conditions of the state banks, but on the 21st of March was compelled to establish a commission of inquiry of seven members. On the 23rd of November the report of the commission was read in the Chamber amid intense excitement. It established that all Italian cabinets since 1880 had grossly neglected the state banks; that the two preceding cabinets had been aware of the irregularities committed by Tanlongo; that Tanlongo had heavily subsidized the press, paying as much as £20,000 for that purpose in 1888 alone; that a number of deputies, including several ex-ministers, had received from him loans of a considerable amount, which they had apparently made no effort to refund; that Giolitti had deceived the Chamber with regard to the state banks, and was open to suspicion of having, after the arrest of Tanlongo, abstracted a number of documents from the latter’s papers before placing the remainder in the hands of the judicial authorities. In spite of the gravity of the charges formulated against many prominent men, the report merely “deplored” and “disapproved” of their conduct, without proposing penal proceedings. Fear of extending still further a scandal which had already attained huge dimensions, and the desire to avoid any further shock to national credit, caused the commissioners of the expository commission to avoid a long series of prosecutions. The report, however, sealed the fate of the Giolitti cabinet, and on the 24th of November it resigned amid general execration.

Apart from the lack of scruple manifested by Giolitti in the bank scandals, he exhibited incompetence in the conduct of foreign and home affairs. On the 16th and 18th of August 1893 a number of Italian workmen were massacred at Aigues-Mortes. The French authorities, under whose eyes the massacre was perpetrated, did nothing to prevent or repress it, and the mayor of Marseilles, even refused to admit the wounded Italian workmen to the municipal hospital. These occurrences provoked anti-French demonstrations in many parts of Italy, and revived the chronic Italian rancour against France. The Italian foreign minister, Brin, began by demanding the punishment of the persons guilty of the massacre, but hastened to accept as satisfactory the anodyne measures adopted by the French government. Giolitti removed the prefect of Rome for not having prevented an expression of popular anger, and presented formal excuses to the French consul at Messina for a demonstration against that consulate. In the following December the French tribunal at Angoulême acquitted all the authors of the massacre. At home Giolitti displayed the same weakness. Riots at Naples in August 1893 and symptoms of unrest in Sicily found him, as usual, unprepared and vacillating. The closing of the French market to Sicilian produce, the devastation wrought by the phylloxera and the decrease of the sulphur trade had combined to produce in Sicily a discontent of which Socialist agitators took advantage to organize the workmen of the towns and the peasants of the country into groups known as fasci. The movement had no well-defined object. Here and there it was based upon a bastard Socialism, in other places it was made a means of municipal party warfare under the guidance of the local mafia, and in some districts it was simply popular effervescence against the local octrois on bread and flour. As early as January 1893 a conflict had occurred between the police and the populace, in which several men, women and children were killed, an occurrence used by the agitators further to inflame the populace. Instead of maintaining a firm policy, Giolitti allowed the movement to spread until, towards the autumn of 1893, he became alarmed and drafted troops into the island, though in numbers insufficient to restore order. At the moment of his fall the movement assumed the aspect of an insurrection, and during the interval between his resignation (24th November) and the formation of a new Crispi cabinet (10th December) conflicts between the public forces and the rioters were frequent. The return of Crispi to power—a return imposed by public opinion as that of the only man capable of dealing with the desperate situation—marked the turning-point of the crisis. Intimately acquainted with the conditions of his native island, Crispi adopted efficacious remedies. Tanlongo, suppressed, Sicily was filled with troops, the reserves were called out, the state courts were placed beyond the control of the military courts instituted and the whole movement crushed in a few weeks. The chief agitators were either sentenced to heavy terms of imprisonment or were compelled to flee the country. A simultaneous insurrection at Massa-Carrara was crushed with similar vigour. Crispi’s methods aroused great outcry in the Radical press, but the severe sentences of the military courts were in time tempered by the Royal prerogative of amnesty.

But it was not alone in regard to public order that heroic measures were necessary. The financial situation inspired serious misgivings. While engagements contracted by Depretis in regard to public works had more than neutralized the normal increase of revenue from taxation, the whole credit of the state had been affected by the severe economic and financial crises of the years 1889-1893. The state banks, already hampered by maladministration, were encumbered by huge quantities of real estate which had been taken over as compensation for unredeemed mortgages. Baron Sidney Sonnino, minister of finance in the Crispi cabinet, found a prospective deficit of £1,200,000, and in spite of economic mismanagement was obliged to face an actual deficit of more than £6,000,000. Drastic measures were necessary to limit expenditure and to provide new sources of revenue. Sonnino applied, and subsequently amended, the Bank Reform Bill passed by the previous Administration (August 10, 1893) for the creation of a supreme state bank, the Bank of Italy, which was entrusted with the liquidation of the insolvent Banca Romana. The new law forbade the state banks to lend money on real estate, limited their powers of discounting bills and securities, and reduced the maximum of their paper currency. In order to diminish the gold premium, which under Giolitti had risen to 16%, forced currency was given to the existing notes of the banks of Italy, Naples and Sicily, while special state notes were issued to meet immediate currency needs. Measures were enforced to prevent Italianholders of consols from sending their coupons abroad to be paid in gold, with the result that, whereas in 1893 £3,240,000 had been paid abroad in gold for the service of the January coupons and only £680,000 in paper in Italy, the same coupon was paid a year later with only £1,350,000 abroad and £2,540,000 at home. Economies for more than £4,800,000, were immediately effected, taxes, calculated to produce £1,440,000, were proposed to be placed upon land, incomes, salt and corn, while the existing income-tax upon consols (fixed at 8% by Cambray-Digny in 1868, and raised to 13-20% by Sella in 1870) was increased to 20% irrespectively of the stockholders’ nationality. These proposals met with opposition so fierce as to cause a cabinet crisis, but Sonnino who resigned office as minister of finance,
returned to power as minister of the treasury, promulgated some of his proposals by royal decree, and in spite of vehement opposition secured their ratification by the Chamber. The tax upon consols, which, in conjunction with the other severe fiscal measures, was regarded abroad as a pledge that Italy intended at all costs to avoid bankruptcy, caused a rise in Italian stocks. When the Crispi cabinet fell in March 1896 Sonnino had the satisfaction of seeing revenue increased by £3,400,000, expenditure diminished by £2,800,000, the gold premium reduced from 16 to 5%, consolidated stock at 95 instead of 72, and, notwithstanding the expenditure necessitated by the Abyssinian War, financial equilibrium practically restored.

While engaged in restoring order and in supporting Sonnino’s courageous struggle against bankruptcy, Crispi became the object of fierce attacks from the Radicals, Socialists, and anarchists. On the 16th of June an attempt by an anarchist named Lega was made on Crispi’s life; on the 24th of June President Carnot was assassinated by the anarchist Caserio; and on the 30th of June an Italian journalist was murdered at Leghorn for a newspaper attack upon anarchism—a series of outrages which led the government to frame and parliament to adopt (11th July) a Public Safety Bill for the prevention of anarchist propaganda and crime. At the trial of the personal implicates of the Banca Romana scandal reversal revealed the fact that among the documents abstracted by Giolitti from the papers of the bank manager, Tanlongo, were several bearing upon Crispi’s political and private life. On the 11th of December Giolitti laid these and other papers before the Chamber, in the hope of ruining Crispi, but upon examination most of them were found to be worthless, and the rest of so private a nature as to be unfit for publication. The effect of the incident was rather to increase detestation of Giolitti than to damage Crispi. The latter, indeed, prosecuted the former for libel and for abuse of his position when premier, but after many vicissitudes, including the flight of Giolitti to Berlin in order to avoid arrest, the Chamber refused authorization for the prosecution, and the matter dropped. A fresh attempt of the same kind was then made against Crispi by the Radical leader Cavallotti, who advanced unproven charges of corruption and embezzlement. These attacks were, however, unavailing to shake Crispi’s position, and in the general election of May 1895 his government obtained a majority of nearly 200 votes. Nevertheless public confidence in the stability of the government and the honesty of the opponents was seriously diminished by these unsavoury occurrences, which, in combination with the acquittal of all the defendants in the Banca Romana trial, and the abandonment of the proceedings against Giolitti, reinforced in an alarming degree the propaganda of the revolutionary parties.

The foreign policy of the second Crispi Administration, in which the portfolio of foreign affairs was held by Baron Blanc, was, as before, marked by a cordial interpretation of the triple alliance, and by close accord with Great Britain. In the Armenian question Italy stood with energy the diplomacy of Austria and Germany, while the Italian fleet joined the British Mediterranean squadron in a demonstration off the Syrian coast. Graver than any foreign question were the complications in Eritrea. Under the arrangement concluded in 1869 by Rudini with native chiefs in regard to the Italo-Abyssinian frontier districts, relations with Abyssinia had remained comparatively satisfactory. Towards the Sudan, however, the Mahdists, who had recovered from a defeat inflicted by Lord Gordon at Agordat in 1890, resumed operations in December 1893. Colonel Arimondi, commander of the colonial forces in the absence of the military governor, General Baratieri, attacked and routed a dervish force 10,000 strong on the 21st of December. The Italian troops, mostly native levies, numbered only 2,200 men. The dervish loss was more than 1,000 killed, while the total Italian casualties amounted to less than 250. General Baratieri, upon returning to the colony, decided to execute a coup de main against the dervish base at Kassala, both in order to relieve pressure from that quarter and to preclude a combined Abyssinian and dervish attack upon the colony at the end of 1894. The protocol concluded with Great Britain on the 15th of April 1893, already referred to, contained a clause to the effect that, were Kassala occupied by the Italians, the place should be transferred to the Egyptian government as soon as the latter should be in a position to restore order in the Sudan. Concentrating a little army of 2,600 men, Baratieri surprised and captured Kassala on the 17th of July 1894, and garrisoned the place with native levies under Italian officers. Meanwhile Menelek, jealous of the extension of Italian influence to a part of northern Somaliland and to the Benadir coast, had, with the support of France and Russia, completed his preparations for asserting his authority as independent ruler of Ethiopia. On the 11th of May 1893 he denounced the treaty of Uccialli, but the Giolitti cabinet, absorbed by the bank scandals, paid no heed to his action. Possibly an adroit repetition in favour of Mangashá and against Menelek of the policy formerly followed in favour of Menelek against the negus John might have consolidated Italian influence in Abyssinia by preventing the ascendency of any single chief. The Italian government, however, neglected this opening, and Mangashá came to terms with Menelek. Consequently the efforts of Crispi and his envoy, Colonel Piano, to conclude a new treaty with Menelek in June 1894 not only proved unsuccessful, but were concluded in an arrangement whereby Bath-Agos, the native chieftain who ruled the Okulé-Kusai and the cis-Mareb provinces on behalf of Italy, intrigued with Mangashá, ras of the trans-Mareb province of Tigré, and with Menelek, to raise a revolt against Italian rule on the high plateau. In December 1894 the revolt broke out, but Major Toselli with a small force marched rapidly against Bath Agos, whom he routed and killed at Halai. General Baratieri, having reason to suspect the complicity of Mangashá in the revolt, called upon him to furnish troops for a projected Italo-Abyssinian campaign against the Mahdists. Mangashá made no reply, and Baratieri crossing the Mareb advanced to Adowa, but four days later was obliged to return northwards. Mangashá thereupon took the offensive and attempted to occupy the village of Coait in Okulé-Kusai, but was forestalled and defeated by Baratieri on the 15th of January 1895. Hurriedly retreating to Senafé, hard pressed by the Italians, who shelled Senafé on the evening of the 15th of January, Mangashá was obliged to abandon his camp and provisions to Baratieri, who also secured a quantity of correspondence, which exposed the complicity of Menelek and Mangashá in the revolt of Bath-Agos. The comparatively facile success achieved by Baratieri against Mangashá seems to have led him to underestimate his enemy, and to forget that Menelek, negus and king of Shoa, had an interest in allowing Mangashá to be crushed, in order that the imperial authority and the superiority of Shoa over Tigrín arms might be the more strikingly asserted. After obtaining the establishment of an apostolic prefecture in Eritrea under the charge of Italian Franciscans, Baratieri expelled from the colony the French Lazarist missionaries for their alleged complicity in the Bath-Agos insurrection, and in March 1895 undertook the conquest of Tigré. Occupying Adigrat and Makallè, he reached Adowa on the 1st of April, and thence pushed forward to Axum, the holy city of Abyssinia. These places were garrisoned, and during the rainy season Baratieri returned to Italy, where he was received with unbounded enthusiasm. Whether he or the Crispi cabinet had any inkling of the enterprise to which they were committed by the occupation of Tigré is more than doubtful. Certainly Baratieri made no adequate preparations to repel an Abyssinian attempt to reconquer the province. Early in September both Mangashá and Menelek showed signs of activity, and on the 20th of September Makonnen, ras of Harrar, who up till then had been regarded as a friend and quasi-ally by Italy, expelled all Italians from his territory and marched with 30,000 men to join the negus. On returning to Eritrea, Baratieri mobilized his native reserves and pushed forward columns under Major Toselli and General Arimondi as far south as Amba Alagi. Mangashá fell back before the Italians, who obtained several minor successes; but on the 6th of December Toselli’s column, 2,000 strong, which...
through a misunderstanding continued to hold Amba Alagi, was almost annihilated by the Abyssinian vanguard of 40,000 men. Toselli and all but three officers and 300 men fell at their posts after a desperate resistance. Arimondi, collecting the survivors of the Toselli column, retreated to Makallè and Adigrat. At Makallè, however, he left a small garrison in the fort, which, on the 7th of January 1896 was invested by the Abyssinian army. Repeated attempts to capture the fort having failed, Menelek and Makonnen opened negotiations with Baratieri for its capitulation, and on the 21st of January the garrison, under Major Galliano, who had heroically defended the position, were permitted to march out with the honours of war. Meanwhile Baratieri received reinforcements from Italy, but remained undecided as to the best plan of campaign. Thus a month was lost, during which the Abyssinian army advanced to Hausen, a position slightly south of Adowa. The Italian commander attempted to treat with Menelek, but his negotiations merely enabled the Italian envoy, Major Salas, to ascertain that the Abyssinians were nearly 100,000 strong mostly armed with rifles and well supplied with artillery. The Italians, including camp-followers, numbered less than 25,000 men, a force too small for effective action, but too large to be easily provisioned at 70 miles in seven days. The Abyssinian camp, on the other hand, was almost devoid of water. For a moment Baratieri thought of retreat, especially as the hope of creating a diversion from Zaila towards Harrar had failed in consequence of the British refusal to permit the landing of an Italian force without the consent of France. The defection of a number of native allies (who, however, were attacked and defeated by Colonel Stevani on the 18th of February) rendered the Italian position still more precarious; but Baratieri, unable to make up his mind, continued to manoeuvre in the hope of drawing an Abyssinian attack. These futile tactics exasperated the home government, which on the 22nd of February despatched General Baldissara, with strong reinforcements, to supersede Baratieri. On the 25th of February Crispì telegraphed to Baratieri, denouncing his operations as "military phthisis," and urging him to decide upon some strategic plan. Baratieri, anxious probably to obtain some success before the arrival of Baldissara, and alarmed by the rapid diminution of his stores, which precluded further immobility, called a council of war (26th of Feb. Bal) and decided upon the adoption of the divisions commanders for a plan of attack. During the night the army advanced towards Adowa in three divisions, under Generals Dabormida, Arimondi and Albertone, each division being between 4,000 and 5,000 strong, and a brigade 5,000 strong under General Ellena remaining in reserve. All the divisions, save that of Albertone, consisted chiefly of Italian troops. During the march Albertone's native division mistook the road, and found itself obliged to delay in the Arimondi column by retracing its steps. Marching rapidly, however, Albertone outdistanced the other columns, but, in consequence of allowing his men an hour's rest, arrived upon the scene of action when the Abyssinians, whom it had been hoped to surprise at dawn, were ready to receive the attack. Pressed by overwhelming forces, the Italians, after a violent combat, began to give way. The Dabormida division, unsupported by Albertone, found itself likewise engaged in a separate combat against superior numbers. Similarly the Arimondi brigade was attacked by 30,000 Shona, and encumbered by the débris of Albertone's troops. Baratieri, with a council of war (28th Bal) and the Italians already overwhelmed, and the battle—or rather, series of distinct engagements—ended in a general rout. The Italian loss is estimated to have been more than 6,000, of whom 3,125 were whites. Between 4,000 and 4,000 prisoners were taken by the Abyssinians, including General Albertone, while Generals Arimondi and Dabormida were killed and General Ellena wounded. The Abyssinians lost more than 3,000 killed and 8,000 wounded. Baratieri, after a futile attempt to direct the retreat, fled in haste and reached Adi-Cajè before the débris of his army. Thence he despatched telegrams to Italy throwing blame for the defeat upon his troops, a proceeding which sub-

Thence he despatched telegrams to Italy throwing blame for the defeat upon his troops, a proceeding which sub-
Anglo-Egyptian authorities. Under Signor Ferdinando Martini’s able administration (1898–1906) the cost of the colony to Italy was reduced and its trade and agriculture have vastly improved. While marked in regard to Eritrea by vacillation and un- dignified readiness to yield to Radical clamour, the policy of the marquis di Rudini was in other respects chiefly characterized by a desire to demolish Crispi and his supporters. Actuated by rancour against Crispi, he, on the 29th of April 1896, authorized the publication of a Green Book on Abyssinian affairs, in which, without the consent of Great Britain, the confidential Anglo-Italian negotiations in regard to the Abyssinian war were disclosed. This publication, which amounted to a gross breach of diplomatic confidence, might have endangered the cordiality of Anglo-Italian relations, had not the esteem of the British government for General Ferrero, Italian ambassador in London, induced it to overlook the incident. Fortunately for Italy, the marquis Visconti Venosta shortly afterwards consented to assume the portfolio of foreign affairs, which had been resigned by Duke Caetani di Sermontia, and again to place, after an interval of twenty years, his unrivalled experience at the service of his country. In September 1896 he succeeded in concluding with France a treaty with regard to Tunisia in place of the old Italo-Tunisian treaty, denounced by the French Government a year previously. During the Greco-Turkish War of 1897 Visconti Venosta laboured to maintain the European concert, joined Great Britain in preserving Greece from the worst consequences of her folly, and lent moral and material aid in establishing an autonomous government in Crete. At the same time he mitigated the Francophile tendencies of some of his colleagues, accompanied King Humbert and Queen Margherita on their visit to Homburg in September 1897, and, by loyal observance of the spirit of the triple alliance, retained for Italy the confidence of her allies without forfeiting the goodwill of France.

The home administration of the Rudini cabinet compared unfavourably with that of foreign affairs. Bound by a secret understanding with the Radical leader Cavallotti, an able but unscrupulous demagogue, Rudini was compelled to bow to Radical exigencies. He threw all the influence of the government against Crispi, who was charged with complicity in embezzlements perpetrated by Favilla, managing director of the Bologna branch of the Bank of Naples. After being subjected to persecution for nearly two years, Crispi’s character was substantially vindicated by the report of a parliamentary commission appointed to inquire into his relations with Favilla. True, the commission proposed and the Chamber adopted a vote of censure upon Crispi’s conduct in 1894, when, as premier and minister of the interior, he had borrowed £12,000 from Favilla to replenish the secret service fund, and had subsequently repaid the money as instalments for secret service were in due course furnished by the treasury. Though irregular, his action was to some extent justified by the depletion of the secret service fund under Giolitti and by the abnormal circumstances prevailing in 1893–1894, when he had been obliged to quell the insurrections in Sicily and Massa-Carrara. But the Rudini-Cavallotti alliance was destined to produce other results than those of the campaign against Crispi. Pressed by Cavallotti, Rudini in March 1897 dissolved the Chamber and conducted the general election in such a way as to crush by government pressure the partisans of Crispi, and greatly to strengthen the (Socialist, Republican and Radical) revolutionary parties. More than ever at the mercy of the Radicals and of their revolutionary allies, Rudini continued so to administer public affairs that subversive propaganda and associations obtained unprecedented extension. The effect was seen in May 1898, when, in consequence of a rise in the price of bread, disturbances occurred in southern Italy. The corn duty was reduced to meet the emergency, but the disturbed area extended to Naples, Foggia, Bari, Minervino-Murge, Molfetta and thence along the line of railway which skirts the Adriatic coast. At Faenza, Piacenza, Cremona, Pavia and Milan, where subversive associations were stronger, it assumed the complexion of a political revolt. From the 7th to the 9th of May Milan remained practically in the hands of the mob. A palace was sacked, barricades were erected and for forty-eight hours the troops under General Bava-Beccaris, notwithstanding the employment of artillery, were unable to restore order. In view of these occurrences, Rudini authorized the proclamation of a state of siege at Milan, Florence, Leghorn and Naples, delegating the suppression of disorder to special military commissioners. By these means order was restored, though not without considerable loss of life at Milan and elsewhere. At Milan alone the official returns confessed to eighty killed and several hundred wounded, a total generally considered below the real figures. As in 1894, excessively severe sentences were passed by the military tribunals upon revolutionary leaders and other persons considered to have been implicated in the outbreak, but successive royal amnesties obliterated these condeminations within three years.

No Italian administration since the death of Depretis underwent so many metamorphoses as that of the marquis di Rudini. He held a first time within five months of its forma- tion (July 1896) in connexion with General Ricotti’s Army Reform Bill, and again in December 1897, when Zanardelli entered the cabinet, it was recon- structed for a third time at the end of May 1898 upon the question of a Public Safety Bill, but fell for the fourth and last time on the 18th of June 1898, on account of public indignation at the results of Rudini’s home policy as exemplified in the May riots. On the 20th of June Rudini was succeeded in the premiership by General Luigi Pelloux, a Savoyard, whose only title to office was the confidence of the king. The Pelloux cabinet possessed no clear programme except in regard to the Public Safety Bill, which it had taken over from its predecessor. Presented to parliament in November 1898, the bill was read a second time in the following spring, but its third reading was violently obstructed by the Socialists, Radicals and Republicans of the Extreme Left. After a series of scenes the bill was promulgated by royal decree, the decree being post- dated to allow time for the third reading. Again obstruction precluded debate, and on the 22nd of July 1899 the decree automatically acquired force of law, pending the adoption of a bill of indemnity by the Chamber. In February 1900 it was, however, quashed by the supreme court on a point of procedure, and the Public Safety Bill as a whole had again to be presented to the Chamber. In view of the violence of Extremist obstruction, an effort was made to reform the standing orders of the Lower House, but parliamentary feeling ran so high that General Pelloux thought it expedient to appeal to the country. The general election of June 1900 not only failed to reinforce the cabinet, but largely increased the strength of the extreme parties (Radicals, Republicans and Socialists), who in the new Chamber numbered nearly 100 out of a total of 508. General Pelloux therefore resigned, and on the 24th of June a moderate Liberal cabinet was formed by the aged Signor Saracco, president of the senate. Within five weeks of its formation King Humbert was shot by an anarchist assassin named Bresci while leaving an athletic festival at Monza, where his Majesty had distributed the prizes (29th July 1900). The death of the unfortunate monarch, against whom an attempt had previously been made by the anarchist Acclariato (22nd April 1897), caused an outburst of profound sorrow and indignation. Though not a great monarch, King Humbert had, by his unflagging generosity and personal courage, won the esteem and affection of his people. During the cholera epidemic at Naples and Busca in 1884, and the Ischia earthquake of 1885, he, regardless of danger, brought relief and encouragement to sufferers, and rescued many lives. More than £100,000 of his civil list was annually devoted to charitable pur- poses. Humbert was succeeded by his only son, Victor Emmanuel III (b. November 11, 1869), a liberal-minded and well-educated prince, who at the time of his father’s assassination was returning from a cruise in the eastern Mediterranean. The remains of King Humbert were laid to rest in the Pantheon at Rome beside those of his father, Victor Emmanuel II (9th August). Two
days later Victor Emmanuel III. swore fidelity to the constitution before the assembled Houses of Parliament and in the presence of his consort, Elena of Montenegro, whom he had married in October 1896.

The later course of Italian foreign policy was marked by many vicissitudes. Admiral Canevaro, who had gained distinction as commander of the international forces in Crete (1896–1898), assumed the direction of foreign affairs in the first period of the Pelloux administration. His diplomacy, though energetic, lacked steadiness. Soon after taking office he completed the negotiations begun by the Rudini administration for a new commercial treaty with France (October 1898), whereby Franco-Italian commercial relations were placed upon a normal footing after a breach which had lasted for more than ten years. By the despatch of a squadron to South America he obtained satisfaction for injuries inflicted thirteen years previously upon an Italian subject by the United States of Colombia. In December 1898 he convoked a diplomatic conference in Rome to discuss secret means for the repression of anarchist propaganda and crime in view of the assassination of the empress of Austria by an Italian anarchist (Luccheni), but it is doubtful whether results of practical value were achieved.

The action of the tsar of Russia in convening the First Balkan Congress at The Hague in May 1908 gave rise to a question as to the right of the Vatican to be officially represented, and Admiral Canevaro, supported by Great Britain and Germany, succeeded in preventing the invitation of a papal delegate. Shortly afterwards his term of office was brought to a close by the failure of an attempt to secure for Italy a coal station at Sanmen and a sphere of influence in China; but his policy of active participation in Chinese affairs was continued in a modified form by his successor, the Marquis Visconti Venosta, who, entering the reconstructed Pelloux cabinet in May 1909, retained the portfolio of foreign affairs in the ensuing Saracco administration, and secured the despatch of an Italian expedition, 2000 strong, to aid in repressing the Chinese outbreak and in protecting Italian interests in the Far East (July 1909). With characteristic foresight, Visconti Venosta promoted an exchange of views between Italy and France in regard to the Tripolitanian hinterland, which the Anglo-French convention of 1899 had placed within the French sphere of influence—a modification of the statuts quo ante considered highly detrimental to Italian aspirations. In Tripoli, Foreign Office officials felt that the Anglo-French convention had caused profound irritation in Italy, and had tended somewhat to diminish the cordiality of Anglo-Italian relations. Visconti Venosta is believed, however, to have obtained from France a formal declaration that France would not transgress the limits assigned to her influence by the convention. Similarly, in regard to Albania, Visconti Venosta exchanged notes with Austria with a view to the prevention of any misunderstanding through the conflict between Italian and Austrian interests in that part of the Adriatic coast. Upon the fall of the Saracco cabinet (9th February 1901) Visconti Venosta was succeeded at the foreign office by Signor Prinetti, a Lombard manufacturer of strong temperament, but without previous diplomatic experience. The new minister continued in most respects the policy of his predecessor. The outset of his administration was marked by Franco-Italian fêtes at Toulon (10th to 14th April 1901), when the Italian fleet returned a visit paid by the French Mediterranean squadron to Cagliari in April 1899; and by the despatch of three Italian warships to Preveza to obtain satisfaction for damage done to Italian subjects by Turkish officials.

The Saracco administration, formed after the obstructionist crisis of 1899-1900 as a cabinet of transition and pacification, was overthrown in February 1901 in consequence of its vacillating conduct towards a dock strike at Genoa. It was succeeded by a Zanardelli cabinet, in which the portfolio of the interior was allotted to Giolitti. Composed mainly of elements drawn from the Left, and dependent for a majority upon the support of the subversive groups of the Extreme Left, the formation of this cabinet gave the signal for a vast working-class movement, during which the Socialist party sought to extend its political influence by means of strikes and the organization of labour leagues among agricultural labourers and artisans. The movement was confined chiefly to the northern and central provinces. During the first six months of 1901 the strikes numbered 600, and involved more than 1,000,000 workmen.

In 1901-1902 the social economic condition of Italy was a matter of grave concern. The strikes and other economic agitations at this time may be divided roughly into three groups: strikes in industrial centres for higher wages, shorter hours and better labour conditions generally; strikes of agricultural labourers in northern Italy for better contracts with the landlords; disturbances among the south Italian peasantry due to low wages, unemployment (particularly in Apulia), and the claims of the labourers to public land occupied illegally by the landlords, combined with local feuds and the struggle for power of the various influential families. The prime cause in most cases was the unsatisfactory economic condition of the working classes, which they realized all the more vividly for the very improvements that had been made in it, while agitation and legitimate complaints enabled them to organize themselves. Unfortunately these genuine grievances were often taken advantage of by the Socialists for their own purposes, and strikes and disorders were sometimes promoted without cause and conciliation impeded by outsiders who acted from motives of personal ambition or profit. Moreover, while many strikes were quite orderly, the turbulent character of a part of the Italian people and their hatred of authority often converted peaceful demands for better conditions into dangerous riots, in which the dregs of the urban population (known as teppisti or the malas vista) joined.

Whereas in the past the strikes had been purely local and due to local conditions, they now appeared of more general and political character, and the "sympathy" strike came to be a frequent and undesirable addition to the ordinary economic agitation. The most serious movement at this time was that of the railway servants. The agitation had begun some fifteen years before, and the men had at various times demanded better pay and shorter hours, often with success. The next demand was for greater fixity of terms and more regular promotion, as well as for the recognition of the companies’ right to a union. On the 4th of January 1902, the employees of the Mediterranean railway advanced these demands at a meeting at Turin, and threatened to strike if they were not satisfied. By the beginning of February the agitation had spread all over Italy, and the government was faced by the possibility of a strike which would paralyse the whole economic life of the country. Then the Turin gas men struck, and a general "sympathy" strike broke out in that city in consequence, which resulted in scenes of violence lasting two days. The government called out all the railwaymen who were army reservists, but continued to keep them at their railway work, exercising military discipline over them and thus ensuring the continuance of the service. At the same time it mediated between the companies and the employees, and in June a settlement was formally concluded between the ministers of public works and of the treasury and the directors of the companies concerning the grievances of the employees.

One consequence of the agrarian agitation was the increased use of machinery and the reduction in the number of hands employed, which if it proceeded would be detrimental not only to the few labourers retained, who received higher wages, resulted in an increase of unemployment. The Socialist party, which had grown powerful under a series of weak-kneed administrations, now began to show signs of division; on the one hand there was the revolutionary wing, led by Signor Enrico Ferri, the Mantuan deputy, which advocated a policy of uncompromising class warfare, and on the other the riformisti, or moderate Socialists, led by Signor Filippo Turati, deputy for Milan, who adopted a more conciliatory attitude and were ready to ally themselves with other parliamentary parties. Later the division took another
aspect, the extreme wing being constituted by the sindacalisti, who were opposed to all legislative parliamentary action and favoured only direct revolutionary propaganda by means of the sindacati or unions which organized strikes and demonstrations. In March 1902 agrarian strikes organized by the leghe broke out in the district of Copparo and Polesine (lower valley of the Po), owing to a dispute about the labour contracts, and in Apulia on account of unemployment. In August there were strikes among the dock labourers of Genoa and the iron workers of Florence; the latter agitation developed into a general strike in that city, which aroused widespread indignation among the orderly part of the population and ended without any definite result. At Como 15,000 textile workers remained on strike for nearly a month, but there were no disorders.

The year 1903, although not free from strikes and minor disturbances, was quieter, but in September 1904 a very serious situation was brought about by a general economic and political agitation. The troubles began with the disturbances at Buggeru in Sardinia and Castellazzo in Sicily, in both of which places the troops were compelled to use their bayonets, the personal persons were killed and wounded; at a demonstration at Sestri Ponente in Liguria to protest against what was called the Buggeru "massacre," four carabiniers and eleven rioters were injured. The Monza labour exchange then took the initiative of proclaiming a general strike throughout Italy (September 15th) as a protest against the government for daring to maintain order. The strike spread to nearly all the industrial centres, although in many places it was limited to a few trades. At Milan it was more serious and lasted longer than elsewhere, as the movement was controlled by the anarchists under Arturo Labriola; the hooligans committed many acts of savage violence, especially against those workmen who refused to strike, and much property was willfully destroyed. At Genoa, which was in the hands of the toppisti for a couple of days, three persons were killed and 50 wounded, including 14 policemen, and railway communications were interrupted for a short time. Venice was cut off from the mainland for two days and all the public services were suspended. Riots broke out also in Naples, Florence, Rome and Bologna. The deputies of the Extreme Left, instead of using their influence in favour of pacification, could think of nothing better than to demand an immediate convocation of parliament in order that they might present a bill forbidding the troops and police to use their arms in all conflicts between capital and labour, whatever the provocation might be. This preposterous proposal was of course not even discussed, and the movement caused a strong feeling of reaction against Socialism and of hostility to the government for its weakness; for, however much sympathy there might be with the genuine grievances of the working classes, the September strikes were of a frankly revolutionary character and had been fomented by professional agitators and kept going by the dregs of the people. The mayor of Venice sent a firm and dignified protest to the government for its inaction, and the people of Liguria raised a large subscription in favour of the troops, in recognition of their gallantry and admirable discipline during the troubles.

Early in 1905 there was a fresh agitation among the railway servants, who were dissatisfied with the clauses concerning the personnel in the bill for the purchase of the lines by the state. They initiated a system of obstruction which hampered and delayed the traffic without altogether suspending it. On the 17th of April a general railway strike was ordered by the union, but owing to the action of the authorities, who for once showed energy, the traffic was carried on. Other disturbances of a serious character occurred among the steelworkers of Terni, at Grannimiche in Sicily and at Alessandria. The extreme parties now began to direct especial attention to propaganda in the army, with a view to destroying its cohesion and thus paralysing the action of the government. The campaign was conducted on the lines of the anti-militarist movement in France identified with the name of Hervé. Fortunately, however, this policy was not successful, as military service is less unpopular in Italy than in many other countries; aggressive militarism is quite unknown, and without it anti-militarism can gain no foothold. No serious mutinies have ever occurred in the Italian army, and the only results of the propaganda were occasional meetings of hooligans, where Hervéist sentiments were expressed and applauded, and a few minor disturbances among reservists unexpectedly called back to the colours. In the army itself the esprit de corps and the sense of duty and discipline nullified the work of the propagandists.

In June and July 1907 there were again disturbances among the agricultural labourers of Ferrara and Rovigo, and a widespread strike organized by the leghe throughout those provinces caused very serious losses to all concerned. The leghisti, moreover, were guilty of much criminal violence; they committed one murder and established a veritable reign of terror, boycotting, beating and wounding numbers of peaceful labourers who would not join the unions, and brutally maltreating solitary policemen and soldiers. The authorities, however, by arresting a number of the more prominent leaders succeeded in restoring order. Almost immediately afterwards an agitation of a still less defensible character broke out in various parts of the country, and the police, who had come to light in a small convent school at Greco near Milan. This was seized upon as a pretext for violent anti-clerical demonstrations all over Italy and for brutal and unprovoked attacks on unoffending priests; at Spezia a church was set on fire and another dismantled, at Marino Cardinal Merry del Val was attacked by a gang of hooligans, and at Rome the violence of the toppisti reached such a pitch as to provoke reaction on the part of all respectable people, and some of the aggressors were very roughly handled. The Socialists and the Freemasons were largely responsible for the agitation, and they filled the country with stories of other priestly and convivial immorality, nearly all of which, except the original case at Greco, proved to be without foundation. In September 1907 disorders in Apulia over the repartition of communal lands broke out anew, and were particularly serious at Ruvo, Bari, Cerignola and Satrano del Colle. In some cases there was foundation for the labourers' claims, but unfortunately the movement got into the hands of professional agitators and common swindlers, and the leader, a certain Giampietruzzi, who at one time seemed to be a worthy colleague of Marcelin Albert, was afterwards tried and condemned for having cheated his own followers.

In October 1907 there was again a general strike at Milan, which was rendered more serious on account of the action of the railway servants, and extended to other cities; traffic was disorganized over a large part of northern Italy, until the government, being now owner of the railways, dismissed the ringleaders from the service. This had the desired effect, and although the Sindacato dei ferrovieri (railway servants' union) threatened a general railway strike if the dismissed men were not reinstated, there was no further trouble. In the spring of 1908 there were agrarian strikes at Parma; the labour contracts had pressed hardly on the peasantry, who had cause for complaint; but while some improvement had been effected in the new contracts, certain unscrupulous demagogues, of whom Alceste De Ambris, representing the "syndicalist" wing of the Socialist party, was the chief, organized a widespread agitation. The landlords on their part organized an agrarian union to defend their interests and enrolled numbers of non-union labourers to carry on the necessary work and save the crops. Conflicts occurred between the strikers and the independent labourers and the police; the trouble spread to the city of Parma, where violent scenes occurred when the labour exchange was occupied by the troops, and many soldiers and policemen, whose behaviour as usual was exemplary throughout, were seriously wounded. The agitation ceased in June with the defeat of the strikers, but not until a vast amount of damage had been done to the crops and all had suffered heavy losses, including the government, whose expenses for the maintenance of public order ran into tens of millions of lire. The failure of the strike caused the Socialists to quarrel among themselves and to accuse each other of dishonesty in the management of party funds; it appeared in fact
that the large sums collected throughout Italy on behalf of the strikers had been squandered or appropriated by the "syndicalist" leaders. The spirit of indiscipline had begun to reach the lower classes of state employees, especially the school teachers and the postal and telegraph clerks, and at one time it seemed as though the country were about to face a situation similar to that which arose in France in the spring of 1909. Fortunately, however, the government, by dismissing the ringleader, Dr Campanozzi, in time nipped the agitation in the bud, and it did attempt to redress some of the genuine grievances. Public opinion upheld the government in its attitude, for all persons of common sense realized that the suspension of the public services could not be permitted for a moment in a civilized country.

In parliamentary politics the most notable event in 1902 was the presentation of a divorce bill by Signor Zanardelli's government; this was done not because there was any real demand for it, but to please the doctrinaire anti-clericals and freemasons, divorce being regarded not as a social institution but as a weapon against Catholicism. But while the majority of the deputies were nominally in favour of the bill, the parliamentary committee reported against it, and public opinion was so hostile that an anti-divorce petition received 3,500,000 signatures, including not only those of professing Catholics, but of free-thinkers and Jews, who regarded divorce as unsuitable to Italian conditions. The opposition outside parliament was in fact so overwhelming that the ministry decided to drop the bill. The financial situation continued satisfactory; a new loan at 3½% was voted by the Chamber in April 1902, and by June the whole of it had been placed in Italy. In October the rate of exchange was at par, the premium on gold had disappeared, and by the end of the year the budget showed a surplus of sixteen millions.

In January 1903 Signor Prinetti, the minister of foreign affairs, resigned on account of ill-health and was succeeded by Admiral Morin, while Admiral Bettolo took the latter's place as minister of marine. The unpopularity of the ministry forced Signor Giolitti, the minister of the interior, to resign (June 1903), and he was followed by Admiral Bettolo, whose administration had been violently attacked by the Socialists; in October Signor Zanardelli, the premier, resigned on account of his health, and the king entrusted the formation of the cabinet to Signor Giolitti. The latter accepted the task, and the new administration included Signor Tittoni, late prefect of Naples, as foreign minister, Signor Luigi Luzzatti, the eminent financier, at the treasury, General Pedottii at the war office, and Admiral Mirabell as minister of marine. Almost immediately after his appointment Signor Tittoni accompanied the king and queen of Italy on a state visit to France and then to England, where various international questions were discussed and the cordial reception which the royal pair met with in London and at Windsor served to dispel the small cloud which had arisen in the relations of the two countries on account of the Tripoli agreements and the language question in Malta. The premier's programme was not well received by the Chamber, although the treasury minister's financial statement was again satisfactory. The weakness of the government in dealing with the strike riots caused a feeling of profound dissatisfaction, and the so-called "experiment of liberty," conducted with the object of conciliating the extreme parties, proved a dismal failure. In October 1904, after the September strikes, the Chamber was dissolved, and at the general elections in November a ministerial majority was returned, while the deputies of the Extreme Left (Socialists, Republicans and Radicals) were reduced from 107 to 94, and a few minor clericals elected. The municipal elections in several of the larger cities, which had hitherto been regarded as strongholds of socialism, marked an overwhelming triumph for the constitutional parties, notably in Milan, Turin and Genoa, for the strikes had wrought as much harm to the working classes as to the bourgeoisie. In spite of its majority the Giolitti cabinet, realizing that it had lost its hold over the country, resigned in March 1905.

Signor Fortis then became premier and minister of the interior, Signor Maiorano finance minister and Signor Carcano treasury minister, while Signor Tittotii, Admiral Mirabella and General Pedotti retained the portfolios they had held in the previous administration. The new government was colourless in the extreme, and the premier's programme aroused no enthusiasm in the House, the most important bill presented being that for the purchase of the railways, which was voted in June 1905. But the ministry never had any real hold over the country or parliament, and the dissatisfaction caused by the modus vivendi with Spain, which would have wrought much injury to the Italian wine-growers, led to demonstrations and riots, and a hostile vote in the Chamber produced a cabinet crisis (December 17, 1905); Signor Fortis, however, reconstructed the ministry, inducing the marquis di San Giuliano to accept the portfolio of foreign affairs. This last fact was significant, as the new foreign minister's declaration of his intention to settle international politics, had hitherto been one of Signor Sonnino's staunchest adherents; his defection, which was but one of many, showed that the more prominent members of the Sonnino party were tired of waiting in vain for their chief's access to power. Even this cabinet was still-born, and a hostile vote in the Chamber on the 30th of January 1906 brought about its fall.

Now at last, after waiting so long, Signor Sonnino's hour had struck, and he became premier for the first time. This result was most satisfactory to all the best elements in the country, and great hopes were entertained that the advent of a rigid and honest statesman would usher in a new era of Italian parliamentary life. Unfortunately at the very outset of its career the composition of the new cabinet proved disappointing; for while such men as Count Guicciardini, the minister for foreign affairs, and Signor Luzzatti at the treasury commanded general approval, the choice of Signor Sacchi as minister of justice and of Signor Pedotti as minister of agriculture and trade, both of them advanced and militant Radicals, savoured of an unholy compact between the premier and his erstwhile bitter enemies, which boded ill for the success of the administration. For this unfortunate combination Signor Sonnino himself was not altogether to blame; having lost many of his most faithful followers, who, weary of waiting for office, had gone over to the enemy, he had been forced to seek support among men who had professed hostility to the existing order of things and thus to secure at least the neutrality of the Extreme Left and make the public realize that the "reddest" of Socialists, Radicals and Republicans may be tamed and rendered harmless by the offer of cabinet appointments. A similar experiment had been tried in France not without success. Unfortunately in the case of Signor Sonnino public opinion expected too much and did not take to the idea of such a combination, as the new premier's Sicilian act was one which cannot be sufficiently praised; he suppressed all subsidies to journalists, and although this resulted in bitter attacks against him in the columns of the "reptile press" it commanded the approval of all right-thinking men. Signor Sonnino realized, however, that his majority was not to be counted on: "The country is with me," he said to a friend, "but the Chamber is against me." In April 1906 an eruption of Mount Etna caused the destruction of several villages and much loss of life and damage to property; in appointing a committee to distribute the relief funds the premier refused to include any of the deputies of the devastated districts among its members, and when asked by them for the reason of this omission, he replied, with a frankness more characteristic of the man than politic, that he knew they would prove more solicitous in the distribution of relief for their own electors than for the real sufferers. A motion presented by the Socialists in the Chamber for the immediate discussion of a bill to prevent the miscarriages of justice and of Signor Luzzatti was rejected by an enormous majority, the 28 Socialist deputies resigned their seats; on presenting themselves for re-election their number was reduced to 25. A few days later the ministry, having received an adverse vote on a question of procedure, sent in its resignation (May 17).
The fall of Signor Sonnino, the disappointment caused by the non-fulfilment of the expectations to which his advent to power had given rise throughout Italy and the dearth of influential statesmen, made the return to power of Signor Giolitti inevitable. An appeal to the country might have brought about a different result, but it is said that opposition from the highest quarters rendered this course practically impossible. The change of government brought Signor Tittoni back to the foreign office; Signor Maiorano became treasury minister, General Viganò minister of war, Signor Cocco Ortu, whose chief claim to consideration was the fact of his being a Sardinian (the island had rarely been represented in the cabinet) minister of agriculture, Signor Gianturco of justice, Signor Massimini of finance, Signor Schanzler of posts and telegraphs and Signor Fusinato of education. The new ministry began auspiciously with the conversion of the public debt from 4% to 3 1/2%, to be eventually reduced to 3 1/2%. This operation had been prepared by Signor Luzzatti under Signor Sonnino's leadership, and although carried out by Signor Maiorano it was Luzzatti who deservedly reapplied the honour and glory; the bill was presented, discussed and voted by both Houses on the 26th of June, and by the 7th of July the conversion was completed most successfully, showing on how sound a basis Italian finance was now placed. The surplus for the year amounted to 65,000,000 lire. In November Signor Gianturco died, and Signor Pietro Bertolini took his place as minister of public works; the latter proved perhaps the ablest member of the cabinet, but the acceptance of office under Giolitti of a man who had been one of the most trusted and valuable lieutenants of Signor Sonnino marked a further step in the dégringolade of that statesman's party, and was attributed to the fact that Signor Bertolini resented not having had a place in the late Sonnino ministry. General Viganò was succeeded in December by Senator Casana, the first civilian to become minister of war in Italy. He made various reforms which were badly wanted in army administration, but on the whole the experiment of a civilian "War Lord" was not a complete success, and in April 1909 Senator Casana retired and was succeeded by General Spingardi, an appointment which received general approval.

The elections of March 1909 returned a chamber very slightly different from its predecessor. The ministerial majority was over three hundred, and although the Extreme Left was somewhat increased in numbers it was weakened in tone, and many of the newly elected "reds" were hardly more than pale pink.

Meanwhile, the relations between Church and State began to show signs of change. The chief supporters of the claims of the papacy to temporal power were the clericals of France and Austria, but in the former country they had lost all influence, and the situation between the Church and the government was becoming every day more strained. With the rebellion of her "Eldest Daughter," the Roman Church could not continue in her old attitude of uncompromising hostility towards United Italy, and the Vatican began to realize that Italy was no longer anti-clerical. It had become a good Italian or a good Catholic, when the majority wished to be both. Outside of Rome relations between the clergy and the authorities were as a rule quite cordial, and in May 1903 Cardinal Sarto, the patriarch of Venice, asked for and obtained an audience with the king when he visited that city, and the meeting which followed was of a very friendly character. In July following Leo XIII. died, and that same Cardinal Sarto became pope under the style of Pius X. The new pontiff, although nominally upholding the claims of the temporal power, in practice attached but little importance to it. At the elections for the local bodies the Catholics had already been permitted to vote, and, availing themselves of the privilege, they gained seats in many municipal councils and obtained the majority in some. At the general parliamentary elections of 1909 a few Catholics had been elected as such, and the encyclical of the 11th of June 1905 on the political organization of the Catholics, practically abolished the non expedite. In September of that year a number of religious institutions in the Near East, formerly under the protectorate of the French government, in view of the rupture between Church and State in France, formally asked to be placed under Italian protection, which was granted in January 1907. The situation thus became the very reverse of what it had been in Crispi's time, when the French government, even when anti-clerical, protected the Catholic Church abroad for political purposes, whereas the conflict between Church and State in Italy extended to foreign countries, to the detriment of Italian political interests. A more difficult question was that of religious education in the public elementary schools. Signor Giolitti wished to conciliate the Vatican by facilitating religious education, which was desired by the majority of the parents, but he did not wish to offend the Freemasons and other anti-clericals too much, as they could always give trouble at awkward moments. Consequently the minister of education, Signor Rava, concocted a body of rules which, it was hoped, would satisfy every one: religious instruction was to be maintained as a necessary part of the curriculum, but in communities where the majority of the municipal councillors were opposed to it it might be suppressed; the council in that case must, however, facilitate the teaching of religion to those children whose parents desire it. In practice, however, when the council has suppressed religious instruction no such facilities are given. At the general elections of March 1909, over a score of Clerical deputies were returned, Clericals of a very mild tone who had no thought of the temporal power and were supporters of the monarchy and anti-socialists; where no Clerical candidate was in the field the Catholic voters plumped for the constitutional candidate against all representatives of the Extreme Left. On the other hand, the attitude of the Vatican towards Liberalism within the Church was one of uncompromising reaction, and under the new pope the doctrines of Christian Democracy and Modernism were condemned in no uncertain tone. Don Romolo Murri, the Christian Democratic leader, who exercised much influence over the younger and more progressive clergy, having been severely censured by the Vatican, made formal submission, and declared his intention of retiring from the struggle. But he appeared again on the scene in the general elections of 1909, as a Christian Democratic candidate; he was elected, and alone of the Catholic deputies took his seat in the Chamber on the Extreme Left, where all his neighbours were violent anti-clericals.

At 5 A.M. on the 28th of December 1908, an earthquake of appalling severity shook the whole of southern Calabria and the eastern part of Sicily, completely destroying the cities of Reggio and Messina, the smaller towns of Canitello, Scilla, Villa San Giovanni, Bagnara, Palmi, Melito, Porto Salvo and Santa Eufemia, as well as a large number of villages. In the case of Messina the horror of the situation was heightened by a tidal wave. The catastrophe was the greatest of its kind that has ever occurred in any country; the number of persons killed was approximately 150,000, while the injured were beyond calculation.

The characteristic feature of Italy's foreign relations during this period was the weakening of the bonds of the Triple Alliance and, to a certain extent, of the Triple Entente. The traditional friendship with England remained unimpaired. Franco-Italian friendship was officially cemented by the visit of King Victor Emmanuel and Queen Elena in October 1903 to Paris where they received a very cordial welcome. The visit was returned in April 1904 when M. Loubet, the French president, came to Rome; this action was strongly resented by the pope, who, like his predecessor since 1870, objected to the presence of foreign Catholic rulers in Rome, and led to the final rupture between France and the Vatican. The Franco-Italian understanding had the effect of raising Italy's credit, and the Italian rente, which had been shut out of the French bourses, resumed its place there once more, a fact which contributed to increase its price and to reduce the unfavourable rate of exchange. That agreement also served to clear up the situation in Tripoli; while Italian aspirations towards Tunisia had been ended by the French occupation of that territory, Tripoli and Bengazi were now recognized as coming within the Italian sphere of influence. The Tripoli hinterland,
ITALY

[1902–1909]

however, was in danger of being absorbed by other powers having large African interests; the Anglo-French declaration of the 24th of March 1899 in particular seemed likely to interfere with Italian activity.

The Triple Alliance was maintained and renewed as far as paper documents were concerned (in June 1902 it was reconfirmed for 12 years), but public opinion was no longer so favourably disposed towards it. Austria’s petty persecutions of her Italian subjects in the irredente provinces, her active propaganda incompatible with Italian interests in the Balkans, and the anti-Italian war talk of Austrian military circles, imperilled the relations of the two “allies”; it was remarked, indeed, that the object of the alliance between Austria and Italy was to prevent war between them. Austria had persistently adopted a policy of pin-pricks and aggravating police provocation towards the Italians of the Adriatic Littoral and of the Trentino, while encouraging the Slavonic element in the former and the Germans in the latter. One of the causes of ill-feeling was the university question; the Austrian government had persistently refused to create an Italian university for its Italian subjects, fearing lest it should become a hotbed of “irredentism,” the Italian-speaking students being thus obliged to attend the German-Austrian universities. An attempt at compromise resulted in the institution of an Italian law faculty at Innsbruck, but this aroused the violent hostility of the German students and populace, who gave proof of their superior civilization by an unprovoked attack on the Italians in October 1902. Further acts of violence were committed by the Germans in 1903, which led to anti-Austrian demonstrations in Italy. The worst tumults occurred in November 1903, when Italian students and professors were attacked at Innsbruck without provocation; being outnumbered by a hundred to one the Italians were forced to use their revolvers in self-defence, and several persons were wounded on both sides. Anti-Italian demonstrations occurred periodically also at Vienna, while in Dalmatia and Croatia Italian fishermen and workmen of Italian origin, not natives, were subject to attacks by gangs of half-savage Croats, who in turn subjected diplomatic “incidents.”

A further cause of resentment was Austria’s attitude towards the Vatican, inspired by the strong clerical tendencies of the imperial family, and indeed of a large section of the Austrian people. But the most serious point at issue was the Balkan question. Italian public opinion could not view without serious misgivings the active political propaganda which Austria was conducting in Albania. The two governments frequently discussed the situation, but although they had agreed to a self-denying ordinance whereby each bound itself not to occupy any part of Albanian territory, Austria’s declarations and promises were hardly borne out by the activity of her agents in the Balkans. Italy, therefore, instituted a counter-propaganda by means of schools and commercial agencies. The Macedonian troubles of 1903 again brought Austria and Italy into conflict. The acceptance by the powers of the Mürzsteg programme and the appointment of an Austrian commissioner and a financial agent in Macedonia was an advantage for Austria and led to a forward policy for Italy; the latter scored a success in the appointment of General de Giorgis as commander of the international Macedonian gendarmerie; she also obtained, with the support of Great Britain, France and Russia, the assignment of the partly Albanian district of Monastir to the Italian officers of that corps.

In October 1908 came the casus belli of the Austrian annexation of Bosnia, announced to King Victor Emmanuel and to other rulers by autograph letters from the emperor-king. The news caused the most widespread sensation, and public opinion in Italy was greatly agitated at what it regarded as an act of brigandage on the part of Austria, when Signor Tittoni in a speech at Carate Brianza (October 6th) declared that “Italy might await events with serenity, and that these could find her neither unprepared nor isolated.” These words were taken to mean that Italy would receive compensation to restore the balance of power upset in Austria’s favour. When it was found that there was to be no direct compensation for Italy a storm of indignation was aroused against Austria, and also against Signor Tittoni.

On the 29th of October, however, Austria abandoned her military posts in the sandjak of Novibazar, and the frontier between Austria and Bulgaria was restored, which left Austria a half-open door to the Aegean, was now a distinct line of demarcation. Thus the danger of a “Pacific penetration” of Macedonia by Austria became more remote. Austria also gave way on another point, renouncing her right to police the Montenegrin coast and to prevent Montenegro from having warships of its own (paragraphs 5, 6 and 11 of the Berlin Treaty) in a note presented to the Italian foreign office on the 12th of April 1909. Italy had developed some important commercial interests in Montenegro, and anything which strengthened the position of that principality was a guarantee against further Austrian encroachments. The harbour works in the Montenegrin port of Antivari, commenced in March 1903 and completed early in 1909, were an Italian concern, and Italy became a party to the agreement for the Danube-Adriatic Railway (June 2, 1908) together with Russia, France and Serbia; Italy was to contribute 35,000,000 lire out of a total capital of 100,000,000, and to be represented by four directors of two years each. On turning to Italy, and the result was a national movement for security. Credits for the army and navy were voted almost without a dissentient voice; new battalions were laid down, the strength of the army was increased, and the defences of the exposed eastern border were strengthened. It was clear that so long as Austria, bribed by Germany, could act in so opposed to Italian interests in the Balkans, the Triple Alliance was a mockery, and Italy could only meet the situation by being prepared for all contingencies.

BIBLIOGRAPHY.—It is difficult to indicate in a short space the most important sources of general Italian history. Muratori’s great work (see Résumé des principaux documents historiques de l’italien dans l’ancien royaume de Sicile, Milan, 1897) is the starting point for the study of contemporary history. RIeti’s innumerable memoirs have been published in the Rivista storica Italiana, and constitute a storehouse of archival material. The account of “ill-fame” and “irredentism,” and the sketches of detached annalsists of whom the Villani are the most notable, take first rank. Next we should mention the important documentary source of the Una caccia d’Italia and its modern continuation by Carlo Botta. Among the more recent contributions S. de Sismondi’s Républiques italiennes (Brussels, 1839) and Carlo Troia’s Storia d’Italia nel medio evo are of the most valuable general worth, while the Storia Politica d’Italia by various authors, published at Milan, is also important—F. Bertolini, Il Barbari; F. Lanzi, Storia dei comuni italiani dalle origini fino al 1313 (1882); C. Cipolla, Storia delle cose stimate dal 1493 al 1505 (1890); G. Moretti, Le preponderanze straniere, 1530–1780 (1875); A. Franchetti, Storia d’Italia del 1796 al 1799; G. de Castro, Storia d’Italia dal 1789 al 1814 (1881). For the beginnings of Italian history the chief works are G. Baldi’s Storia d’Italia dal 961 al 1313 (Florence, 1879) and P. Villari’s Le invasioni barbariche (Milan, 1900), both based on original research and sound scholarship. The period from 1494 to modern times is dealt with in various volumes of the Cambridge Modern History, especially in vol. iv, The Renaissance, which contains valuable bibliographies. Giuseppe Ferrari’s Rivoluzione d’Italia (1858) deserves notice as a work of singular vigour, though without great scientific importance, and Cesare Balbo’s Sommario (Florence, 1856) presents the main outlines of the subject with prudence and clearness. For the period of the French revolution and the Napoleonic wars see F. Lemmi’s Le Origini del risorgimento italiano (Milan, 1906); E. Bonnal de Ganges, La Chute d’une république (Paris, 1885); D. Cartari, Storia del corso dei Sindaci in Italia dal 1797 al 1815 (2 vols, Turin, 1892); G. de Castro, Storia d’Italia dal 1797 al 1814 (Milan, 1881); A. Dufourc, Le Régime jacobin en Italie, 1796–1799 (Paris, 1900); Franchetti, Storia d’Italia dal 1798 al 1800 (Milan, 1878); P. Garelli, La Repubblica borbonica in Italia (2 vols, Bologna, 1890); P. Garelli, La Repubblica borbonica in Italia (2 vols, Bologna, 1893); R. M. Johnston, The Napoleonic Empire in Southern Italy (2 vols, with full bibliography, London, 1904); E. Ramondini, L’Italia durante la dominazione francese (Naples, 1882); E. Reth, Geschichte des französischen Staates unter der nachrevolutionären Herrschaft (Leipzig, 1859). For modern times, see Bolton King’s History of Italy (1898 and 1899) and Bolton King and Thomas Okey’s Italy To-day (1901). With regard to the history of separate provinces it may be mentioned that M. Novi’s Storia di Fiandra (1832–1838) and Italy (1832–1838); C. Signore’s Storia di Milano, G. Ca popponi’s Storia della repubblica di Firenze (Florence, 1875); P. Villari’s I primi due secoli della storia di Firenze (Florence, 1903); F. Pagano’s Storia del regno di Napoli (Palermo, Naples, 1892, &c.); P. Romani’s Storia documentata di Venezia (Venice, 1853), M. Amari’s Musulmani di Sicilia (1854–1875); F. Gregorovius’s Geschichte der Stadt Rom (Stuttgart, 1881), A. von Remondt’s Geschichte der Stadt Rom (Berlin, 1867), L. Cibari’s Storia della monarchia piemontese (Turin, 1840), and D. Carutti’s
ITEM—ITINERARIUM

Storia della diplomazia della corte di Savoia (Rome, 1875).

The Archivi storici e Dibattizioni di storia patria of the various Italian towns and provinces contain a great deal of valuable material for local history. From the point of view of papal history, L. von Ranke's History of the Popes (English edition, London, 1870). M. Creighton's History of the Papacy (London, 1897) and L. Pastor's Geschichte der Päpste (Freiburg i. B., 1866–1899), should be mentioned. From the point of view of general culture, Jacob Burckhardt's Cultural and Political History of the Renaissance in Italy (1862), E. Génerie's Révolutions d'Allemagne (Paris, 1872), and J. A. Symonds's Renaissance in Italy (5 vols., London, 1875, &c.) should be consulted. (L. V.)

ITEM (a Latin adverb meaning "also," "likewise") originally used adverbially in English at the beginning of each separate head in a list of articles, or each detail in an account book or ledger or in a legal document. The word is thus applied, as a noun, to the various heads in any such enumeration and also to a piece of information or news.

ITHACA (Itäen), vulgarly Thikai (Θικάι), next to Paxo the smallest of the seven Ionian Islands, with an area of about 44 sq. m. It forms an emporium of the nomos of Cephalaonia in the kingdom of Greece, and its population, which was 8973 in 1870, is now about 13,000. The island consists of two mountain masses, connected by a narrow isthmus of hills, and separated by a wide inlet of the sea known as the Gulf of Molo. The highest mountains are about 200 ft., and the southern in Hagios Stephanos, or Mount Merovigli (2100 ft.). Vathy (Βάθης = "deep"), the chief town and port of the island, lies at the northern foot of Mount Stephanos, its whitewashed houses stretching for about a mile round the deep bay in the Gulf of Molo, to which it owes its name. As there are only one or two small streams of arable land in Ithaca, the inhabitants are dependent on commerce for their grain supply; and olive oil, wine and currants are the principal products obtained by the cultivation of the thin stratum of soil that covers the calcareous rocks. Goats are fed in considerable number on the brushwood pasture of the hills; and hares (in spite of Aristotle's supposed assertion of their absence) are exceptionally abundant. The island is divided into four districts: Vathy, Aetos (or Eagle's Cliff), Ano (Ano) or Upland, and Exo (Exo) or Outland.

The name has remained attached to the island from the earliest historical times with but little interruption of the tradition; though in Brompton's travels (12th century) and in the old Venetian maps we find it called Fale or Val de Compar, and at a later date it not unfrequently appears as Litle Cephalaonia. This last name indicates the general character of Ithacan history (if history it can be called) in modern and indeed in ancient times; for the fame of the island is almost solely due to its position in the Homeric story of Odysseus. Ithaca, according to the Homeric epos, was the royal seat and residence of King Odysseus.

The island is incidentally described with no small variety of detail, picturesque and topographical; the Homeric localities for which counterparts have been sought are Mount Neritos, Mount Neion, the harbour of Phorcys, the town and palace of Odysseus, the fountain of Archa, the cave of the Naids, the stalls of the swineherd Eumaeus, the orchard of Laertes, the Korax or Raven Cliff and the island Asteris, where the suitors lay in ambush for Telemachus. Among the "identificationists" there are two schools, one placing it on the opposite coast of the Gulf of the island (Leake, Gladstone, &c.), and the other at Aetos on the isthmus. The latter site, which was advocated by Sir William Gell (Topography and Antiquities of Ithaca, London, 1867), was supported by Dr H. Schliemann, who carried on excavations in 1873 and 1878 (see H. Schliemann, Ithaca, le Péloponnèse, Troie, Paris, 1869, also published in German; his letter to The Times, 26th of September, 1878; and the author's life prefixed to Ilios, London, 1880). But his results were mainly negative. The fact is that no amount of ingenuity can reconcile the descriptions given in the Odyssey with the actual topography of this island. Above all, the passage in which the position of Ithaca is described offers great difficulties. "Now Ithaca lies low, farthest up the sea line towards the darkness, but those others face the dawning and the sun" (Butcher and Lang). Such a passage fits very ill an island lying, as Ithaca does, just to the east of Cephalaonia. Accordingly Professor W. Dörpfeld has suggested that the Homeric Ithaca is not on the island with the Venetian Greeks, but must be identified with Leucas (Santa Maura, &c.). He succeeds in fitting the Homeric topography to this latter island, and suggests that the name may have been transferred in consequence of a migration of the inhabitants. There is no doubt that Leucas fits the Homeric descriptions much better than Ithaca; but, on the other hand, many scholars maintain that it is a mistake to treat the imaginary descriptions of a poet as if they were portions of a guide-book, or to look, in the author of the Odyssey, for a close familiarity with the geography of the Ionian islands.

See, besides the works already referred to, the separate works on Ithaca by Schmieder (Leipzig, 1870); Rehbein von Lillienstern (Berlin, 1832); N. Karavia Givras (Τοπογραφία της Ιθακής) (Athens, 1839); Bowen (London, 1851); and Gandar, (Paris, 1854); Hercher, in Hermes (1866); Leake's Northern Greece; Mure's Tour in Greece; Hesse's Ober von Griechenland; Gladiotou, "The Dominioms of Ulysses," Mercantile's Magazine (1877) A history of the discussions will be found in Buchholz, Die Homerischen Reihen (Leipzig, 1871); Partsch, Kephallenia und Ithaka (1890); W. Dörpfeld in Mitlange's Perri, pp. 79-93 (1903); P. Goessels, Leukas-Ithaka (Saratoga Springs, 1904).

Ithaca, a city and the county-seat of Tompkins county, New York, U.S.A., at the southern end of Cayuga Lake, 60 m. S.W. of Syracuse. Pop. (1800) 11,079, (1900) 13,136, of whom 1310 were foreign-born, (1910 census) 14,802. It is served by the Delaware, Lackawanna & Western and the Lehigh Valley railways and by interurban electric line; and steamboats ply on the lake. Most of the city is in the level valley, from which it spreads up the heights on the south, east and west. The finest residential district is East Hill, particularly Cornell and Cayuga Heights, (fall Creek from the Cornell campus). Renwick Beach, at the head of the lake, is a pleasure resort. The neighbouring region is one of much beauty, and is frequented by summer tourists. Near the city are many waterfalls, the most notable being Taughannock Falls (91 m. N.), with a fall of 215 ft. Through the city from the east run Fall, Cascadilla and Six Mile Creeks, the first two of which have cut deep gorges and have a number of cascades and waterfalls, the largest, Ithaca Fall in Fall Creek, being 120 ft. high. Six Mile Creek crosses the south side of the city and empties into Cayuga Inlet, which crosses the western and lower districts, often inundated in the spring. The Inlet receives the waters of a number of small streams descending from the south-western hills. Among the attractions in this direction are Buttermilk Falls and ravine, on the outskirts of the city, Lick Brook Falls and Glen and Enfield Falls and Glen, the last 7 m. distant. Fall Creek furnishes good water-power. The city has various manufactures, including fire-arms, calendar clocks, traction engines, electrical appliances, patent chains, incubators, telephones, arslerian well drills, salt, cement, window glass and wallpaper. The value of the factory product increased from $1,500,604 in 1900 to $2,080,002 in 1905, 38-6%. Ithaca is also a farming centre and coal market, and much fruit is grown in the vicinity. The city is best known as the seat of Cornell University (q.v.). It has also the Ezra Cornell Free Library of about 38,000 volumes, the Ithaca Conservatory of Music, the Cascadilla School and the Ithaca High School. Ithaca was settled about 1780, the name being given to it by Simeon De Witt in 1806. It was incorporated as a village in 1821, and was chartered as a city in 1888. At Buttermilk Falls stood the principal village of the Tutelo Indians, Coreorgonel, settled in 1753 and destroyed in 1779 by a detachment of Sullivan's force.

ITINERARIUM (i.e. road-book, from Lat. iter, road), a term applied to the extant descriptions of the ancient Roman roads and routes of traffic, with the stations and distances. It is usual to distinguish two classes of these, Itineraria adnotata or scripta and Itineraria picta—the former having the character of a book, and the latter being a kind of travelling map. Of the Itineraria Scripta the most important are: (1) It. Antonini (see Antonini Itinerarium), which consists of two parts, the
one dealing with roads in Europe, Asia and Africa, and the other with familiar sea-routes—the distances usually being measured from Rome; (2) *Itinerarium Itinera* or *Bdrigalenum*, which belongs to the 4th century, and contains the route of a pilgrimage from Bordeaux to Jerusalem and from Heraclea by Rome to Milan (ed. G. Parthey and M. Find, 1848, with the *Itinera*). (3) *Itinerarium Antonini*; (4) *Itinerarium Alexandriae*, containing a sketch of the march-route of Alexander the Great, mainly derived from Arrian and prepared for Constantius’s expedition in A.D. 340–345 against the Persians (ed. D. Volkmann, 1871). A collected edition of the ancient itineraries, with ten maps, was issued by Fortia d’Urban, *Recueil des itinéraires anciens* (1845). Of the *Itineraries*, Picta (or) only one great example has been preserved. This is the famous *Tabula Peutingeriana*, which, without attending to the shape or relative position of the countries, represents by straight lines and dots of various sizes the roads and towns of the whole Roman world (facsimile published by K. Miller, 1888; see also Maskow in *Itius Portus*).

**ITIIUS PORTUS—**

The name given by Caesar to the chief harbour which he used when embarking for his second expedition to Britain in 44 B.C. (De bello Gallico, v. 2). It was certainly near the uplands round Cape Grisnez (Promontorium Ilium), but the exact site has been violently disputed ever since the renaissance of learning. Many critics have asserted that Caesar used the same port for his first expedition, but the name does not appear at all in that connection (B. G. iv. 21–23). This fact, coupled with other considerations, makes it probable that the two expeditions started from different places. It is generally agreed that the first embarked at Boulogne. The view was widely held about the second, but T. Rice Holmes in an article in the *Classical Review* (May 1909) gave strong reasons for preferring Wissant, 4 m. east of Grisnez. The chief reason is that Caesar, having found he could not set sail from the small harbour of Boulogne with even 80 ships simultaneously, decided that he would start from a port where the “more than 800” ships of the second expedition from Wissant would therefore have been “commodissimius” (v. 2) or opposed to “brevissimus trajectus” (iv. 21).

See T. R. Holmes in *Classical Review* (May 1909), in which he partially revises the conclusions at which he arrived in his *Ancient Britain* (1907), pp. 252–254; that the first expedition started from Boulogne is accepted, e.g. by H. Stuart Jones, in *English Historical Review* (1909), xxiv. 115; other authorities in Holmes’s article.

**ITO, HIROBUNI, PRINCE** (1841–1900), Japanese statesman, was born in 1841, being the son of Ito Jūzō, and (like his father) began life as a retainer of the lord of Chosho, one of the most powerful nobles of Japan. Choshu, in common with many of his fellow Daimyos, was bitterly opposed to the rule of the Shōgun of Tokugawa, and when this rule resulted in the conclusion of the treaty with Commodore M. C. Perry in 1854, the smouldering discontent broke out in open hostility against both parties to the compact. In these views Ito cordially agreed with his chieftain, and was sent on a secret mission to Porto to report to his lord on the doings of the government. This visit had the effect of causing Ito to turn his attention seriously to the study of the British and of other military systems. As a result he persuaded Choshu to remodel his army, and to exchange the bows and arrows of his men for guns and rifles. But Ito felt that his knowledge of foreigners, if it was to be thorough, should be sought for in Europe, and with the connivance of Choshu he, in company with Inouye and three other young men of the same rank as himself, determined to risk their lives by committing the then capital offence of visiting a foreign country. With great secrecy they made their way to Nagasaki, where they concluded an arrangement with the agent of Messrs Jardine, Matheson & Co. for passages on board a vessel which was about to sail for Shanghai (1863). At that port the adventurers separated, three of their number taking ship as passengers to London, while Ito and Inouye preferred to work their passages before the mast in the “Pegasus,” bound for the same destination. For a year these two friends remained in London studying English methods, but then events occurred in Japan which recalled them to their country. The treaties lately concluded by the shōgun with the foreign powers concealed the right to navigate the strait of Shimomoseki, leading to the Inland Sea. On the northern shores of this strait stretched the feudal state ruled over by Prince Choshu, who refused to recognize the clause opening the strait, and erected batteries on the shore, from which he opened fire on all ships which attempted to force the passage. The shōgun having declared himself unable in the circumstances to give effect to the provision, the treaty powers determined to take the matter into their own hands. Ito, who was better aware than his chief of the disproportion between the fighting powers of Europe and Japan, memorialized the cabinets, begging that hostilities should be suspended until he should have had time to use his influence with Choshu in the interests of peace. With this object Ito hurried back to Japan. But his efforts were futile. Choshu refused to give way, and suffered the consequences of his obstinacy in the destruction of his batteries and in the infliction of a heavy fine. The part played by Ito in these negotiations aroused the animosity of the more reactionary of his fellow-citizens, who made repeated attempts to assassinate him. On one notable occasion he was pursued by his enemies into a tea-house, where he was concealed by a young lady beneath the floor of her room. Thus began a romantic acquaintance, which ended in the lady becoming the wife of the fugitive. Subsequently (1868) Ito was made governor of Hiogo, and in the course of the following year became vice-minister of finance. In 1871 he accompanied Ikawara on an important mission to Europe, which, though diplomatically a failure, resulted in the enlistment of the services of European authorities on military, naval and educational systems.

After his return to Japan Ito served in several cabinets as head of the bureau of engineering and mines, and in 1886 he accepted office as prime minister, a post which, when he resigned in 1901, he had held four times. In 1882 he was sent on a mission to Europe to study the various forms of constitutional government; on this occasion he attended the coronation of the tsar Alexander III. On his return to Japan he was entrusted with the arduous duty of drafting a constitution. In 1890 he reaped the fruits of his labours, and nine years later he was destined to witness the abrogation of the old treaties, and the substitution in their place of conventions which place Japan on terms of equality with the European states. In all the great reforms in the Land of the Rising Sun Ito played a leading part. It was mainly due to his active interest in military and naval affairs that he was able to meet Li Hung-chang at the end of the Chinese and Japanese War (1895) as the representative of the conquering state, and the conclusion of the Anglo-Japanese Alliance in 1902 testified to his triumphant success in raising Japan to the first rank among civilised powers. As a reward for his conspicuous services in connexion with the Chinese War Ito was made a marquis, and in 1897 he accompanied Prince Arisugawa as a joint representative of the Mikado to the Diamond Jubilee of Queen Victoria. At the close of 1901 he again, though in an unofficial capacity, visited Europe and the United States; and in England he was created a G.C.B. After the Russo-Japanese War (1905) he was appointed resident general in Korea, and in that capacity he was responsible for the steps taken to increase Japanese influence in that country. In September 1907 he was advanced to the rank of prince. He retired from his post in Korea in July 1909, and became president of the privy council in Japan. But on the 26th of October, when on a visit to Harbin, he was shot dead by a Korean assassin.

He is to be distinguished from Admiral Count Yuko Ito (b. 1843), the diplomatist and naval commander.

**ITRIT**, a town of Campania, Italy, in the province of Caserta, 6 m. by road N.W. of Formia. Pop. (1901) 5797. The town is picturesquely situated 690 ft. above sea-level, in the mountains which the Via Appia traverses between Fondi and Formia.
Interesting remains of the substruction wall supporting the ancient road are preserved in Itzírí itself; and there are many remains of ancient buildings near it. The brigand Fra Diavolo, the hero of Auber's opera, was a native of Itzírí, and the place was once noted for brigandage.

**ITURBIDE** (or **Yturbiáé**), **AUGUSTIN DE** (1783-1824), emperor of Mexico from May 1822 to March 1823, was born on the 27th of September 1783, at Valladolid, now Morelia, in Mexico, where his father, an Old Spaniard from Pampeluna, had settled with his creole wife. After enjoying a better education than was then usual in Mexico, Iturbide entered the military service, and in 1810 held the post of lieutenant in the provincial regiment of his native city. In that year the insurrection under Hidalgo broke out, and Iturbide, more from policy, it would seem, than from principle, served in the royal army. Possessed of splendid courage and brilliant military talents, which fitted him especially for guerilla warfare, the young creole did signal service, and rapidly rose in military rank. In December 1813 Colonel Iturbide, along with General Llanó, dealt a crushing blow to the revolt by defeating Morelos, the successor of Hidalgo, in the battle of Valladolid; and the former followed it up by another decisive victory at Puruaran in January 1814. Next year Don Augustín was appointed to the command of the army of the north and to the governorship of the provinces of Valladolid and Guanajuato, but in 1816 grave charges of extortion and violence were brought against him, which led to his recall. Although the general was acquitted, or at least although the inquiry was dropped, he did not resume his commands, but retired into private life for four years, which, we are told, he spent in a rigid course of penance for his former excesses. In 1820 Apodaca, viceroy of Mexico, received instructions from the Spanish cortes to proclaim the constitution promulgated in Spain in 1812, but although obliged at first to submit to an order by which his power was much curtailed, he secretly cherished the design of reviving the absolute power for Ferdinand VII. in Mexico. Under pretext of putting down the lingering remains of revolt, he levied troops, and, placing Iturbide at their head, instructed him to proclaim the absolute power of the king. Four years of reflection, however, had modified the general's views, and now, led both by personal ambition and by patriotic regard for his country, Iturbide resolved to espouse the cause of national independence. His subsequent proceedings—how he issued the **Plan de Iguala**, on the 24th of February 1821, how by the refusal of the Spanish cortes to ratify the treaty of Cordova, which he had signed with O'Donojú, he was transformed from a mere champion of monarchy into a candidate for the crown, and how, hailed by the soldiers as Emperor Augustín I. on the 18th of May 1822, he was compelled within ten months, by his arrogant neglect of constitutional restraints, to tender his abdication to a congress which he had forcibly dissolved—will be found detailed under Mexico. Although the congress refused to accept his abdication on the ground that to do so would be to recognize the validity of his election, it permitted the ex-emperor to retire to Leghorn in Italy, while in consideration of his services in 1820 a yearly pension of £3,000 was conferred upon him. But Iturbide resolved to make one more bid for power; and in 1824, passing from Leghorn to London, he published a **Manifesto**, and on the 11th of May set sail for Mexico. The congress immediately issued an act of outlawry against him, forbidding him to set foot on Mexican soil on pain of death. Ignorant of this, the ex-emperor landed in disguise at Soto la Marina on the 14th of July. He was almost immediately recognized and arrested, and on the 19th of July 1824 was shot at Padilla, by order of the state of Tamaulipas, without being permitted an appeal to the general congress. Don Augustín de Iturbide is described by his contemporaries as being of handsome figure and ingratiating manner. His brilliant courage and wonderful success made him the idol of his soldiers, though towards his prisoners he displayed the most cold-blooded cruelty, boasting in one of his despatches of having honoured Good Friday by shooting three hundred excommuni- cated wretches. Though described as amiable in his private life, he seems in his public career to have been ambitious and unscrupulous, and by his haughty Spanish temper, impatient of all resistance or control, to have forfeited the opportunity of founding a secure imperial dynasty. His grandson Augustín was chosen by the ill-fated emperor Maximilian as his successor.

See **Statement of some of the principal events in the public life of Augustín de Iturbide**, written by himself (Eng. trans., 1824).

**ITZA**, an American-Indian people of Mayan stock, inhabiting the country around Lake Peten in northern Guatemala. Chichen-Itza, among the most wonderful of the ruined cities of Yucatan, was the capital of the Itzás. Thence, according to their traditions they removed, on the breaking up of the Mayan kingdom in 1420, to an island in the lake where another city was built. Cortes met them in 1525, but they preserved their independence till 1697, when the Spaniards destroyed the city and temples, and a library of sacred books, written in hieroglyphics on bark fibre. The Itzas were one of the eighteen semi-independent Mayan states, whose incessant internecine wars at length brought about the dismemberment of the empire of Xibalba and the destruction of Mayan civilization.

**ITZEBHOE** (or **Itzebeh**), a town of Germany, in the Prussian province of Schleswig-Holstein, on the Stör, a navigable tributary of the Elbe, 32 m. north-west of Hamburg and 15 m. north of Glückstadt. Pop. (1900) 15,649. The church of St Lawrence, dating from the 12th century, and the building in which the Holstein estates formerly met, are noteworthy. The town has a convent founded in 1256, a high school, a hospital and other benevolent institutions. Itzebhoë is a busy commercial place. Its sugar refineries are among the largest in Germany. Iron founding, shipbuilding and wool-spinning are also carried on, and the manufactures include machinery, tobacco, fishing-nets, chicory, soap, cement and beer. Fishing employs some of the inhabitants, and the markets for cattle and horses are important. A considerable trade is carried on in agricultural products and wood, chiefly with Hamburg and Altona.

Itzebhoë is the oldest town in Holstein. Its nucleus was a castle, built in 890 by Egbert, one of Charlemagne's counts, against the Danes. The community which sprang up around it was diversely called Esseveldburg, Eslesfeld and Ezeho. In 1201 the town was destroyed, but it was restored in 1224. To the new town the Lübeck rights were granted by Adolphus IV. in 1235, and to the old town in 1303. During the Thirty Years' War Itzebhoë was twice destroyed by the Swedes, in 1644 and 1657, but was rebuilt on each occasion. It passed to Prussia in 1867, with the duchy of Schleswig-Holstein.

**IUKA**, the county-seat of Tishomingo county, Mississippi, U.S.A., about 25 m. S.E. of Corinth in the N.E. corner of the state and 8 m. S. of the Tennessee river. Pop. (1900) 882; (1910) 1221. It is served by the Southern railway, and has a considerable trade in cotton and farm products. Its mineral springs make it a health resort. In the American Civil War, a Confederate force under General Sterling Price occupied the town on the 14th of September 1862, driving out a small Union garrison; and on the 19th of September a partial engagement took place between Price and a Federal column commanded by General Rosecrans, in which the Confederate losses were 700 and the Union 700. Price, whose line of retreat was threatened by superior forces under General Grant, withdrew from Iuka on the morning of the 20th of September.

**IULUS**, in Roman legend: (a) the eldest son of Ascanius and grandson of Aeneas, founder of the Julian gens (gens Iulia), deprived of his kingdom of Lutum by his younger brother Silvius (Dion. Halic. i. 70); (b) another name for, or epithet of, Ascanius.

**IVAN** (John), the name of six grand dukes of Muscovy and tsars of Russia.

Ivan I., called Kalija, or Money-Bag (d. 1341), grand duke of Vladimir, was the first sobiratel, or "gatherer," of the scattered Russian lands, thereby laying the foundations of the future autocracy as a national institution. This he contrived to do by adopting a policy of complete subserviency to the khan of the Golden Horde, who, in return for a liberal and punctual tribute, permitted him to aggrandize himself at the expense of the lesser
IVAN

grand dukes. Moscow and Tver were the first to fall. The latter Ivan received from the hand of the khan, after devastating it with a host of 50,000 Tatars (1327). When Alexander of Tver fled to the powerful city of Pskov, Ivan, not strong enough to attack Pskov, procured the banishment of Alexander by the aid of the metropolitan, Theognost, who threatened Pskov with an interdict. In 1330 Ivan extended his influence over Rostov by the drastic methods of blackmail and hanging. But Great Novgorod was too strong for him, and twice he threatened that republic in vain. In 1340 Ivan assisted the khan to ravage the domains of Prince Ivan of Smolensk, who had refused to pay the customary tribute to the Horde. Ivan's own domains, at any rate during his reign, remained free from Tatar incursions, and prospered correspondingly, thus attracting immigrants and their wealth from the other surrounding principalities. Ivan was a most careful, not to say niggardly, economist, keeping an exact account of every village or piece of plate that his moneybags acquired, whence his nickname. The most important event of his reign was the transference of the metropolitan see from Vladimir to Moscow, which gave Muscovy the pre-eminence over all the other Russian states, and made the metropolitan the ecclesiastical police-superintendent of the grand duke. The Metropolitan Peter built the first stone cathedral of Moscow, and his successor, Theognost, followed suit with three more stone churches. Simultaneously Ivan substituted stone walls for the ancient wooden ones of the Kreml', or citadel, which made Moscow a still safer place of refuge.

See S. M. Solovev, History of Russia (Rus.), vol. iii. (St Petersburg, 1895); Polezhaev, The Principality of Moscow in the first half of the 14th Century (Rus.) (St Petersburg, 1878).

IVAN II. (1326–1350), grand duke of Vladimir, a younger son of Ivan Kalita, was born in 1326. In 1353 he succeeded his elder brother Simeon as grand duke, despite the competition of Prince Constantine of Suzdal, the Khan Hanibek preferring to bestow the yarluik, or letter of investiture, upon Ivan rather than upon Constantine. At first the principalities of Suzdal, Kyazan and the republic of Novgorod refused to recognize him as grand duke, and waged war with him till 1354. The author of the grand duchy sensibly diminished during the reign of Ivan II. The surrounding principalities paid but little attention to Moscow, and Ivan, "a meek, gentle and merciful prince," was ruled to a great extent by the tsuizatsky, or chiliarich, Alexis Khvost, and, after his murder by the jealous boyars in 1357, by Bishop Alexis. He died in 1359. Like most of his predecessors, Ivan, by his last will, divided his dominions among his children.

See Dmitry Ilovaisky, History of Russia (Rus.), vol. ii. (Moscow, 1876–1894).

IVAN III. (1440–1505), grand duke of Muscovy, son of Vasily (Basil) Vasilievich the Blind, grand duke of Moscow, and Maria Yaroslavovna, was born in 1440. He was co-regent with his father during the latter years of his life and succeeded him in 1462. Ivan tenaciously pursued the unifying policy of his predecessors. Nevertheless, cautious to timidity, like most of the princes of the house of Rurik, he avoided as far as possible any violent collision with his neighbours until all the circumstances were exceptionally favourable, always preferring to attain his ends gradually, circuitously and subterraneously. Muscovy had by this time, under Ivan III, grown into a compact and powerful state, whilst her rivals had grown sensibly weaker, a condition of things very favourable to the speculative activity of a statesman of Ivan III.'s peculiar character. His first enterprise was a war with the republic of Novgorod, which, alarmed at the growing dominancy of Muscovy, had placed herself beneath the protection of Casimir IV., king of Poland, an alliance regarded at Moscow as an act of apostasy from orthodoxy. Ivan took the field against Novgorod in 1470, and after his generals had twice defeated the forces of the republic, at Shelona and on the Dvina, during the summer of 1471, the Novgorodians were forced to sue for peace, which they obtained on engaging to abandon for ever the Polish alliance, ceding a considerable portion of their northern colonies, and paying a war indemnity of 15,500 roubles. From henceforth Ivan sought continually a pretext for destroying Novgorod altogether; but though he frequently violated its ancient privileges in minor matters, the attitude of the republic was so wary that his looked-for opportunity did not come till 1477. In that year the ambassadors of Novgorod played into his hands by addressing him in public audience as "Gosudar" (sovereign) instead of "Gospodin" ("Sir") as heretofore. Ivan at once seized upon this as a recognition of his sovereignty, and when the Novgorodians repudiated their ambassadors, he marched against them. Deserted by Casimir IV., and surrounded on every side by the Muscovite armies, which included a Tatar contingent, the republic recognized Ivan as autocrat, and surrendered (January 14, 1478) all her prerogatives and possessions (the latter including the whole of northern Russia from Lapland to the Urals) into his hands. Subsequent revolts (1479–1488) were punished by the removal en masse of the richest and most ancient families of Novgorod to Moscow, Vyatka and other central Russian cities. After this, Novgorod, as an independent state, ceased to exist. The rival republic of Pskov owed the continuance of its own political existence to the readiness with which it assisted Ivan against its ancient enemy. The other principalities were virtually absorbed, by conquest, purchase or marriage contract—Yaroslavl in 1493, Rostov in 1474, Tver in 1485.

Ivan's refusal to share his conquests with his brothers, and his subsequent interference with the internal politics of their inherited principalities, involved him in several wars with them, from which, though the princes were assisted by Lithuania, he emerged victorious. Finally, Ivan's new rule of government, formally set forth in his last will to the effect that the domains of all his kinsfolk, after their deaths, should pass directly to the reigning grand duke instead of reverting, as hitherto, to the princes' heirs, put an end once for all to these semi-independent princedoms. The further extension of the Muscovite dominion was facilitated by the death of Casimir IV. in 1492, when Poland and Lithuania once more parted company. The throne of Lithuania was now occupied by Casimir's son Alexander, a weak and lethargic prince so incapable of defending his possessions against the persistent attacks of the Muscovites that he attempted to save them by a matrimonial compact, and wedded Helena, Ivan's daughter. But the clear determination of Ivan to appropriate as much of Lithuania as possible at last compelled Alexander in 1499 to take up arms against his father-in-law. The Lithuanians were routed at Vedrosha (July 14, 1500), and in 1503 Alexander was glad to purchase peace by ceding to Ivan Chernigov, Starodub, Novgorod-Syversk and sixteen other towns.

It was in the reign of Ivan III. that Muscovy rejected the Tatar yoke. In 1480 Ivan refused to pay the customary tribute to the grand Khan Ahmed. When, however, the grand khan marched against him, Ivan's courage began to fail, and only the stern exhortations of the high-spirited bishop of Rostov, Vassian, could induce him to take the field. All through the autumn the Russian and Tatar hosts confronted each other on opposite sides of the Ugra, till the 11th of November, when Ahmed retired into the steppe. In the following year the grand khan, while preparing a second expedition against Moscow, was suddenly attacked, routed and slain by Ivan, the khan of the Nogai Tatars, whereupon the Golden Horde suddenly fell to pieces. In 1487 Ivan reduced the khanate of Kazan (one of the offshoots of the Horde) to the condition of a vassal-state, though in his later years it broke away from his suzerainty. With the other Mahomedan powers, the khan of the Crimea and the sultan of Turkey, Ivan's relations were pacific and even amicable. The Crimean khan, Mengli Girai, helped him against Lithuania and facilitated the opening of diplomatic intercourse between Moscow and Constantinople, where the first Russian embassy appeared in 1495.

The character of the government of Muscovy under Ivan III. changed essentially and took on an autocratic form which it had never had before. This was due not merely to the natural consequence of the hegemony of Moscow over the other Russian lands, but even more to the simultaneous growth of new and
exotic principles falling upon a soil already prepared for them. After the fall of Constantinople, orthodox canons were inclined to regard the Muscovite grand dukes as the successors by the Byzantine emperors. This movement coincided with a change in the family circumstances of Ivan III. After the death of his first consort, Maria of Tver (1467), at the suggestion of Pope Paul II. (1466), who hoped thereby to bind Russia to the holy see, Ivan III wedded the Catholic Zoe Palaeologa (better known by her orthodox name of Sophia), daughter of Thomas, despot of the Morea, who claimed the throne of Constantinople as the nearest relative of the last Greek emperor. The princess, however, clave to her family traditions, and awoke imperial ideas in the mind of her consort. It was through her influence that the ceremonial etiquette of Constantinople (along with the imperial double-headed eagle and all that it implied) was adopted by the court of Moscow. The grand duke henceforth held aloof from his boyars. The old patriarchal systems of government vanished. The boyars were no longer consulted on affairs of state. The sovereign became sacrosanct, while the boyars were reduced to the level of slaves absolutely dependent on the will of the sovereign. The boyars naturally resented so insulting a revolution, and it was not many years before the first enmity was roused against them. For this clever Greek lady prevailed in the end, and it was her son Vasily, not Maria of Tver's son, Demetrius, who was ultimately crowned co-regent with his father (April 14, 1502). It was in the reign of Ivan III. that the first Russian "Law Book," or code, was compiled by the scribe Gusev. Ivan did his utmost to promote civilization in his realm, and with that object invited many foreign masters and artificers to settle in Muscovy, the most noted of whom was the Italian Ridolfo di Fioravante, nicknamed Aristote because of his extraordinary knowledge, who built the cathedrals of the Assumption (Uspenski) and of St. Michael or the Holy Archangels in the Kremlin.

See P. Fering, Mariage d'un tsar au Vatican, Ivan III et Sophie Paleologue (Paris, 1894); E. I. Kashirsky, The Struggle of Ivan III. with Sigismond I. (Russ.) (Nizhni, 1899); S. M. Solovev, History of Russia (Russ.), vol. v. (St. Petersburg, 1895).

Ivan IV., called "the Terrible" (1530-1584), tsar of Muscovy, was the son of Vasily [Basil] III. Ivanovich, grand duke of Muscovy, by his second wife, Elena Gliniska. Born on the 25th of August 1530, he was proclaimed grand duke on the death of his father (1533), and took the government into his own hands in 1544, being then fourteen years old. Ivan IV. was in every respect precocious; but from the first there was whole something of a neurotic strain in his character. His father died when he was three, his mother when he was only seven, and he grew up in a brutal and degrading environment where he learnt to hold human life and human dignity in contempt. He was maltreated by the leading boyars whom successive revolutions placed at the head of affairs, and hence he conceived an inextinguishable hatred of their whole order and a corresponding fondness for the merchant class, their natural enemies. At a very early age he entertain an exalted idea of his own divine authority, and his studies were largely devoted to searching in the Scriptures and the Slavonic chronicles for sanctions and precedents for the exercise and development of his right divine. He first asserted his power by literally throwing to the dogs the last of his boyar tyrants, and shortly afterwards announced his intention of assuming the title of tsar, a title which his father and grandfather had coveted but never dared to assume publicly. On the 16th of January 1547, he was crowned the first Russian tsar by the metropolitan of Moscow; on the 2nd of February in the same year he selected and enthroned a virgin among the virgins gathered from all parts of Russia for his inspection, Anastasia Zakharina-Koshkina, the scion of an ancient and noble family better known by its later name of Romanov.

Hitherto, by his own showing, the private life of the young tsar had been unspeakably abominable, but his sensitive conscience (he was naturally religious) induced him, in 1550, to summon a Zemsky Sobor or national assembly, the first of its kind, to which he made a curious public confession of the sins of his youth, and at the same time promised that the realm of Russia (for whose dilapidation he blamed the boyar regents) should henceforth be governed justly and mercifully. In 1551 the tsar submitted to a synod of prelates a hundred questions as to the best mode of remedying existing evils, for which reason the decrees of this synod are generally called stolov or centuria. The decennium extending from 1550 to 1560 was the good period of Ivan IV.'s reign, when he deliberately broke away from his disreputable past and surrounded himself with good men of lowly origin. It was not only that he hated and distrusted the boyars, but that he was already statesman enough to discern that they could not be fitted into the new order of things which he aimed at introducing. Ivan mediated the regeneration of Muscovy, and the only men who could assist him in his task were men who could look steadily forward to the future because they had no past to look back upon, men who would unflinchingly obey their sovereign because they owed their whole political significance to him alone. The chief of these men of good-will were Alexi Adashev and the monk Sylvester, men of so obscure an origin that almost every detail of their lives is conjectural, but of both of them, morally, the best Muscovites of their day. Their influence upon the young tsar was profoundly beneficial, and the period of their administration coincides with the most glorious period of Ivan's reign—the period of the conquest of Kazan and Astrakhan.

In the course of 1551 one of the factions of Kazan offered the whole khanate to the young tsar, and on the 20th of August 1552 he stood before its walls with an army of 150,000 men and 50 guns. The siege was long and costly; the army suffered severely; and only the tenacity of the tsar kept it in camp for six weeks. But on the 2nd of October the fortress, which had been heroically defended, was taken by assault. The conquest of Kazan was an epoch-making event in the history of eastern Europe. It was not only the first territorial conquest from the Tatars, before whom Muscovy had humbled herself for generations; at Kazan Asia, in the name of Mahomet, had fought behind its last trench against Christian Europe marshalled beneath the banner of the tsar of Muscovy. For the first time the Volga became a Russian river. Nothing could now retard the natural advance of the young Russian state towards the east and the south-east. In 1553 Astrakhan fell almost without a blow. By 1560 all the Finnic and Tatar tribes between the Oka and the Kazan had become Russian subjects. Ivan was also the first tsar who dared to attack the Crimea. In 1555 he sent Ivan Shcheremetev against Perekop, and Shcheremetev routed the Tatars in a great two days' battle at Sudushenskaya. Some of Ivan's advisers, including both Sylvester and Adashev, now advised him to make an end of the Crimean khanate, as he had already made an end of the khanates of Kazan and Astrakhan. But Ivan, wiser in his generation, knew that the thing was impossible, in view of the immense distance to be traversed, and the predominance of the Grand Turk from whom it would have to be wrested. It was upon Livonia that his eyes were fixed, which was comparatively near at hand and promised him a seaboard and direct communication with western Europe. Ivan IV., like Peter I. after him, clearly recognized the necessity of raising Muscovy to the level of her neighbours. He proposed to do so by promoting a wholesale immigration into his tsardom of master-workmen and skilled artificers. But all his neighbours, apprehensive of the consequences of a civilized Muscovy, combined to thwart him. Charles V. even went so far as to disperse 125 skilled German whom Ivan's agent had collected and brought to Livonia to a Baltic port. After this, Ivan was obliged to help himself as best he could. His opportunity seemed to have come when, in the middle of the 16th century, the Order of the Sword broke up, and the possession of Livonia was fiercely contested between Sweden, Poland and Denmark. Ivan intervened in 1558 and quickly captured Narva, Dorpat and a dozen smaller fortresses; then, in 1560, Livonia placed herself beneath the protection of Poland, and King Sigismund II. warned Ivan off the premises.

By this time, Ivan had entered upon the second and evil portion of his reign. As early as 1553 he had ceased to
Sylvester and Asadash, owing to their extraordinary backwardness in supporting the claims of his infant son to the throne while he himself lay at the point of death. The ambitious and ungrateful conduct of the tsar’s intimate friends and protégés on this occasion has never been satisfactorily explained, and he had good reason to resent it. Nevertheless, on his recovery, much to his credit, he overlooked it, and they continued to direct affairs for six years longer. Then the dispute about the Crimea arose, and Ivan became convinced that they were mediocre politicians as well as untrustworthy friends. In 1560 both of them disappeared from the scene, Sylvester into a monastery at his own request, while Asadash died the same year, in honourable exile as a general in Livonia. The death of his deeply beloved consort Anastasia and his son Demetrius, and the desertion of his one bosom friend Prince Kurbsky, about the same time, seem to have infuriated Ivan against God and man. During the next ten years (1560–1570) terrible and horrible things happened in the realm of Muscovy. The tsar himself lived in an atmosphere of apprehension, imagining that every man’s hand was against him. On the 3rd of December 1566 he quit Moscow with his whole family. On the 3rd of January 1567 he declared in an open letter addressed to the metropolitan his intention to abdicate. The common people, whom he had always favoured at the expense of the boyars, thereupon implored him to come back on his own terms. He consented to do so, but entrenched himself within a peculiar institution, the oprichina or “separate estate.” Certain towns and districts all over Russia were separated from the rest of the realm, and their revenues were assigned to the maintenance of the tsar’s new court and household, which was to consist of 1000 carefully selected boyars and lower dignitaries, with their families and suites, in the midst of whom Ivan henceforth lived exclusively. The oprichina was no constitutional innovation. The duma, or council, still attended to all the details of the administration; the old boyars still retained their ancient offices and dignities. The only difference was that the tsar took his hird and hung them up, and they were not even to communicate with him except on extraordinary and exceptional occasions. The oprichniki, as being the exclusive favourites of the tsar, naturally, in their own interests, hardened the tsar’s heart against all outsiders, and trampled with impunity upon every one beyond the charmed circle. Their first and most notable victim was Philip, the saintly metropolitan of Moscow, who was strangled for condemnation the oprichina as an unchristian institution, and refusing to bless the tsar (1569). Ivan had stopped at Tver, to murder St Philip, while on his way to destroy the second wealthiest city in his tsardom—Great Novgorod. A delator of infamous character, one Peter, had accused the authorities of the city to the tsar of conspiracy; Ivan, without even confronting the Novgorodians with their accuser, proceeded at the end of 1569 to punish them. After ravaging the land, his own land, like a wild beast, he entered the city on the 8th of January 1570, and held it for the next five weeks, systematically and deliberately, day after day, massacred batches of every class of the population. Every monastery, church, manor-house, warehouse and farm within a circuit of 100 m, was then wrecked, plundered and left roofless, all goods were pillaged, all cattle destroyed. Not till the 13th of February were the miserable remnants of the population permitted to rebuild their houses and cultivate their fields once more.

An intermittent and desultory war, with Sweden and Poland simultaneously, for the possession of Livonia and Estonia, went on from 1560 to 1582. Ivan’s generals (he himself rarely took the field) were generally successful at first, and bore down their enemies by sheer numbers, capturing scores of fortresses and towns. But in the end the superior military efficiency of the Swedes and Poles invariably prevailed. Ivan was also unfortunate in having for his chief antagonist Stephen Báthory, one of the greatest captains of the age. Thus all his strenuous efforts, all his enormous sacrifices, came to nothing. The West was too strong for him. By the peace of Zapoli (January 15th, 1582) he surrendered Livonia with Pultusk to Báthory, and by
sake, he would quarrel no longer with his dear brother." During the reign of his colleague Peter, Ivan V took no part whatever in affairs, but devoted himself "to incessant prayer and rigorous fasting." On the 9th of January 1684 he married Praskovia Saltukova, who bore him five daughters, one of whom, Anne, ultimately ascended the Russian throne. In his last years Ivan was a paralytic. He died on the 29th of January 1696.

IVAN VI. (1740–1764), emperor of Russia, was the son of Prince Antony Ulrich of Brunswick, and the princess Anna Leopoldovna of Mecklenburg, and great-nephew of the empress Anna, who adopted him and declared him her successor on the 5th of October 1740, when he was only eight weeks old. On the death of Anne (October 17th) he was proclaimed emperor, and on the following day Ernst Johann Biren, duke of Courland, was appointed regent. On the fall of Biren (November 8th), the regency passed to the baby tsar’s mother, through his guardian, and the accession was in the hands of the capable vice-chancellor, Andrei Osterman. A little more than twelve months later, a coup d’état placed the tsarevna Elizabeth on the throne (December 6, 1741), and Ivan and his family were imprisoned in the fortress of Dünabünde (Ust Dinvs) (December 13, 1742) after a preliminary detention at Riga, from whence the new empress had at first decided to send them home to Brunswick. In June 1744 they were transferred to Kholmogory on the White Sea, where Ivan, isolated from his family, and seeing nobody but his gaoler, remained for the next twelve years. Rumours of his confinement at Kholmogory having leaked out, he was secretly transferred to the fortress of Schlüsselburg (1756), where he was still more rigorously guarded, the very commandant of the fortress not knowing who “a certain arrestant” committed to his care really was. On the accession of Peter III. the condition of the unfortunate prisoner seemed about to be ameliorated, for the kind-hearted emperor visited and sympathized with him; but Peter himself was overthrown a few weeks later. In the instructions sent to Ivan’s guardian, Prince Chashmetus, the latter was ordered to order his charge, and even scourge him should he become refractory. On the accession of Catherine still more stringent orders were sent to the officer in charge of “the nameless one.” If any attempt were made from outside to release him, the prisoner was to be put to death; in no circumstances he was to be delivered alive into any one’s hands, even if his deliverers produced, the empress’s own manual authorizing his release. By this time, twenty years of solitary confinement had disturbed Ivan’s mental equilibrium, though he does not seem to have been actually insane. Nevertheless, despite the mystery surrounding him, he was well aware of his imperial origin, and always called himself gosudar(sovereign).

Though instructions had been given to keep him ignorant, he had been taught his letters and could read his Bible. Nor could his residence at Schlüsselburg remain concealed for ever, and its discovery was the cause of his ruin. A sub-lieutenant of the garrison, Vasily Mirovich, found out all about him, and formed a plan for freeing and proclaiming him emperor. At midnight on the 5th of July 1746, Mirovich won over some of the garrison, arrested the commandant, Beresudnikov, and demanded Ivan’s delivery, who there and then was murdered by his gaoler’s obedience to the secret instructions already in their possession.

IVANOROD—IVORY, SIR J.

IVANOV—VOZNESENSK, a town of middle Russia, in the government of Vladimir, 86 m. by rail N. of the town of Vladimir. Pop. (1887) 22,000; (1900) 64,628. It consists of what were originally two villages—Ivanovo, dating from the 16th century, and Voznesensk, of much more recent date—united into a town in 1861. Of best note among the public buildings are the cathedral, and the church of the Intercession of the Virgin, formerly associated with an important monastery founded in 1579 and abandoned in 1754. One of the colleges of the town contains a public library. Linen-weaving was introduced in 1753, and in 1776 the manufacture of chintzes was brought from Schlüsselburg. The town has cotton factories, calico print-works, iron-works and chemical works.

IVARR, BEINLAUSI (d. 873), son of Ragnar Lothbrok, the great Viking chieftain, is known in English and Continental annals as Imaur, Ingvar or Hingwar. He was one of the Danish leaders in the Shippew expedition of 855 and was perhaps present at the siege of York in 867. The chief incident in his history is his capture by the Danes in 871. He was condemned to death and was beheaded, and his head and heart were sent to Harald Fairhair. He seems to have been the leader of the Danes on that occasion, and by this act he probably gained the epithet “crudeissimus” by which he is usually described. It is probable that he is to be identified with Imhar, king of the Norsemen of all Ireland and Britain, who was active in Ireland between the years 852 and 873, the year of his death.

IVIZA, IBIZA OR IVIÇA, an island in the Mediterranean Sea, belonging to Spain, and forming part of the archipelago known as the Balearic Islands (q.v.). Pop. (1900) 23,524; area 228 sq. m. Ivisa lies 30 m. S.W. of Majorca and about 60 m. from Cape San Martin on the coast of Spain. Its greatest length from north-east to south-west is about 25 m. and its greatest breadth about 13 m. The coast is indented by numerous small bays, the principal of which are those of San Antonio on the north-west, and of Ivisa on the south-east. Of all the Balearic group, Ivisa is the most varied in its scenery and the most fruitful. The hilly parts which culminate in the Pico de Atalaya (1560 ft.), are richly wooded. The climate is for the most part mild and agreeable, though the hot winds from the African coast are sometimes very oppressive. Oil, corn and fruits (of which the most important are the fig, prickly pear, almond and carob-bean) are the principal products; hemp and flax are also grown, but the inhabitants are rather indolent, and their modes of culture are very primitive. There are numerous salt-pans along the coast, which were formerly worked by the Spanish government. Fruit, salt, charcoal, lead and stockings of native manufacture are exported. The imports are rice, flour, sugar, woolen goods and cotton. The capital of the island, and, indeed, the only town of much importance—for the population is remarkably scattered—is Ivisa or La Ciudad (637), a fortified town on the south-east coast, consisting of a lower and upper portion, and possessing a good harbour, a 13th-century Gothic collegiate church and an ancient castle. Ivisa was the see of a bishop from 1782 to 1851.

South of Ivisa lies the smaller and more irregular island of Formentera (pop., 1900, 2243; area, 37 sq. m.), which is said to derive its name from the production of wheat. With Ivisa it acts both in general appearance and in the character of its products, but it is altogether inferior in size. Goats and sheep are found in the mountains, while the coast is greatly frequented by flamingoes. Ivisa and Formentera are the principal islands of the lesser or western Balearic group, formerly known as the Pityusae or Pine Islands.

IVORY, SIR JAMES (1765–1842), Scottish mathematician, was born in Dundee in 1765. In 1779 he entered the university of St Andrews, distinguishing himself especially in mathematics. He then studied theology; but, after two sessions at St Andrews and one at Edinburgh, he abandoned all idea of the church, and in 1786 he became an assistant-teacher of mathematics and natural philosophy in a newly established academy at Dundee. Three years later he became partner in and manager of a flax-spinning company at Douglastown in Forfarshire, still, however, prosecuting in moments of leisure his favourite studies. He was essentially a self-taught mathematician, and was not only deeply
IVORY

versed in ancient and modern geometry, but also had a full knowledge of the analytical methods and discoveries of the continental mathematicians. His earliest memoir, dealing with an analytical expression for the rectification of the ellipse, is published in the Transactions of the Royal Society of Edinburgh (1796); and this and his later papers on “Cubic Equations” (1799) and “Kepler’s Problem” (1802) evince great facility in the handling of algebraic formulae. In 1804 after the dissolution of the flax-spinning company of which he was manager, he obtained one of the mathematical chairs in the Royal Military College at Marlow (afterwards removed to Sandhurst); and till the year 1816, when failing health obliged him to resign, he discharged his professional duties with remarkable success. During this period he published in the Philosophical Transactions several important memoirs, which earned for him the Copley medal in 1814 and ensured his election as a Fellow of the Royal Society in 1815. Of special importance in the history of attractions is the first of these earlier memoirs (Phil. Trans., 1809), in which the problem of the attraction of a homogeneous ellipsoid upon an external point is reduced to the simpler case of the attraction of another but related ellipsoid upon a corresponding point interior to it. This theorem is known as Ivory’s theorem. His later papers in the Transactions treat of astronomical refractions, of planetary perturbations, of equilibrium of fluid masses, &c. For his investigations in the first named of these he received a royal medal in 1826 and again in 1839. In 1831, on the recommendation of Lord Brougham, King William IV. granted him a pension of £200 per annum, and conferred on him the Hanoverian Guelphic order of knighthood. Besides being directly connected with the chief scientific societies of his own country, the Royal Society of Edinburgh, the Royal Irish Academy, &c., he was corresponding member of the Royal Academy of Sciences both of Paris and Berlin, and of the Royal Society of Göttingen. He died at London on the 21st of September 1842.

A list of his works is given in the Catalogue of Scientific Papers of the Royal Society of London.

IVORY (Fr. ivoire, Lat. ébur), strictly speaking a term confined to the material represented by the tusk of the elephant, and for commercial purposes almost entirely to that of the male elephant. In Africa both the male and female elephant produce good-sized tusks; in the Indian variety the female is much less bountifully provided, and in Ceylon perhaps not more than a 1/3 of either sex having any tusks at all. Ivory is in substance very dense, the cores close and compact and filled with a gelatinous solution which contributes to the beautiful polish which may be given to it and makes it easy to work. It may be placed between bone and horn; more fibrous than bone and therefore less easily torn or splintered. For a scientific definition it would be difficult to find a better one than that given by Sir Richard Owen. He says: 1

“The name ivory is now restricted to that modification of dentine or tooth substance which in transverse sections or fractures shows lines of different colours, or striae, proceeding in the arc of a circle and forming by their decussations minute curvilinear lozenge-shaped spaces.” These spaces are formed by an immense number of exceedingly minute tubes placed very close together, radiating outwards in all directions. It is to this arrangement of structure that ivory owes its fine grain and almost perfect elasticity, and the peculiar marking resembling the engine-turning on the case of a watch, by which many people are guided in distinguishing it from celluloid or other imitations. Elephants’ tusks are the upper incisor teeth of the animal, which, starting from a semi-solid vascular pulp, grow during the whole of its existence, gathering phosphate and other earthy matters and becoming hardened as in the formation of teeth generally. The tusk is built up in layers, the inside layer being the last produced. A large proportion is embedded in the bone sockets of the skull, and is hollow for some distance up in a conical form, the hollow becoming less and less as it is prolonged into a narrow channel which runs along as a thread or as it is sometimes called, nerve, towards the point of the tooth. The outer layer, or bark, is enamel of similar density to the central part. Besides the elephant’s tooth or tusk we recognize as ivory, for commercial purposes, the teeth of the hippopotamus, walrus, narwhal, cachalot or sperm-whale and of some animals of the wild boar class, such as the warthog of South Africa. Practically, however, amongst these the hippo and walrus tusks are the only ones of importance for large work, though boars’ tusks come to the sale-rooms in considerable quantities from India and Africa.

Generally speaking, the supply of ivory imported into Europe comes from Africa; some is Asiatic, but much that is shipped from India is really African, coming by way of Zanzibar and Mozambique to Bombay. A certain amount is furnished by the vast stores of remains of prehistoric animals still existing throughout Russia, principally in Siberia in the neighbourhood of the Lena and other rivers discharging into the Arctic Ocean. The mammoth and mastodon seem at one time to have been common over the whole surface of the globe. In England tusks have been recently dug up—for instance at Dungeness—as long as 12 ft. and weighing 200 lb. The Siberian deposits have been worked for now nearly two centuries. The store appears to be inexhaustible as a coalfield. Some think that a day may come when the spread of civilization may cause the utter disappearance of the elephant in Africa, and that it will be to these deposits that the demand for ivory is to be supplied. Of late years in England the use of mammoth ivory has shown signs of decline. Practically none passed through the London sale-rooms during 1903–1906. Before that, parcels of 10 to 20 tons were not uncommon. Not all of it is good; perhaps about half of what comes to England is so, the rest rotten; specimens, however, are found as perfect and in as fine condition as if recently killed, instead of having lain hidden and preserved for thousands of years in the icy ground. There is a considerable literature (see SHOOTING) on the subject of big-game hunting, which includes that of the elephant, hippopotamus and smaller tusk-bearing animals. Elephants until comparatively recent times roamed over the whole of Africa from the northern deserts to the Cape of Good Hope. They are still abundant in Central Africa and Uganda, but civilization has gradually driven them farther and farther into the wilds and impenetrable forests of the interior.

The quality of ivory varies according to the districts whence it is obtained, the soft variety of the eastern parts of the continent being the most esteemed. When in perfect condition African ivory should be about the same weight as the same volume of vegetable ivory, but is not so fine a white, transparent mellow tint, with as little as possible appearance of grain or motting. Asiatic ivory is of a denser white, more open in texture and softer to work. But it is apt to turn yellow sooner, and is not so easy to polish. Unlike bone, ivory requires no preparation, but is fit for immediate working. That from the neighbourhood of Cameroon is very good, then ranks the ivory from Loango, Congo, Gabun and Ambriz; next the Gold Coast, Sierra Leone and Cape Coast Castle. That of French Sudan is nearly always “ringy,” and some of the Ambriz variety also.

We may call Zanzibar and Mozambique varieties soft; Angola and Ambriz all hard. Ambriz ivory was at one time much esteemed, but there is comparatively little now. Siam ivory is rarely if ever soft. Abyssinian has its soft side, but Egypt is practically the only place where both descriptions are largely distributed. A drawback to Abyssinian ivory is a prevalence of a rather thick bark. Egyptian is liable to be cracked, from the extreme variations of temperature; more so formerly than now, since better methods of packing and transit are used. Ivory is extremely sensitive to sudden extremes of temperature; for this reason billiard balls should be kept where the temperature is fairly equable.

The market terms by which descriptions of ivory are distinguished are liable to mislead. They refer to ports of shipment rather than to places of origin. For instance, “Malta” ivory is a well-understood term, yet there are no ivory producing animals in that island.

Tusks should be regular and tapering in shape, not very curved or twisted, for economy in cutting; the cost fine, thin, clear and transparent. The substance of ivory is so elastic
and flexible that excellent riding-whips have been cut longitudinally from whole tusks. The size to which tusks grow and are brought to market depends on race rather than on size of elephants. The latter run largest in equatorial Africa. Asiatic bull elephant tusks seldom exceed 50 lb in weight, though lengths of 9 ft. and up to 150 lb weight are not entirely unknown. Record lengths for African tusks are the one presented to George V., when prince of Wales, on his marriage (1893), measuring 8 ft. 7½ in. and weighing 165 lb, and the pair of tusks which were brought to the Zanzibar market by natives in 1898, weighing together over 450 lb. One of the latter is now in the Natural History Museum at South Kensington; the other is in Messrs Rodgers & Co.'s collection at Sheffield. For length the longest known are those belonging to Messrs Rowland Ward, Piccadilly, which measure 11 ft. and 11 ft. 5 in. respectively, with a combined weight of 293 lb. Osteodentine, resulting from the effects of injuries from spearheads or bullets, is sometimes found in tusks. This formation, resembling stalactites, grows with the tusk, the bullets or iron remaining embedded without trace of their entry.

The most important commercial distinction of the qualities of ivory is that of the hard and soft varieties. The terms are difficult to define exactly. Generally speaking, hard or bright ivory is less susceptible to air or water than the softer kind. It is, as it were, glassy and transparent. Soft contains more moisture, stands differences of climate and temperature better, and does not crack so easily. The expert is guided by the shape of the tooth, by the colour and quality of the bark or skin, and by the transparency when cut, or even before, as at the point of the tooth. Roughly, a line might be drawn almost centrally down the map of Africa, on the west of which the hard quality prevails, on the east the soft. In choosing ivory for example for knife-handles—people rather like to see a pretty grain, strongly marked; but the finest quality in the hard variety, which is generally used for them, is the closest and freest from grain. The curved or canine teeth of the hippopotamus are valuable and come in considerable quantities to the European markets. Owen describes this variety as "an extremely dense, compact kind of dentine, partially defended on the outside by a thin layer of enamel as hard as porcelain; so hard as to strike fire with steel." By reason of this hardness it is not at all liked by the turner and ivory workers, and before being touched by them the enamel has to be removed by acid, or sometimes by heating it. The inner surface in texture is slightly curled, mottled or damasked. Hippo ivory was at one time largely used for artificial teeth, but now mostly for umbrella and stick-handles; whole (in their natural form) for fancy door-handles and the like. In the trade the term is not "riverhorse" but "seahorse teeth." Walrus ivory is less dense and coarser than hippo, but of fine quality—what there is of it, for the oval centre which has more the character of coarse bone unfortunately extends a long way up. At one time a large supply came to the market, but of late years there has been an increasing scarcity, the animals having been almost exterminated by the ruthless persecution to which they have been subjected in their principal haunts in the northern seas. It is little esteemed now, though our ancestors thought highly of it. Comparatively large tusks are to be found in medieval sculpture of the 11th and 12th centuries, and the grips of most oriental swords, ancient and modern, are made from it. The ivory from the single tusk or horn of the narwhal is not of much commercial value except as an ornament or curiosity. Some horns attain a length of 8 to 10 ft., 4 in. thick at the base. It is dense in substance and of a fair colour, but owing to the central cavity there is little of it fit for anything larger than napkin-rings.

**IVORY in Commerce and its Industrial Applications.—**Almost the whole of the importation of ivory to Europe was until recent years confined to London, the principal distributing mart of the world. But the opening up of the Congo trade has placed the port of Antwerp in a position which has equalled and, for a time, may surpass that of London. Other important markets are Liverpool and Hamburg; and Germany, France and Portugal have colonial possessions in Africa, from which it is imported. America is a considerable importer for its own requirements. From the German Cameroon alone, according to Schilling, there were exported during the ten years ending 1905, 4,550,100 kilos of ivory. Mr Buxton estimates the amount of ivory imported into the United Kingdom at about 500 tons. If we give the same to Antwerp we have from these two ports alone no less than 1000 tons a year to be provided. Allowing a weight so high as 30 lb per pair of tusks (which is far too high, perhaps twice too high) we should have here alone between thirty and forty thousand elephants to account for. It is true that every pair of tusks that comes to the market represents a dead elephant, but not necessarily by any means a slain or even a recently killed one, as is popularly supposed and unfortunately too often repeated. By far the greater proportion is the result of stores accumulated by natives, a good part coming from animals which have died a natural death. Not 20% is live ivory or recently killed; the remainder is known in the trade as dead ivory.

In 1827 the principal London ivory importers imported 3000 cwt. in 1850, 8000 cwt. The highest price up to 1855 was £55 per cwt. At the July sales in 1895 a record price was reached for billiard-ball teeth at £167 per cwt. The total imports into the United Kingdom were, according to Board of Trade returns, in 1890, 14,349 cwt.; in 1895, 10,911 cwt.; in 1900, 9889 cwt.; in 1904, 9045 cwt.

From Messrs Hale & Son's (ivory brokers, 10 Fenchurch Avenue) Ivory Report of the second quarterly sales in London, April 1906, it appears that the following were offered:

<tr>
<td>Walrus</td>
</tr>
<tr>
<td>Waste ivory</td>
</tr>
</tbody>
</table>

Hard ivory was scarce. West Coast African was principally of the Gambian description, and some of very fine quality. There was very little inquiry for walrus. The highest prices ranged as follows: Soft East Coast tusks (Zanzibar, Mozambique, Bombay and Siam), 102 to 143 lb, each £66, lots of 75, 100, per cwt. Billiard-ball scroffs, £104 per cwt. Cut points for billiard balls (3½ in. to 3½ in.) £114 to £151 per cwt. Seahorse (for best), 36. to 48. per lb. Boars' tusks, 6d. to 7d. per lb.

Quantities of ivory offered to Public auction (from Messrs Hale & Son's Reports).

In October 1889 soft East Indian fetched an average of £82 per cwt., but in several instances higher prices were realized, and one lot reached £88 per cwt. At the London April sales 1906 about 7½ tons
were offered from Gabun, Angola, and Cameroon (from the last 51 tons). To the port of Antwerp the imports were 6830 cwt. in 1904 and 6570 cwt. in 1905; of which 5310 cwt. and 4890 cwt. respectively were from the Congo State.

The leading London houses are held quarterly in Mincing Lane, a very interesting and wonderful display of tusks and ivory of all kinds being laid out previously for inspection in the great warehouses known as the "Ivory Floor" in the London docks. The quarterly Liverpool sales follow the London ones, with a smaller stock.

The important part which ivory plays in the industrial arts is not only for decorative, but also for domestic applications is hardly sufficiently recognized. Nothing is wasted of this valuable product. Hundreds of sacks full of cuttings and shavings, and scraps returned by manufacturers after they have used what they require for their particular trade, come to the mart. The dust is used for polishing, and in the preparation of Indian ink, and even for food in the form of ivory jelly. The scraps come in for laying and for the numberless purposes in which ivory is used for small domestic and decorative objects. India, which has been called the backbone of the trade, takes enormous quantities of the rings left in the turning of billiard-balls, which serve as women's bangles, or for making small toys and models, and in other characteristic Indian work. Without endeavouring to enumerate all the applications, a glance may be cast at the most important of those which consume the largest quantity. Chief among these is the manufacture of billiard-balls, of cutlery handles, of piano-keys and of brushware and toilet articles. Billiard-balls demand the highest quality of ivory; for the best balls the soft description is employed, though recently, through the competition of bonzoline and similar substitutes, the hard has been more used in order that the weight may be assimilated to that of the artificial kind. Therefore the most valuable tusks of all are those adapted for the billiard-ball trade. The term used is "scervelloes," and is applied to teeth proper for the purpose, weighing not over about 7 lb. The division of the tusk into smaller pieces for subsequent manufacture, in order to avoid waste, is a matter of importance.

The accompanying diagrams (figs. 1 and 2) show the method; the cuts are made radiating from an imaginary centre of the curve of the tusk. In after processes the various trades have their own particular methods for making the most of the material. In making a billiard-ball of the English size the first thing to be done is to rough out, from the cylindrical section, a sphere about 2 1/2 in. in diameter, which will eventually be 2 1/8 or sometimes less in size. A professional player has a little larger. One hemisphere—as shown in the diagrams—is first turned, and the resulting ring detached with a parting tool. The other hemisphere is accurately taken and the subsequent removals taken off in other directions. The ball is then fixed in a wooden chuck, the cylinder removed, and the half cylinder replaced. Any mistake, for bleaching with chemicals takes out the gdaine to some extent, alters the quality and affects the density; it also makes them more liable to crack, and they are not nearly so nice-looking. Billiard-balls should be bought in summer time when the temperature is most equable, and gently used till the winter season. On an average three balls of fine quality are got out of a tooth. The stock of more than one great manufacturer surpasses at times 30,000 in number.

IVORY

But although ball teeth rose in 1905 to £167 a cwt., the price of billiard-balls was the same in 1905 as it was in 1885. Roughly speaking, there are about twelve different qualities and prices of billiard-balls, and eight of pyramid-and pool-balls, the latter ranging from half a guinea to two guineas each.

The ivory for piano-keys is delivered to the trade in the shape of small, round knobs, as the purchaser, or, the formers for the parts which come under the fingers, the latter for that part coming up between the black keys. The two are joined afterwards on the keyboard with extreme accuracy. Piano-keys are bleached, but organists for some reason or other prefer unbleached keys.

The soft variety is mostly used for high-class work and preferably of the Egyptian type.

The great centres of the ivory industry for the ordinary objects of common domestic use are in England, for cutlery handles Sheffield, for billiard-balls and piano-keys London. For cutlery a large firm such as Rodgers & Sons uses an average of some twenty tons of ivory annually, mostly of the hard variety. But for billiard-balls and piano-keys America is now a large producer, and a considerable quantity is made France and Germany. Brush backs are almost wholly in English hands. Dieppe has long been famous for the numberless little ornaments and useful articles such as statuettes, crucifixes, little book-covers, paper-cutters, combs, serviette-rings and articles of Paris generally. And St. Claude in the Jura, and Geisingen in Württemberg, and Erbach in Hesse, Germany, are amongst the most important centres of the industry. India and China supply the multitude of toys, models, chess and draughtsmen, puzzles, workbox fittings and other curiosities.

Vegetable Ivory, &c.—Some allusion may be made to vegetable ivory and artificial substitutes. The plants yielding the vegetable ivory of commerce represent two or more species of an anomalous genus of palms, and are known to botanists as Phylocladus. They are natives of tropical South America, occurring chiefly on the banks of the river Magdalena, Colombia, always found in damp localities, not only, however, on the lower coast region as in Darien, but also at a considerable elevation above the sea. They are mostly found in dense forests or on the sides of mountains, where they are the extreme rank and most commonly known as the "tagua" by the Indians on the banks of the Magdalena, as the "anta" on the coast of Darien, and as the "pulli-punta" and "homeru" in Peru. It is stemless or short-stemmed, and crowns from twelve to twenty very long pinnate leaves. The plants are dioecious, the males forming higher, more erect and stronger trunks than the females. The male inflorescence is in the form of a simple fleshy cylindrical spadix covered with flowers; the female flowers are also in a single spadix, which, however, is shorter than in the male. The fruit consists of a conglomerated head composed of six or seven drupes, each containing from six to nine seeds, and the whole being enclosed in a walled woody covering forming a globe in shape, with a hard, often very heavy, and other animal. The seeds are nuts as they are usually called when fully ripe and hard, are used by the American Indians for making small ornamental articles and toys. They are imported into Britain in considerable quantities, frequently under the name of "Cocco" or "Corozo" nut. The nuts of a species of Attalea (another palm with hard ivory-like seeds) are known in Central America—their uses being chiefly for small articles of turnery. Of vegetable ivory Great Britain imported in 1904 1200 tons, of which about 400 tons were derived from the globe to Germany. It is mainly and largely used for coat buttons.

Many artificial compounds have, from time to time, been tried as substitutes for ivory; amongst them potatoes treated with sulphuric acid.
IVORY

difficult to find a dozen examples, from the age of Constantine onwards, other than sacred ones or of sacred symbolism. But as the period of the Renaissance approached, the influence of Romanic literature began to assert itself, and a feeling and style similar to those which are characteristic of the charming series of religious art in ivory, so touchingly conceived and executed, meet us in many objects in ivory destined for ordinary domestic uses and ornament. Mirror cases, caskets for jewelry or toilet purposes, combs, the decoration of arms, or of saddlery or of weapons of the chase, are carved and chased with scenes of real life or illustrations of the romances, which bring home to us in a vivid manner details of the manners and customs, amusements, dresses and domestic life of the times. With the Renaissance and a return to classical ideas, joined with a love of display and of gorgeous magnificence, art in ivory takes a secondary place.

There is a want of simplicity and of originality. It is the period of the commencement of decadence. Then comes the period nicknamed rococo, which persisted so long. Ivory carving follows the vulgar fashion, is content with copying or adapting, and until the revival in our own times, except in rare instances, no longer to be classed as a fine art. It becomes a trade and is in the hands of the mechanic of the workshop. In this necessarily brief and condensed sketch we have been concerned mainly with ivory carving in Europe. It will be necessary to give also, presently, some indications enabling the inquirer to follow the history—or at least to put him on the track of—it—not only in the different countries of the West but also in India, China and Japan.

Prehistoric Ivory Carvings.—These are the result of investigations made about the middle of the 19th century in the cave dwellings of the Dordogne in France and also of the lake dwellings of Switzerland. As records they are unique in the history of art. Further than this our wonderment is excited at finding these engravings or sculptures in the round, these chiselled examples of the art of the uncultivated savage, conceived and executed with a feeling of delicacy and restraint which the most modern artist might envy. Who they were who executed them must be left to the palaeontologist and geologist to decide. We can only be certain that they were contemporary with the period when the mammoth and the reindeer still roved freely in southern France. The most important examples are the sketch of the mammoth (see Painting, Plate I), on a slab of ivory now in the museum of the Jardin des Plantes, the head and shoulders of the ivory carved in the round on a piece of reindeer horn, and the figure of a woman (instances of representations of the human form are most rare) naked and wearing a necklace and bracelet. Many of the originals are in the museum at St Germain-en-Laye, and casts of a considerable number are in the British Museum.

Ancient Assyrian, Egyptian, Greek and Roman Ivories.—We know from ancient writers that the Egyptians were skilled in}

Fig. 3.—Panel with Cartouches, Nineveh.

acid. Celluloid is familiar to us nowadays. In the form of bonzoline, into which it is said to enter, it is used largely for billiard balls; and a new French substitute—a caseine made from milk, called gallalith—has begun to be much used for piano keys in the cheaper sorts of instrument. Odontolite is mammoth ivory, which through the lapse of time and from surroundings becomes converted into a substance known as fossil or blue ivory, and is used occasionally in jewelry as turquoise, which it very much resembles. It results from the tusks of antediluvian mammoths buried in the earth for thousands of years, during which time under certain conditions the ivory becomes slowly penetrated with the metallic salts which give it the peculiar vivid blue colour of turquoise.

Ivory Sculpture and the Decorative Arts.—The use of ivory as a material peculiarly adapted for sculpture and decoration has been universal in the history of civilization. The earliest examples which have come down to us take us back to prehistoric times, when, so far as our knowledge goes, civilization as we understand it had attained no higher degree than that of the dwellers in caves, or of the most primitive races. Throughout succeeding ages there is continued evidence that no other substance—except perhaps wood, of which we have even fewer ancient examples—has been so consistently connected with man's art-craftsmanship. It is hardly too much to say that to follow properly the history of ivory sculpture involves the study of the whole world's art in all ages. It will take us back to the most distant antiquity, to the mammoth ivory which adorned the capitals of Egypt and Assyria. Nor is there entire default, when we come to the periods of the highest civilization of Greece and Rome. It has held an honoured place in all ages for the adornment of the palaces of the great, not only in sculpture proper but in the rich inlay of panelling, of furniture, chariots and other costly articles. The Bible testifies with references to its beauty and value. And when, in the days of Pheidias, Greek sculpture had reached the highest perfection, we learn from ancient writers that colossal statues were constructed—notably the "Zeus of Olympia" and the "Athena of the Parthenon." The faces, hands and other exposed portions of these figures were of ivory, and the question, therefore, of the method of production of such extremely large slabs as perhaps were used has been often debated. A similar difficulty arises with regard to other pieces of considerable size, found, for example, amongst consular diptychs. It has been conjectured that some means of softening and moulding ivory was known to the ancients, but as a matter of fact though it may be softened it cannot be again of a consistent consistency. By the reign of Augustus the 4th century we are unable to point to a large number of examples of sculpture in ivory, from that date onwards the chain is unbroken, and during the five or six hundred years of unrest and strife from the decline of the Roman empire in the 4th century to the dawn of the Gothic revival of art in the 11th or 12th, ivory sculpture alone of the sculptural arts carries on the preservation of types and traditions of classic times in central Europe. Most important indeed is the rôle which existing examples of ivory carving play in the history of the last two centuries of the consulates of the Western and Eastern empires. Though the evidences of decadence in art may be marked, the close of that period brings us down to the end of the reign of Justinian (527-565). Two centuries later the iconoclastic persecutions in the Eastern empire drive westward and compel to settle there numerous colonies of monks and artificers. Throughout the Carolingian period, the examples of ivory sculpture which we possess in not inconsiderable quantity are of extreme importance in the history of the early development of the art of the ivory carver. And when the Western world of art arose from its torpor, freed itself from Byzantine shackles and traditions, and began to think for itself, it is to the sculptures in ivory of the Gothic art of the 13th and 14th centuries that we turn with admiration of their exquisite beauty of expression. Up to the 14th century the influence of the church was predominant in all matters relating to art. In ivories, as in mosaics, enamels or miniature painting it
forming the tapering points; and large quantities of small objects, including a box of plain form and simple decoration identified from the inscribed praenomen as the fifth dynasty, about 4000 B.C. The British Museum and the museum at Cairo are also comparatively rich. But no other collection in the world contains such an interesting collection of ancient Assyrian ivories as that in the British Museum. Those exhibited number some fifty important pieces, and many fragments are, on account of their fragility or state of decay, stowed away. The collection is the result of the excavations by Layard about 1840 on the supposed site of Nineveh opposite the modern city of Mosul. When found they were so decomposed from the lapse of time as scarcely to bear touching or the contact of the external air. Layard hit upon the ingenious plan of boiling in a solution of gelatine and thus restoring to them the animal matter which had dried up in the course of centuries. Later, the explorations of Flinders Petrie and others at Abydos brought to light a considerable number of sculptured fragments which may be even two thousand years older than those of Nineveh. They have been exhibited in London and since distributed amongst various museums at home and abroad.

Consular and Official and Private Diptychs.—About fifty of the remarkable plaques called "consular diptychs," of the time of the last three centuries of the consulates of the Roman and Greek empire have been preserved. They range in date from pershaps mid-fourth to mid-sixth centuries, and as with two or three exceptions the dates are certain it would be difficult to overestimate their historic or artistic value. The earliest of absolutely certain date is that of the diptych of Aosta (A.D. 408), the first after the recognition of Christianity; or, if the Monza diptych represents, as some think, the Consul Stilicon, then we may refer back six years earlier. At any rate the edict of Theodosius in A.D. 384, concerning the restriction of the use of ivory to the diptychs of the regular consuls, is evidence that the custom must have been long established. According to some authorities the beautiful leaf of diptych in the Liverpool Museum (fig. 4) is a consular one and to be ascribed to Marcus Julius Philippus (A.D. 248). Similarly the Gherardesca leaf in the British Museum may be accepted as of the Consul Marcus Aurelius (A.D. 308). But the whole question of the half dozen earliest examples is conjectural. With a few notable exceptions they show decadence in art. Amongst the finest may be cited the leaf with the combats with stags at Liverpool, the dip-tych of Probianus at Berlin and the two leaves, one of Anastasius, the other of Orestes, in the Victoria and Albert Museum.

The literature concerning these diptychs is voluminous, from the time of the erudite treatise by Gori published in 1759 to the present day. The latest of certain date is that of Basilius, consul of the East in 541, the last of the consuls. The diptychs of private individuals or of officials number about sixteen, and in the case of the private ones have a far greater artistic value. Of these the Victoria and Albert Museum possesses the most beautiful leaf of perhaps the finest example of ancient ivory sculpture which has come down to us, diptych Meleretense, representing a Bacchante (fig. 5). The other half, which is much injured, is in the Cluny Museum. Other important pieces are the Aeschylus and Hygeia at Liverpool, the Hippolytus and Phaedra at Brescia, the Barberini in the Bargello and at Vienna and the Ruiius Probianus at Berlin. Besides the diptychs ancient Greek and Roman ivories before the recognition of Christianity are comparatively small in number and are mostly in the great museums of the Vatican, Naples, the British Museum, the Louvre and the Cluny Museum. Amongst them are the statuette of Penthes, perhaps of the 3rd century (Cluny), a large head of a woman (museum of Vienna) and the Bellerophon (British Museum), nor must those of the Roman occupation in England and other countries be forgotten. Notable instances are the plaque and ivory mask found at Caereleon. Others are now in the Guildhall and British Museums, and most continental European museums have examples connected with their own history.

Early Christian and Early Byzantine Ivories.—The few examples we possess of Christian ivories previous to the time of Constantine are not of great importance from the point of view of the history of art. But after that date the ivories which we may ascribe to the centuries from the end of the 4th to at least the end of the 10th become of considerable interest, on account of their connexion with the development of Byzantine art in western Europe. With regard to exact origins and dates opinions are largely divergent. In great part they are due to the carrying on of traditions and styles by which the makers of the sarcophagi were inspired, and the difficulties of ascription are increased when in addition to the primitive elements the influence of Byzantine systems introduced many new ideas derived from many extraneous sources. The questions involved are of no small archaeological, iconographical and artistic importance, but it must be admitted that we are reduced to conjecture in many cases, and compelled to theorize. And it would seem to be impossible to be more precise as to dates than within a margin of sometimes three centuries. Then, again, we are met by the question how far these ivories are connected with Byzantine art; whether they were made in the West by immigrant Greeks, or indigenous works, or purely imported productions. Some German critics have endeavoured to construct a system of schools, and to form definite groups, assigning them to Rome, Ravenna, Milan and Monza. Not only so, but they claim to be precise in dating even to a certain decade of a century. But it is certainly more than doubtful whether there is sufficient evidence on which to found such assumptions. It is at least probable that a considerable number of the ivories whose dates are given by such a number of critics so wide a range as from the 4th to the 10th century are nothing more than the work of the monks of the numerous monasteries founded throughout the Carolingian empire, copying and adapting from whatever
came into their hands. Many of them were Greek immigrants exiled at the time of the iconoclastic persecutions. To these must be added the Celtic and Anglo-Saxon missionaries, who brought with them and disseminated their own national feeling and technique. We have to take into account also the relations which existed not only with Constantinople but also with the great governing provinces of Syria and Egypt. Where all our information is so vague, and in the face of so much conflicting opinion amongst authorities, it is not unreasonable to hold with regard to very many of these ivories that instead of assigning them to the age of Justinian or even the preceding century we ought rather to postpone their dating from one to perhaps three centuries later and to admit that we cannot be precise even within these limits. It would be impossible to follow here the whole of the arguments relating to this most important period of the development of ivory sculpture or to mention a title of the examples which illustrate it. Amongst the most striking the earliest is the very celebrated leaf of a diptych in the British Museum representing an archangel (fig. 6). It is generally admitted that we have no ivory of the 5th or 6th centuries or in fact of any early medieval period which can compare with it in excellence of design and workmanship. There is no record (it is believed) from whence the museum obtained the ivory. There are at least plausible grounds for surmising that it is identical with the "Angelus longus eburneus" of a book-cover among the books brought to England by St Augustine which is mentioned in a list of things belonging to Christchurch, Canterbury (see Dart, App. p. xviii.). The dating of the four Passion plaques, also in the British Museum, varies from the 5th to the 7th century. But although most recent authorities accept the earlier date, the present writer holds strongly that they are not anterior to the earliest, the 7th century. Even then they will remain, with the exception of the Monza oil flask and perhaps the St Sabina doors, the earliest known representation of the crucifixion. The ivory vase, with cover, in the British Museum, appears to possess defined elements of the farther East, due perhaps to the relations between Syria and Christian India or Ceylon. Other important early Christian ivories are the series of pyxes, the diptych in the treasury of St Ambrogio at Milan, the chair of Maximian at Ravenna (most important as a type piece), the panel with the "Ascension" in the Bavarian National Museum, the Brescia casket, the "Lorsch" bookcovers of the Vatican and Victoria and Albert Museum, the Bodleian and other bookcovers, the St Paul diptych in the Bargello at Florence and the "Annunciation" plaque in the Trivulzio collection. So far as unquestionably oriental specimens of Byzantine art are concerned they are few in number, but we have in the famous Harbaville triptych in the Louvre a super-excellent example.

Gothic Ivories. — The most generally charming period of ivory sculpture is unquestionably that which, coincident with the Gothic revival in art, marked the beginning of a great and lasting change. The formalism imposed by Byzantine traditions gave place to a brighter, more delicate and tenderer conception.

This golden age of the ivory carver—at its best in the 13th century—was still in evidence during the 14th, and although there is the beginning of a transition in style in the 15th century, the period of neglect and decadence which set in about the beginning of the 16th hardly reached the acute stage until well on into the 17th. To review the various developments both of religious art which reigned almost alone until the 14th century, or of the secular side as exemplified in the delightful mirror cases and caskets carved with subjects from the romantic stories which were so popular, would be impossible here. Almost every great museum and famous private collection abounds in examples of the well-known diptychs and triptychs and little portable oratories of this period. Some, as in a famous panel in the British Museum, are marvels of minute workmanship, others of delicate openwork and tracery. Others, again, are remarkable for the wonderful way in which, in the compass of a few inches, whole histories and episodes of the scriptural narratives are expressed in the most vivid and telling manner. Charming above all are the statuettes of the Virgin and Child which French and Flemish art, especially, have handed down to us. Of these the Victoria and Albert Museum possesses a representative collec-

![Fig. 6.—Leaf of Diptych, representing Archangel; in the British Museum.](image)

![Fig. 7.—Mirror Case, illustrating the Storming of the Castle of Love; in the Victoria and Albert Museum.](image)
unique harp now in the Louvre. The above enumeration will alone suffice to show that the inquirer must be referred for details to the numerous works which treat of medieval ivory sculpture.

Ivory Sculpture from the 18th to the 19th Century.—Compared with the wealth of ivory carving of the two preceding centuries, the 18th, and especially the 19th, centuries are singularly poor in really fine work. But before we arrive at the period of real decadence we shall come across such things as the knife of Diana of Poitiers in the Louvre, the sceptre of Louis XIII., the Rothschild hunting horn, many Italian powder horns, the German Psyche in the Louvre, or the “Young Girl and Death” in the Munich Museum, in which there is undoubtedly originality and talent of the first order. The practice of ivory carving became extremely popular throughout the 17th and 18th centuries, especially in the Netherlands and in Germany, and the amount of ivory consumed must have been very great. But, with rare exceptions, and these for the most part Flemish, it is art of an inferior kind, which seems to have been abandoned to second-rate sculptors and the artisans of the workshop. There is little originality, the rococo styles run riot, and we seem to beconfined to the leavings of the best drawing schools, gods and goddesses, bacchanalians and satyrs, pseudo-classical copies from the antique and imitations of the schools of Rubens. As a matter of fact few great museums, except the German ones, care to include in their collections examples of these periods. Some exceptions are made in the case of Flemish sculptors of such talent as François Duquesnoy (Fiammingo), Gerard van Obstal or Lucas Fayd’hérée. In a lesser degree, in Germany, Christoph Angermair, Leonhard Kern, Bernhard Straus. Elhain, Kruger and Rauchmiller; and, in France, Jean Guillermin, David le Marchand and Jean Cavalier. Crucifixes were turned out in enormous numbers, some of not considerable merit, but, for the most part, they represent anatomical exercises varying but slightly from a pattern of which a celebrated one attributed to Faistenberger may be taken as a type. Tankards abound, and some, notably the one in the Jones collection, on which perhaps no finer example exists, are also of a high standard. Duquesnoy’s work is well illustrated by the charming series of six plaques in the Victoria and Albert Museum known as the “Francois Duquesnoy...” Amongst the immemorial series of gods and goddesses, ivories, netsukes, and others, of all descriptions of the early 18th century, the many examples of the curious implements known as rapoires, or tobacco graters, should be noticed. It may perhaps be necessary to add that although the character of art in ivory in these periods is not of the highest, the subject is not entirely unworthy of attention and study, and there are a certain number of remarkable and even admirable examples.

Ivory Sculpture of Spain, Portugal, India, China and Japan.—

Generally speaking, with regard to Spain and Portugal, there is little reason to do otherwise than to confine our attention to a certain class of important Moorish or Hispano-Moresque ivories of the time of the Arab occupation of the Peninsula, from the 8th to the 15th centuries. Some fine examples are in the Victoria and Albert Museum. Portuguese work of this period is little except the hybrid productions of Goa and the Portuguese settlements in the East. Some mention must be made also of the remarkable examples of mixed Portuguese and savage art from Benin, now in the British Museum. Of Indian ivory carvings, the India Museum at Kensington supplies a very large and varied collection which has no equal elsewhere. But there is little older than the 17th century, nor can it be said that Indian art in ivory can occupy a very high place in the history of the art. What we know of Chinese carving in ivory is confined to those examples which are turned out for the European market, and can hardly be considered as appealing very strongly to cultivated tastes. A brief reference to the well-known delightful netsukés and the characteristic inlaid work must suffice here for the ivories of Japan (see JAPAN: Art).

Ivory Sculpture in the 19th Century and of the Present Day.—

Few people are aware of the extent to which modern ivory sculpture is practised by distinguished artists. Year by year, however, a certain amount is exhibited in the Royal Academy and in most European salons, but in England the works—necessarily not very fine—are soon absorbed in private collections. On the European continent, on the contrary, in such galleries as the Belgian state collections or the Luxembourg, examples are frequently acquired and exhibited. In Belgium the acquisition of the Congo and the considerable import of ivory thence gave encouragement to a definite revival of the art. Important exhibitions have been held in Belgium, and a notable one in Paris in 1904. Though ivory carving is as expensive as marble sculpture, all sculptors delight in following it, and the material entails no special knowledge or training. Of 19th-century artists there were in France amongst the best known, besides numerous minor workers of Dieppe and St. Claude, Augustin Moreau, Vautier, Soitoux, Belleteste, Meugniot, Pradier, Triqueti and Gerôme; and in the first decade of the 20th century, besides such distinguished names as the first rank as Jean Dampt and Théodore Rivièrc, there were Vever, Gardet, Caron, Barrias, Allouard, Ferrary and many others. Now must the decorative work of René Lalique be omitted. No less than forty Belgian sculptors exhibited work in ivory at the Brussels exhibition of 1910; amongst them were Constant Mennier, van der Steppen, Khnopp, P. Wolters, Samuel and Paul de Vigne, and amongst contemporary Belgian sculptors are also van Beurden, G. Devreeze, Vincotte, de Tombay and Lagaë. In England the most notable work includes the “Lamia” of George Frampton, the “St Elizabeth” of Alfred Gilbert, the “Mors Janua Vitae” of Harry Bates, the “Lancelet” of W. Reynolds-Stephens and the use of ivory in the applied arts by Lynn Jenkins, A. G. Walker, Alexander Fisher and others.

AUTHORITIES.—See generally A. Maskell, IVORIES (1906), and the bibliography there given.

On Early Christian and Early Byzantine ivories, the following works may be mentioned: Abbe Cahrol, Dictionnaire de l’archéologie chrétienne (in progress); O. M. Dalton, Catalogue of Early Christian Antiquities in British Museum (1902); E. Dobbert, Zur Geschichte der Elfenbeinsculptur (1885); H. Graeven, Antike Schmuckereien (1903); R. Kander, Gli avori, L’Art Byzantin; A. Maskell, Canor Lectures, Soc. of Arts (1906) (lecture II., “Early Christian and Early Byzantine Ivories”); Strzygowski, Byzantinische Denkmaler (1891); V. Schultze, Archæologie de l’alchimizien Kunst (1895); G. Stuhlfauth, Die alchimizien Elfenbeinplastik (1896).

IVORY COAST (Côte d’Ivoire), a French West African colony, bounded on the Gulf of Guinea, W. by Liberia and French Guinea, N. by S project to Upper Nile and Niger, E. by the Atlantic Ocean. Its area is approximately 72,000 square miles, and its population possibly 2,000,000, of whom some 600 are Europeans. Official estimates (1898) placed the native population as low as 980,000.

Physical Features.—The coast-line extends from 6° 30’ to 12° 30’ W. and has a length of 380 miles. It forms an arc of a circle of which the convexity turns slightly to the north: neither bay nor promontory breaks the regularity of its outline. The shore is low, bordered in its
eastern half with lagoons, and difficult of access on account of the submarine bar of sand which stretches along nearly the whole of the coast, and also because of the heavy surf caused by the great Atlantic billows. The principal lagoons, going W. to E., are those of Grand Bassam, Bassam, and La Libreville. Bassam has a thickness of 11 ft., and is 3 m. inland about 40 m. Beyond the ground rises in steep slopes to a general level of over 1000 ft., the plateau being traversed in several directions by hills rising 2000 ft. and over, and cut by valleys with a general fall of 1000 ft. In the interior, Liegnet's (see Bassam G., q.v.), the country becomes mountainous, Mt. Komombo attaining a height of 4757 ft. In the north-west, by the Liberian frontier, the mountains in the Gneiss region rise over 6000 ft. Starting from the coast, there are the Chokwe, the Chokwe Plateau, the Bafwa (Kavali), the San Pedro, the Sassandara (240 m. long), the Bandama (225 m.), formed by the White and the Red Bandama, the Komoe (360 m.) and the Bia. All these streams are interrupted by rapids as they descend from the highlands to the plains and are unnavigable by small vessels except in the rainy season. The rivers have all drained to the Gulf of Guinea; the rivers in the extreme north of the colony belong to the Niger system, being affluents of the Danu or Mahal Bafeed branch of that river. These rivers are about half a mile wide, and are marked by a line of hills rising about 650 ft. above the level of the plateau. The climate is in general very hot and unhealthy, the rainfall being very heavy. In some parts of the plateau healthier conditions prevail. Bassam and the towns are about 15 m. from the sea. Primeval forest extends from the coast plains to about 8° N., covering nearly 50,000 sq. m.

Inhabitants.—The coast districts are inhabited by Negro tribes allied on the one hand to the Krunen (p.v.) and on the other to the people of Ashanti (p.v.). The Ashantis are of Ashanti origin, and chiefly of the Ochin and Agni tribes. Farther west are found the "Jack-Jacks" and the "Kwa-Kwa," sobriquets given respectively to the Aradian and Avikom by the early traders. The Kwa-Kwa are said to be so called because their salutation resembles the cry of a cock. In the interior the Negro tribes are divided among the Bambara, with an admixture of Elfenhier and other blood. The tribes represented include Jamans, Wongaras and Mandingos (q.v.), some of whom are Moslems. The Mandingos have intermarried largely with the Bambara or Sienfu, an agricultural people of more than average intelligence widely spread over the country, of which they are considered to be the indigenous race. The Baulé, who occupy the central part of the colony, are of Agni-Ashanti origin. The bulk of the inhabitants are fetish worshippers. On the northern confines of the great forest belt live races of cannibals, whose existence was first made known by Captain d'Ollone in 1809. In general the coast tribes are peaceful. They have the reputation of being neither industrious nor intelligent. The traders are chiefly Fanti, Sierra Leonians, Senegalese and Mandingos.

Towns.—The chief towns on the coast are Grand Bassam, Jackville and Assini on the east and Grand Lohu, Sassandara and Taboua on the west. Bassam is, and indeed was, a port of immense importance, and still retains its position as one of the great centres of trade of the coast. The river Bassam, which enters the sea on the west side of the town, has a fall of 12 ft. at the point where it leaves the coast, and the town is served by a light railway.

The towns, with the exception of Grand Bassam, are situated on the coast, the exception being Grand Lohu, which is a small seaport about 25 m. due south of Bassam, and about 25 m. due north of Taboua. The town is built on a hill, and is mostly inhabited by Europeans. Bassam is a town of about 2000 inhabitants, consisting chiefly of Negroes and Europeans. The town is situated on the coast, and is about 15 m. from the sea, and is the chief town of the colony. It is about 8° N., covering nearly 50,000 sq. m.
The king had, however, previously concluded treaties of “commerce and friendship” with the French, and by the Anglo-French agreement of August 1880 Jaman, with Bonotuku, was recognized as French territory. In 1892 Captain Binger made further explorations in the interior of the Ivory Coast, and in 1893 he was appointed the first governor of the colony on its erection into an administration distinct from that of Senegal. Among other famous explorers who helped to make known the hinterland was Colonel (then Captain) Marchand. It was to the zone between the Kong states and the hinterland of Liberia that Samory (see SENEGAL) fled for refuge before he was taken prisoner (1868), and for a short time he was master of Kong. The boundary of the colony on the west was settled by Franco-Liberian agreements of 1892 and subsequent dates; that on the east by the Anglo-French agreements of 1893 and 1898.

The northern boundary was fixed in 1890 on the division of the middle Niger territories (up to that date officially called the French Sudan) among the other French West African colonies. The systematic development of the colony, the opening up of the hinterland, and the exploitation of its economic resources date from the appointment of Captain Binger as governor, a post he held for over three years. The work he began has been carried on zealously and effectively by subsequent governors, who have succeeded in winning the co-operation of the natives.

In the older books of travel are often found the alternative names for this region, Tooth Coast (Côte des Dents) or Kwa-Kwa Coast, and, less frequently, the Coast of the Five and Six Stripes (alluding to a kind of cotton fabric in favour with the natives).

The term Côte des Dents continued in general use in France until the closing years of the 19th century.

See **Dits ans à la Côte d'Ivoire (Paris, 1906)** by F. J. Clozel, governor of the colony, and **Notre colonie la Côte d'Ivoire (Paris, 1903)** by R. Villamur and Richard. These two volumes deal with the history, geography, zoology and economic condition of the Ivory Coast. **La Côte d'Ivoire** by Michellet and Clement describes the administrative and land systems, &c. Another volume also called **La Côte d'Ivoire (Paris, 1908)** is an official monograph on the colony. For ethnographers consult **Costumes indigènes de la Côte d'Ivoire (Paris, 1902)** by F. J. Clozel and R. Villamur, and **Les Costumes Africains**, by R. Villamur and Delafosse. Of books of travel see **Du Niger au Golfe de Guinée par Kong (Paris, 1892)** by L. G. Binger, and **Mission Hostaines-d'Ollo (Paris, 1901)** by Captain d'Ollinck. **A Côte de la Côte d'Ivoire** by A. Meunier, on the scale of 1:500,000 (6 sheets), was published in Paris, 1905. Annual reports on the colony are published by the French colonial and the British foreign offices.

**IVREA (anc. Ecoredia),** a town and episcopal see of Piedmont, Italy, in the province of Turin, from which it is 38 m. N.N.E. by rail and 27 m. direct, situated 770 ft. above sea-level, on the Dora Baltea at the point where it leaves the mountains. Pop. (1901) 6047 (town), 11,696 (commune). The cathedral was built between 973 and 1005; the gallery round the back of the apse and the crypt have plain cubic capitals of this period. The two campaniles flanking the apse at each end of the side aisle are the oldest example of this architectural arrangement. The isolated tower, which is all that remains of the ancient abbey of S. Stefano, is slightly later. The hill above the town is crowned by the imposing Castle delle Quattro Torri, built in 1358, and now a prison. One of the four towers was destroyed by lightning in 1676. A tramway runs to Santhià.

The ancient Ecoredia, standing at the junction of the roads from Augusta Taurinorum and Vercellae, at the point where the road to Augusta Praetoria enters the narrow valley of the Duria (Dora Baltea), was a military position of considerable importance belonging to the Salassi who inhabited the whole upper valley of the Duria. The importance of the gold-mines of the district led to its seizure by the Romans in 143 B.C. The centre of the mining industry seems to have been Victorumlne (see Ticium), until in 100 B.C. a colony of Roman citizens was founded at Ecoredia itself; but the prosperity of this was only ascertained when the Salassi were finally defeated by Marcus Aurelius and Augusta Praetoria founded. There are remains of a theatre of the time of the Antonines and the Ponte Vecchio rests on Roman foundations.

In the middle ages Ivrea was the capital of a Lombard duchy,
with pinnate leaves. It is a native of Queensland, and is practically unknown in cultivation.

It is of the utmost importance to note the difference of characters of the same species of ivy in its two conditions of climbing and fruiting. The first stage of growth, which we will suppose to be from the seed, is essentially scendent, and the leaves are lobed more or less. This stage is accompanied with a plentiful production of the claspers or modified roots by means of which the plant becomes attached and obtains support. When it has reached the summit of the tree or tower, the stems, being no longer able to maintain a perpendicular attitude, fall over and become horizontal or pendent. Coincidently with this change they cease to produce claspers, and the leaves are strikingly modified in form, being now narrower and less lobed than on the ascending stems. In due time this tree-like growth produces terminal umbels of greenish flowers, which have the parts in fives, with the styles united into a very short one. These flowers are succeeded by smooth black or yellow berries, containing two to five seeds. The yellow-berried ivy is met with in northern India and in Italy, but in northern Europe it is known only as a curiosity of the garden, where, if sufficiently sheltered and nourished, it becomes an exceedingly beautiful and fruitful tree.

It is stated in books that some forms of sylvestral ivy never flower, but a negative declaration of this kind is valueless. Sylvestral ivies of great age may be found in woods on the western coasts of Britain that have apparently never flowered, but this is probably to be explained by their inability to surmount the trees supporting them, for until the plant can spread its branches horizontally in full daylight, the flowering or tree-like growth is never formed.

A question of great practical importance arises out of the relation of the plant to its means of support. A moderate growth of ivy is not injurious to trees; still the tendency is from the first inimical to the prosperity of the tree, and at a certain stage it becomes deadly. Therefore the growth of ivy on trees should be kept within reasonable bounds, more especially in the case of trees that are of special value for their beauty, history, or the quality of their timber. In regard to buildings clothed with ivy, there is nothing to be feared so long as the plant does not penetrate the substance of the wall by means of fissure. Should it thrust its way in, the natural and continuous expansion of its several parts will necessarily hasten the decay of the edifice. But a fair growth of ivy on sound walls that afford no entrance beyond the superficial attachment of the claspers is, without any exception whatever, beneficial. It promotes dryness and warmth, reduces to a minimum the corrosive action of the atmosphere, and is altogether as conservative as it is beautiful.

The economical uses of the ivy are not of great importance. The leaves are eaten greedily by horses, deer, cattle and sheep, and in times of scarcity have proved useful. The flowers afford a good supply of honey to bees; and, as they appear in autumn, they occasionally make amends for the shortcomings of the season. The berries are eaten by wood pigeons, blackbirds and thrushes. From all parts of the plant a balsamic bitter may be obtained, and this in the form of hederic acid is the only preparation of ivy known to chemists.

In the garden the uses of the ivy are innumerable, and the least known though not the least valuable of them is the cultivation of the plant as a bush or tree. The fruiting growth being selected for this purpose. The variegated tree forms of *H. Helix*, with leaves of creamy white, golden green or rich deep orange yellow, soon prove handsome miniature trees, that thrive almost as well in smoky town gardens as in the pure air of the country. The ivy is sort of an American and that to the least. The tree-form of the Asiatic ivy (*H. colchico*) is scarcely to be equalled in beauty of leafage by any evergreen shrub known to English gardens, and, although in the course of a few years it will attain to a stature of 5 or 6 ft., it is but rarely we meet with it, or indeed with tree ivies of any kind, but little attention having been given to this subject until recent years. The scendent forms are more generally appreciated, and are now much employed in the formation of marginal lines, screens and trained pyramids, as well as for clothing walls. A very striking example of the capabilities of the commonest ivies, when treated artistically as garden plants, may be seen in the Zoological Gardens of Amsterdam, where several paddocks are enclosed with wreaths, garlands and bands of ivy in a most picturesque manner.

About sixty varieties known in gardens are figured and described in *The Ivy, a Monograph*, by Shirley Hibberd (1872). To cultivate these is an extremely simple matter, as they will thrive in a poor soil and endure a considerable depth of shade, so that they may with advantage be planted under trees. The common Irish ivy is often to be seen clothing the ground beneath large yew trees where grass would not live, and it is occasionally planted in graveyards in London to form an imitation of grass turf, for which purpose it is admirably suited.

The ivy, like the holly, is a scarce plant on the American continent. In the northern United States and British America the winters are not more severe than the ivy can endure, but the summers are too hot and dry, and the requirements of the plant have not often obtained attention. In districts where native ferns abound the ivy will be found to thrive, and the varieties of *Hedera Helix* should have the preference. But in the drier districts ivies might often be planted on the north side of buildings, and, if encouraged with water and careful training for three or four years, would then grow rapidly and train themselves. A strong light is detrimental to the growth of ivy, but this enhances its value, for we have no hardy plants that may be compared with it for variety and beauty that will endure shade with equal patience.

The North American poison ivy (poison oak), *Rhus Toxicodendron* (nat. order Anacardiaceae), is a climber with pinnately compound leaves, which are very attractive in their autumn colour but poisonous to the touch to some persons, while others can handle the plant without injury. The effects are redness and violent itching followed by fever and a vesicular eruption.

The ground ivy, *Neopeta Glycinea* (nat. order Labiatae), is a small creeping plant with rounded crenate leaves and small blue-purple flowers, occurring in hedges and thickets.

**IWAKURA, TOMOMI**, Prince (1835-1885), Japanese statesman, was born in Kiotō. He was one of the court nobles (kuge) of Japan, and he traced his descent to the emperor Murakami (A.D. 947-967). A man of profound ability and singular force of character, he acted a leading part in the complications preceding the fall of the Tokugawa shōgunate, and was obliged to fly from Kiotō accompanied by his acojutor, Prince Sanjo. They took refuge with the Daimyō of Chōshū, and, while there, established relations which contributed greatly to the ultimate union of the two great fiels, Satsuma and Chōshū, for the work of the Restoration. From 1867 until the day of his death Iwakura was one of the most prominent figures on the political stage. In 1871 he proceeded to America and Europe at the head of an imposing embassy of some fifty persons, the object being to explain to foreign governments the actual conditions existing in Japan, and to pave the way for negotiating new treaties consistent with her sovereign rights. Little success attended the mission. Returning to Japan in 1873, Iwakura found the cabinet divided as to the manner of dealing with Korea's insulting attitude. He advocated peace, and his influence carried the day, thus avoiding a difficulty which, though apparently of minor dimensions, might have changed the whole course of Japan's modern history.
IXION, in Greek legend, son of Phlegyas, king of the Lapithae in Thessaly (or of Ares), and husband of Dia. According to custom he promised his father-in-law, Deioneus, a handsome bridal present, but treacherously murdered him when he claimed the fulfilment of the promise. As a punishment, Ixion was seized with madness, until Zeus purified him of his crime and admitted him as a guest to Olympus. Ixion abused his pardon by trying to seduce Hera, but the goddess substituted for herself a cloud, by which he became the father of the Centaurs. Zeus bound him on a fiery wheel, which rolls unceasingly through the air or (according to the later version) in the underworld (Pindar, *Pythia*, ii. 21; Ovid, *Metam.* iv. 461; Virgil, *Aeneid*, vi. 601). Ixion is generally taken to represent the eternally moving sun. Another explanation connects the story with the practice (among certain peoples of central Europe) of carrying a blazing, revolving wheel through fields which needed the heat of the sun, the legend being invented to explain the custom and subsequently adopted by the Greeks (see Mannhardt, *Wald- und Feldkultur*, ii. 1905, p. 83). In view of the fact that the oak was the sun-god's tree and that the mistletoe grew upon it, it is suggested by A. B. Cook (Class. Rev. xvii. 420) that *Ιξίως* is derived from *Ιξία* (mistletoe), the sun's fire being regarded as an emanation from the mistletoe. Ixion himself is probably a by-form of Zeus (Usener in *Rhein. Mus.* liii. 345).

"The Myth of Ixion" (by C. Smith, in *Classical Review*, June 1895) deals with the subject of a red-figure canthus in the British Museum.

IXTACIHuatl, or Ixtacihuatl ("white woman"), a lofty mountain of volcanic origin, 10 m. of Popocatepetl and about 40 m. S.S.E. of the city of Mexico, forming part of the short spur called the Sierra Nevada. According to Angelo Heilprin (1863-1907) its elevation is 16,960 ft.; other authorities make it much less. Its apparent height is dwarfed somewhat by its elongated summit and the large area covered. It has three summits of different heights standing on a north and south line, the central one being the largest and highest and all three rising above the permanent snow-line. As seen from the city of Mexico the three summits have the appearance of a shrouded human figure, hence the poetic Aztec appellation of "white woman" and the unsentimental Spanish designation "La mujer gorda." The ascent is difficult and perilous, and is rarely accomplished.

Heilprin says that the mountain is largely composed of trachytic rocks and that it is older than Popocatepetl. It has no crater and no trace of lingering volcanic heat. It is surmised that its crater, if ever had one, has been filled in and its cone worn away by erosion through long periods of time.

TyRCAE, an ancient nation on the north-east trade route described by Herodotus (iv. 22) beyond the Thysagetae, somewhere about the upper basins of the Tobol and the Irtyshev. They were distinguished by their mode of hunting, climbing a tree to survey their game, and then pursuing it with trained horses and dogs. They were almost certainly the ancestors of the modern Magyars, also called Jugra.

The reading *Tigsoi* is an anachronism, and when Pliny (*N.H.* vi. 19) and Mela (i. 116) speak of Tyrcae it is also probably due to a false correction. (E. H. M.)

IZBARTA, or *Sparta* [anc. *Baris*], the chief town of the Hamid-abad sanjak of the Konia vilayet, in Asia Minor, well situated on the edge of a fertile plain at the foot of Aghalasun Dagh. It was once the capital of the Emirate of Hamid. It suffered severely from the earthquake of the 16th-17th of January 1882. It is a prosperous place with an enlightened Greek element in its population (hence the numerous families called "Spartali" in Levantine towns); and it is, in fact, the chief inland colony of Hellenism in Anatolia. Pop. 20,000 (*Moslems* 13,000, *Christians* 7000). The new Aident railway extends from Dineir to Izbita via Buldur.

IZHEVSK, a town of Russia, in the government of Vyatka, 140 m. S.W. of Perm and 22 m. W. from the Kama, on the Izh river. Pop. (1897) 21,500. It has one of the principal steel and rifle works of the Russian crown, started in 1887. The making of sporting guns is an active industry.

IZMAIL, or ISMAIL, a town of Russia, in the government of Bessarabia, on the left bank of the Kilia branch of the Danube, 35 m. below Reni railway station. Pop. (1866) 31,779, (1900) 33,607, comprising Great and Little Russians, Bulgarians, Jews and Gipsies. There are flour-mills and a trade in cereals, wool, tallow and hides. Originally a Turkish fortified post, Izmail had by the end of the 18th century grown into a place of 30,000 inhabitants. It was occupied by the Russians in 1779, and twenty years later its capture was one of the brilliant achievements of the Russian general, Count A. V. Suvarov. On that occasion the garrison was 40,000 strong, and the assault cost the assailants 10,000 and the defenders 30,000 men. The victory was the theme of one of the Russian poet G. R. Derzhavin's odes. In 1809 the town was again captured by the Russians; and, when in 1812 it was assigned to them by the Bucharest peace, they chose it as the central station for their Danube fleet. It was about this time that the town of Tuchkov, with which it was later (1830) incorporated, grew up outside of the fortifications. These were dismantled in accordance with the treaty of Paris (1856), by which Izmail was made over to Rumania. The town was again transferred to Russia by the peace of Berin (1878).

IZU-NO-SHICHI-TŌ, the seven (shichi) islands (to) of Izu, included in the empire of Japan. They stretch in a southerly direction from a point near the mouth of Tokyo Bay, and lie between 33° and 34° 48' N. and between 139° and 140° E. Their names, beginning from the north, are Izu-no-Oshima, To-shima, Nii-shima, Kozu-shima, Miyake-shima and Hachijo-shima. There are some islets in their immediate vicinity. Izu-no-Oshima, an island 10 m. long and 3½ m. wide, is 15 m. from the nearest point of the Izu promontory. It is known to western cartographers as Vries Island, a name derived from that of Captain Martin Gerritsz de Vries, a Dutch navigator, who is supposed to have discovered the island in 1643. But the group was known to the Japanese from a remote period, and used as convict settlements certainly from the 12th century and probably from a still earlier era. Hachijo, the most southerly, is often erroneously written "Fatsisio" on English charts. Izu-no-Oshima is remarkable for its smoking volcano, Mihara-yama (2461 ft.), a conspicuous object to all ships bound for Yokohama. Three others of the islands—Nii-shima, Kozu-shima and Miyake-shima—have active volcanoes. Those on Nii-shima and Kozu-shima are of inconsiderable size, but that on Miyake-shima, namely, Oyama, rises to a height of 2707 ft. The most southerly island, Hachijo-shima, has a still higher peak, Dsubo-take (2838 ft.), but it does not emit any smoke.
J

A letter of the alphabet which, as far as form is concerned, is only a modification of the Latin I and dates back with a separate value only to the 15th century. It was first used as a special form of initial I, the ordinary form being kept for use in other positions. As, however, in many cases initial i had the consonantal value of the English y in iugum (yoke), &c., the symbol came to be used for the value of y, a value which it still retains in German: Jai jung, &c. Initially it is pronounced in English as an affricate dzh. The great majority of English words beginning with j are (1) of foreign (mostly French) origin, as "jaundice," "judge"; (2) imitative of sound, like "jaw" (the verb); or (3) influenced by analogy, like "jaw" (influenced by chaw, according to Skeat). In early French g when palatalized by e or i sounds became confused with consonantal i (y), and both passed into the sound of j which is still preserved in English. A similar sound-change takes place in other languages, e.g. Lithuanian, where the resulting sound is spelt ė. Modern French and also Provençal and Portuguese have changed j=dszh into ĺ (sh). The sound initially is sometimes represented in English by g: gem, goat as well as j: jug. At the end of modern English words the same sound is represented by ĵ as in judge, French juge. In this position, however, the sound occurs also in genuine English words like bridge, sedge, singe, but this is true only for the southern dialects on which the literary language is founded. In the northern dialects the pronunciation as brig, seg, sing still survives.

JA’ALIN (from Jā’al, to settle, i.e. "the squatters"), an African tribe of Semitic stock. They formerly occupied the country on both banks of the Nile from Khartum to Abu Hamed. They claim to be of the Koreish tribe and even trace descent from Abbas, uncle of the prophet. They are of Arab origin, but now of very mixed blood. According to their own tradition they emigrated to Nubia in the 12th century. They were at one time subject to the Funj kings, but their position was in a measure independent. At the Egyptian invasion in 1820 they were the most powerful of Arab tribes in the Nile valley. They submitted at first, but in 1822 rebelled and massacred the Egyptian garrison at Shendi. The revolt was mercilessly suppressed, and the Ja’alin were thenceforward looked on with suspicion. They were almost the first of the northern tribes to join the mahdi in 1884, and it was their position to the north of Khartum which made communication with General Gordon so difficult. The Ja’alins are now a semi-nomad agricultural people. Many are employed in Khartum as servants, guards and watchmen. They are a proud religious people, formerly notorious as cruel slave dealers. J. L. Burckhardt says the true Ja’alin from the eastern desert is exactly like the Bedouin of eastern Arabia.

JABIRU, according to Marcgrave the Brazilian name of a bird, subsequently called by Linnaeus Mysteria americana, one of the largest of the storks, Ciconiidae, which occurs from Mexico southwards to the territory of the Argentine Republic. It stands between 4 and 5 ft. in height, and is conspicuous for its massive bill, slightly upturned, and its entirely white plumage; but the head and neck are bare and black, except for about the lower third part of the latter, which is bright red in the living bird. Very nearly allied to Mysteria, and also commonly called jabirus, are the birds of the genera Ephippiorhynchus and Ephippiorhynchus—formerly containing one or (in the opinion of some) two species, X. australis and X. indicus, and the latter one only, E. senegalensis. These belong to the countries indicated by their names, and differ chiefly by their feathered head and neck, while the last is sometimes termed the saddle-billed stork from the very singular shape of its beak. Somewhat more distantly related are the gigantic birds known to Europeans in India and elsewhere as adjutant birds, belonging to the genus Lepopolius, distinguished by their sad-coloured plumage, their black scabrous head, and their enormous tawny pouch, which depends occasionally some 16 in. or more in length from the lower part of the neck, and seems to be connected with the respiratory and not, as commonly believed, with the digestive system. In many parts of India, for instance, the largest of these birds, the hargila as Hindus call it, is a most efficient scavenger, sailing aloft at a vast height and descending on the discovery of offal, though frogs and fishes also form part of its diet. It familiarly enters the large towns, in many of which an account of its services is strictly protected from injury, and, having satisfied its appetite, seeks the repose it has earned, sitting with its feet extended in front in a most grotesque attitude. A second and smaller species, L. javanicus, has a more southern and eastern range; while a third, L. crumenifer, of African origin, and often known as the marabou-stork, gives its name to the beautifully soft feathers so called, which are the under-tail-coverts; the "marabout" feathers of the plume-trade are mostly supplied by other birds, the term being apparently applied to any downy feathers.

JABLOCHKOV, PAUL (1847-1894), Russian electrical engineer and inventor, was born at Serdobsk, in the government of Saratov, on the 14th of September 1847, and educated at St Petersburg. In 1871 he was appointed director of the telegraph lines between Moscow and Kursk, but in 1875 he resigned his position in order to devote himself to his researches on electric lighting by arc lamps, which he had already taken up. In 1876 he settled in Paris, and towards the end of the year brought out his famous "candles," known by his name, which consisted of two carbon parallel rods, separated by a non-conducting partition; alternating currents were employed, and the candle was operated by a high-resistance carbon match connecting the tips of the rods, a true arc forming between the parallel carbons when this burnt off, and the separators volatilizing as the carbons burnt away. For a few years his system of electric lighting was widely adopted, but it was gradually superseded...
(see LIGHTING: Electric) and is no longer in use. Jablochkov made various other electrical inventions, but he died in poverty, having returned to Russia on the 10th of March 1834.

Jablonski, Daniel Ernst (1660–1741), German theologian, was born at Nassenhuben, near Danzig, on the 20th of November 1660. His father was a minister of the Moravian Church, who had taken the name of Peter Figulus on his baptism; the son, however, preferred the Bohemian family name of Jablonski. His maternal grandfather, Johann Amos Comenius (d. 1670), was a bishop of the Moravian Church. Having studied at Frankfort-on-the-Oder and at Oxford, Jablonski entered upon his career as a preacher at Magdeburg in 1683, and then from 1686 to 1691 he was the head of the Moravian college at Lissa, a position which had been filled by his grandfather. Still retaining his connexion with the Moravians, he was appointed court preacher at Königsberg in 1691 by the elector of Brandenburg, Frederick III., and, here, entering upon a career of great activity, he soon became a person of influence in court circles. In 1693 he was transferred to Berlin as court preacher, and in 1699 he was consecrated a bishop of the Moravian Church. At Berlin Jablonski worked hard to bring about a union between the followers of Luther and those of Calvin; the courts of Berlin, Hanover, Brunswick and Gotha were interested in his scheme, and his principal helper was the philosopher Leibnitz. His idea appears to have been to form a general union between the German, the English and the Swiss Protestants, and thus to establish a eademque sanata catholica et apostolica eademque evangelica et reformata ecclesia. For some years negotiations were carried on with a view to attaining this end, but eventually it was found impossible to surmount the many difficulties in the way. Jablonski and Leibnitz, however, did not cease to believe in the possibility of accomplishing their purpose. Jablonski's next plan was to reform the Church of Prussia by introducing into it the episcopate, and also the liturgy of the English Church, but here again he was unsuccessful. As a scholar Jablonski brought out a Hebrew edition of the Old Testament, and translated Bentley's A Confutation of Atheism into Latin (1696). He had some share in founding the Berlin Academy of Sciences, of which he was president in 1733, and he received a degree from the university of Oxford. He died on the 25th of May 1741.

Jablonski's son, Paul Ernst Jablonski (1693–1757), was professor of theology and philosophy at the university of Frankfort-on-the-Oder.

Editions of the letters which passed between Jablonski and Leibnitz, relative to the proposed union, were published at Leipzig in 1747 and at Dorpat in 1809.

Jaborandi, a name given in a generic manner in Brazil and South America generally to a number of different plants, all of which possess more or less marked sialoagogue and sudorific properties. In the year 1875 a drug was introduced under the above name to the notice of medical men in France by Dr. Coutinho of Pernambuco, its botanical source being then unknown. Pilocarpus pinnatifolius, a member of the natural order Rutaceae, the plant from which it is obtained, is a slightly branched shrub about 10 ft. high, growing in Paraguay and the eastern provinces of Brazil. The leaves, which are placed alternately on the stem, are often 1½ ft. long, and consist of from two to five pairs of opposite leaflets, the terminal one having a longer pedicel than the others. The leaflets are oval, lanceolate, entire and obtuse, with the apex often slightly indented, from 3 to 4 in. long, and 1 to 1½ in. broad in the middle. When held up to the light they may be observed to have scattered all over them numerous pellucid dots or receptacles of secretion immersed in the substance of the leaf. The leaves in size and texture bear some resemblance to those of the cherry-lauore (Prunus laurocerasus), but are less polished on the upper surface. The flowers, which are produced in spring and early summer, are borne on a raceme, 6 or 8 in. long, and the fruit consists of five carpels, of which not more than two or three usually arrive at maturity. The leaves are the part of the plant usually imported, although occasionally the stems and roots are attached to them. The active principle for which the name pilocarpine, suggested by Holmes, was ultimately adopted, was discovered almost simultaneously by Hardy in France and Gerrard in England, but was first obtained in a pure state by Petit of Paris. It is a liquid alkaloid, slightly soluble in water, and very soluble in alcohol, ether and chloroform. It strongly rotates the plane of polarization to the right, and forms crystalline salts of which the nitrate is that chiefly used in medicine. The nitrate and phosphate are insoluble in ether, chloroform and benzol, while the hydrochlorate and hydrobromate dissolve both in these menstrua and in water and alcohol; the sulphate and acetate being deliquescent are not employed medicinally. The formula of the alkaloid is C_{7}H_{12}N_{2}O_{3}.

Certain other alkaloids are present in the leaves. They have been named jaborine, jaboridene and pilocarpidine. The first of these is the most important and constant. It is possibly derived from pilocarpine, and has the formula C_{9}H_{18}N_{2}O_{4}. Jaborine resembles atropine pharmacologically, and is therefore antagonistic to pilocarpine. The various preparations of jaborandi leaves are therefore undesirable for therapeutic purposes, and only the nitrate of pilocarpine itself should be used. This is a white crystalline powder, soluble in the ratio of about one part in ten of cold water. The dose is 1/4 to 1/2 grain by the mouth, and up to one-third of a grain hypodermically, in which fashion it is usually given.

The action of this powerful alkaloid closely resembles that of physostigmine, but whereas the latter is specially active in influencing the heart, the eye and the spinal cord, pilocarpine exerts its greatest power on the secretions. It has no external action. When taken by the mouth the drug is rapidly absorbed and stimulates the secretions of the entire alimentary tract, though not of the liver. The action on the salivary glands is the most marked and the best understood. The great flow of saliva is due to an action of the drug, after absorption, on the terminations of the chorda tympani, sympathetic and other nerves of salivary secretion. The gland cells themselves are unaffected. The nerves are so violently excited that direct stimulation of them by electricity adds nothing to the rate of salivary flow. The action is antagonized by atropine, which paralyses the nerve terminals. About 1/16th of a grain of atropine
antagonizes half a grain of pilocarpine. The circulation is depressed by the drug, the pulse being slow and the blood pressure falling. The chief therapeutic use is due to stimulation of the vagus, but the dilatation of the blood-vessels does not appear to be due to a specific action upon them. The drug does not kill by its action on the heart. Its dangerous action is upon the bronchial secretion, which is greatly increased. Pilocarpine is not only the most powerful sudorific but also the most powerful diaphoretic known. One dose may cause the flow of nearly a pint of sweat in an hour. The action is due, as in the case of the salivation, to stimulation of the terminals of the sudomotor nerves, a diuretic action being frequently noticed.

The oculomotor is locally depressed when excitement is produced. Bright's river was adopted by the Cuculidae, and in 1875 it was reversed to K. Bixa there is also in both cases an action on the medullary centres for these secretions. Just as the saliva is a true secretion containing a high proportion of pyaline and salts, and is not a mere transudation of water, so the perspiration is found to be a true secretion and is diaphoretic and diuretic. The secretion, diaphoresis, and the depression of the circulation usually cause a fall in temperature of about 2°F. The drug is excerted unchanged in the urine. It is a mild diuretic. When given internally or applied locally to the eye it powerfully stimulates the terminals of the oculomotor nerves in the iris and ciliary muscle, causing external contraction of the pupil and spasm of accommodation. The tension of the eyeball is at first raised but afterwards lowered.

The chief therapeutic use of the drug is as a diaphoretic in chronic Bright's disease. It is also used to aid the growth of the hair—in which it is sometimes successful—in cases of inordinate thirst, when one-tenth of a grain with a little bismuth held in the mouth may be of much value; in cases of lead and mercury poisoning, when the drug will aid in the elimination of the poison in the secretions; in galactagogue; and in cases of atrope poisoning (though here it is of doubtful value).

JACA, a city of northern Spain, in the province of Huesca, 114 m. by rail N. by W. of Saragossa, on the left bank of the river Aragon, and among the southern slopes of the Pyrenees, 2380 ft. above the sea. Pop. (1900), 4934. Jaca is an episcopal see, and was formerly the capital of the Aragones county of Sobrarbe. Its massive Gothic cathedral dates at least from the 11th century, and possibly from the 9th. The city derives some importance from its position on the ancient frontier road from Saragossa to Pau. In August 1064 the French and Spanish governments agreed to supplement this trade-route by building a railway from Ororon in the Basses Pyrénées to Jaca. Various frontier defence works were constructed in the neighbourhood at the close of the 19th century.

The origin of the city is unknown. The Jaccetani (Iáxeyvao) are mentioned as one of the most celebrated of the numerous small tribes inhabiting the basin of the Ebro by Strabo, who adds that their territory was the theatre of the wars which took place in the 1st century B.C. between Sertorius and Pompey. They are probably identical with the Lacetani of Livy (xxi. 60, 61) and Caesar (B.C. 160). Early in the 8th century Jaca fell into the possession of the Moors, by whose writers it is referred to under the name of Dyaka as one of the chief places in the province of Sarposta (Saragossa). The date of its reconquest is uncertain, but it must have been before the time of Ramiro I. of Aragon (1035-1063), who gave it the title of “city,” and in 1063 held within its walls a council, which, inasmuch as the people were called in to sanction its decrees, is regarded as of great importance in the history of the parliamentary institutions of the Peninsula. In 1301 it was granted by King Philip V. from whom, in consequence, it received the title of “city, most noble, most loyal and victorious.” During the Peninsula War it surrendered to the French in 1809, and was recaptured in 1814.

JACAMAR, a word formed by Brisson from Jacameri, the Brazilian name of a bird, as given by Marcgrave, and since adopted in most European tongues for the species to which it was first applied and others allied to it, forming the family Galbulidae 1 of ornithologists, the precise position of which is uncertain, since the best authorities differ. All will agree that the jacamars belong to the great heterogeneous group called by Nitzsch Picarinae, but further into detail it is hardly safe to go. The Galbulidae have zygocaudyctous or pair-toed feet, like the Cuculidae, Boucicautidae and Picidae, they also resemble both the latter in laying glossy white eggs, but in this respect they bear the same resemblance to the Momotidae, Aedimidae, Meropidae.

1 Galbula was first applied to Marcgrave’s bird by Moehring. It is a form of Galbus, and seems to have been one of the many names of the golden oriole. See Icterus.

—some other groups, to which affinity has been claimed for them. In the opinion of Scater (A Monograph of the Jacamars and Puff-birds) the jacamars form two groups—one consisting of the single genus and species Jacamorops aureus (J. grandis of most authors), and the other including all the rest, viz. Urogalba with two species, Galbula with nine, Brachygaliul with five, and Jacamorops and Galbolicoreychnus with one each. They are all rather small birds, the largest known being little over 10 in. in length, with long and sharply pointed bills, and the plumage more or less resplendent with golden or bronze reflections, but at the same time comparatively soft. Jacamorops tridactyla differs from all the rest in possessing but three toes (as its name indicates), on each foot, the hallux being deficient. With the exception of Galbula melanogenia, which is found also in Central America and southern Mexico, all the jacamars inhabit the tropical portions of South America eastward of the Andes, Galbula ruficauda, however, extending its range to the islands of Trinidad and Tobago. 2 Very little is known of the habits of any of the species. They are seen sitting motionless on trees, sometimes solitary, at other times in companies, whence they suddenly dart off at any passing insect, catch it on the wing, and return to their perch. Of their nidification almost nothing has been recorded, but the species occurring in Tobago is said by Kirk to make its nest in marl-banks, digging a hole about an inch and a half in diameter and some 18 in. deep.

(A. N.)

JAČANÁ, the Brazilian name, according to Marcgrave, of certain birds, since found to have some allies in other parts of the world, which are also very generally called by the same appellation. They have been most frequently classed with the water-hens or rails (Rallidae), but are now recognized by many systematists as forming a separate family, Parridae, 3 whose leaning seems to be rather towards the Limicolae, as apparently first

suggested by Blyth, a view which is supported by the osteological observations of Parker (Proc. Zool. Society, 1863, p. 513), though denied by A. Milne-Edwards (Ois. foss. de la France, ii. p. 110). The most obvious characteristic of this group of birds is the extraordinary length of their toes and claws, whereby they are enabled to walk with ease over water-lilies and other aquatic plants growing in rivers and lakes. The family has been divided into four genera—of which Parra, as now restricted, inhabits South America; Melopidius, hardly differing from it, has representatives in Africa, Madagascar and the Indian region; Hydractylus, also very nearly allied to Parra, belongs to the

Pheasant-tailed Jaçana.
JACINI—JACK

northern portion of the Australian region; and Hydrophasianus, the most extravagant form of the whole, is found in India, Ceylon and China. In habits the jackdaws have much in common with the water-hens, but that fact is insufficient to warrant the affinity asserted to exist between the two groups; for in their osteological structure there is much difference, and the resemblance seems to be only that of analogy. The Paridae lay very peculiar eggs of a rich olive-brown colour, in most cases closely marked with dark lines, thus presenting an appearance by which they may be readily known from those of any other birds, though an approach to it is occasionally to be noticed in those of certain Limicolae, and especially of certain Charadriidae. (A. N.)

JACINI, STEFANO, COUNT (1827-1891), Italian statesman and economist, was descended from an old and wealthy Lombard family. He studied in Switzerland, at Milan, and in German universities. During the period of the Austrian restoration in Lombardy (1849-1859) he devoted himself to literary and economic studies. For his work on La Proprietà fondiaria in Lombardia (Milan, 1856) he received a prize from the Milanese Società d’incoraggiamento di scienze e lettere and was made a member of the Istituto Lombardo. In another work, Sulle condizioni della Valtellina (Milan, 1858, translated into English by W. E. Gladstone), he exposed the evils of Austrian rule, and he drew up a report on the general conditions of Lombardy and Venetia for Cavour. He was minister of Public Works under Cavour in 1860-1861, in 1864 under La Marmora, and down to 1867 under Ricasoli. In 1866 he presented a bill favouring Italy’s participation in the construction of the St Gotthard tunnel. He was instrumental in bringing about the alliance with Prussia for the war of 1866 against Austria, and in the organization of the Italian railways. From 1881 to 1886 he was president of the commission to inquire into the agricultural conditions of Italy, and edited the voluminous report on the subject. He was created senator in 1870, and given the title of count in 1880. He died in 1891.

JACK, a word with a great variety of meanings and applications, all traceable to the common use of the word as a by-name of a man. The question has been much discussed whether “Jack” as a name is an adaptation of Fr. Jacques, i.e. James, from Lat. Iacobus, Gr. Ιακώβος, or whether it is a direct pet formation from John, which is its earliest and universal use in English. In the History of the Monastery of St Augustine at Canterbury, 1414, Jack is given as a form of John—Mos est Saxonum . . . . verba et nomina transformare . . . . ut . . . pro Johanne Jankin sive Jacke (see E. W. B. Nicholson, The Pedigree of Jack and other Allied Names, 1802). “Jack” was early used as a general term for any man of the common people, especially in combination with the woman’s name Jill or Gill, as in the nursery rhyme. The New English Dictionary quotes from the Coventry Mysteries, 1450: “And I wolpe kepe the fete this tyde Thou ther comen both Iakke and Gylle.” Familiar examples of this generic application of the name are Jack or Jack Tar for a sailor, which seems to date from the 17th century, and such compound uses as cheap-jack and steetle-jack, or such derivations as “jack-in-the-box” “jack-o’-lantern.” It is a further extraneous form of this that gives the name to the knife in a pack of cards, and also to various animals, as jackdaw, jack-snipe, jack-rabbit (a species of large prairie-hare); it is also used as a general name for pike.

The many applications of the word “jack” to mechanical devices and other objects follow two lines of reference, one to objects somewhat smaller than the ordinary, the other to appliances which take the place of direct manual labour or assist or save it. Of the first class may be noticed the use of the term for the small object bowl in the game of bowls or for jack rafters, those rafters in a building shorter than the main rafters, especially the end rafters in a hipped roof. The use of jack as the name for a particular form of ship's flag probably arose thus, for it is always a smaller flag than the ensign. The jack is flown on a staff on the bowsprit of a vessel. In the British nay the jack is a small Union flag. (The Union flag should not be styled a Union Jack except when it is flown as a jack.) The jack of other nations is usually the canton of the ensign, as in the German and the United States navies, or else is a smaller form of the national ensign, as in France. (See Flag.)

The more common use of “jack” is for various mechanical and other devices originally used as substitutes for men or boys. Thus the origin of the boot-jack and the meat-jack is explained in Isaac Watts’s Logic, 1724: “So foot boys, who had frequently the common name of Jack given them, were kept to turn the spit or pull off their masters’ boots, but when instruments were invented for both these services, they were both called jacks.” The New English Dictionary finds a transitional sense in the use of the name “jack” for mechanical figures which strike the hours on a bell of a clock. Such a figure in the clock of St Lawrence Church at Reading is called a jack in the parish accounts for 1498-1499. There are many different applications of “jack,” to certain levers and other parts of textile machinery, to metal plugs used for connecting lines in a telephone exchange, to wooden uprights connecting the levers of the keys with the movements of some devices, to stage cupboards or stairs, to a framework forming a seat or staging which can be fixed outside a window for cleaning or painting purposes, and to many devices containing a roller or winch, as in a jack-towel, a long towel hung on a roller. The principal mechanical application of the word, however, is to a machine for raising weights from below. A jack chain, so called from its use in meat-jacks, is one in which the links, formed each in a figure of eight, are set in planes at right angles to each other, so that they are seen alternately flat or edgyways.

In most European languages the word “jack” in various forms appears for a short upper outer garment, particularly in the shape of a sleeveless (quilted) leather jerkin, sometimes with plates or rings of iron sewn to it. It was the common coat of defence of the infancy of the middle ages. The word in this case is of French origin and was an adaptation of the common name Jacques, as being a garment worn by the common people. In French the word is jaquen, and it appears in Italian as giasco, in Dutch jak, Swedish jackska and German Jacke, still the ordinary name for a short coat, as is the English jacket, from the diminutive French jaquette. It was probably from some resemblance to the leather coat that the well-known leather vessels for holding liquor or for drinking were known as jacks or black jacks. These drinking vessels, which are often of great size, were not described as black jacks till the 16th century, though known as jacks much earlier. Among the important specimens that have survived to this day is one with the initials and crown of Charles I. and the date, 1646, which came from Kensington Palace and is now in the British Museum; one each at Queen’s College and New College, Oxford; two at Winchester College; one at Eton College; and six at the Chelsea Hospital. Many specimens are painted with shields of arms, initials and other devices; they are very seldom mounted in silver, though spurious specimens with silver medallions of Cromwell and other prominent personages exist. At the end of the 17th century a smaller form of a different kind, like an ordinary drinking mug with a tapering cylindrical body, often mounted in silver, came into vogue in a limited degree. The black jack is a distinct type of drinking vessel from the leather boot and the bombard. The jack-boot, the heavy riding boot with long flap covering the knee and part of the thigh, and worn by troopers first during the 17th century, was so called probably from association with the leather jack or jerkin. The jack-boot is still worn by the Household Cavalry, and the name is applied to a high riding boot reaching to the knee as distinguished from the riding boot with tops, used in full hunting-kit or by grooms or coachmen.

Jack, sometimes spelled jak, is the common name for the fruit of the tree Artiocarpus integrifolia, found in the East Indies. The word is an adaptation of the Portuguese jaca from the Malay name chakka. (See Bread Fruit.)

The word “jackanapes,” now used as an opprobrious term for a swaggering person with impertinent ways and affected airs
and graces, has a disputed and curious history. According to the *New English Dictionary* it first appears in 1430 in reference to William de la Pole, duke of Suffolk (*Political Poems*, "Rolls Series," II. 224). "Jack Napes with his clogge hath tiele Talbot oure gentle dogge." Suffolk's badge was a clog and chain, such as was often used for an ape kept in captivity, and he is alluded to (ibid. 222) as "Ape clogge." Jack Napes, Jack o' Napes, Jackanapes, was a common name for a tame ape from the 16th century, and it seems more likely that the word is a fanciful name for a monkey than that it is due to the nickname of Suffolk.

**JACKAL** (Turk. *chākdāl*), a name properly restricted to *Canis aureus*, a wolf-like wild member of the dog family inhabiting eastern Europe and southern Asia, but extended to include a number of allied species. Jackals resemble wolves and dogs in their dentition, the round eye-pupils, the period of gestation, and to a large extent also in habits. The European species grows to a height of 15 in. at the shoulders, and to a length of about 2 ft., exclusive of its bushy tail. Typically the fur is greyish-yellow, darker on the back and lighter beneath. The range of the common jackal (*C. aureus*) extends from Dalmatia to India, the species being represented by several local races. In Senegal this species is replaced by *C. anthus*, while in Egypt occurs the much larger *C. lupaster*, commonly known as the Egyptian wolf. Nearly allied to the last is the so-called Indian wolf (*C. pallipes*). Other African species are the black-backed jackal (*C. mesomelas*),

afford excellent sport. Jackals are readily tamed; and domesticated individuals are said, when called by their masters, to wag their tails, crouch and throw themselves on the ground, and otherwise behave in a dog-like fashion. The jackal, like the fox, has an offensive odour, due to the secretion of a gland at the base of the tail.

**JACKDAW**, or simply DAW (Old Low German, *Daha*; Dutch, *Kaaaw*), one of the smallest species of the genus *Corvus* (see *Crow*), and a very well known inhabitant of Europe, the *C. monedula* of ornithologists. In some of its habits it much resembles its congenor the rook, with which it constantly associates during a great part of the year; but, while the rook only exceptionally places its nest elsewhere than on the boughs of trees and open to the sky, the daw almost invariably chooses holes, whether in rocks, hollow trees, rabbit-burrows or buildings. Nearly every church-tower and castle, ruined or not, is more or less numerously occupied by daws. Chimneys frequently give them the accommodation they desire, much to the annoyance of the householder, who finds the funnel choked by the quantity of sticks brought together by the birds, since their industry in collecting materials for their nests is as marvellous as it often is futile. In some cases the stack of loose sticks piled up by daws in a belfry or tower has been known to fall, destroying a structure 15 ft. in height, and hence this species may be accounted one of the greatest nest-builders in the world. The style of architecture practised by the daw thus brings it more than the rook into contact with man, and its familiarity is increased by the boldness of its disposition which, though tempered by discreet cunning, is hardly surpassed among birds. Its small size, in comparison with most of its congeners, alone incapacitates it from inflicting the serious injuries of which some of them are often the authors, yet its pilferings are not to be denied, though on the whole its services to the agriculturist are great, for in the destruction of injurious insects it is hardly inferior to the rook, and it has the useful habit of riddling sheep, on whose backs it may be frequently seen perched, of some of their parasites.

The daw displays the glossy black plumage so characteristic of the true crows, varied only by the hoary grey of the ear-coverts, and of the nape and sides of the neck, which is the mark of the adult; but examples from the east of Europe and western Asia have these parts much lighter, passing into a slivery white, and have been deemed by some ornithologists to constitute a distinct species (*C. collaris*, Drumm.). Further to the eastward occurs the *C. dauuricus* of Pallas, which has not only the collar broader and of a pure white, but much of the lower parts of the body white also. Japan and northern China are inhabited also by a form resembling that of western Europe, but wanting the grey nape of the latter. This is the *C. neglectus* of Professor Schlegel, and is said by Dresser, on the authority of Swinhoe, to interbreed frequently with *C. dauuricus*. These are all the birds that seem entitled to be considered daws, though Dr Bowdler Sharpe (*Cat. B. Brit. Museum*, iii. 24) associates with them (under the little-deserved separate generic distinction *Coloeus*) the fish-crow of North America, which appears both in structure and in habits to be a true crow.

(A. N.)

**JACKSON, ANDREW** (1767–1845), seventh president of the United States, was born on the 15th of March 1767, at the Waxhaw or Warsaw settlement, in Union county, North Carolina, or in Lancaster county, South Carolina, whither his parents had immigrated from Carrickfergus, Ireland, in 1765. He played a slight part in the War of Independence, and was never more in danger than when he wasdesigner in a battle resulting in a lifelong dislike of Great Britain. He studied law at Salisbury, North Carolina, was admitted to the bar there in 1787, and began to practise at Waxhaw, Guilford county, North Carolina, where for a time he was a constable and deputy-sheriff. In 1788, having been appointed prosecuting attorney of the western district of North Carolina (now the state of Tennessee), he removed to Nashville, the seat of justice of the district. In 1791 he married Mrs Rachel Robards (nee Donelson), having heard that her husband had obtained a divorce through the legislature of Virginia. The
legislative act, however, had only authorized the courts to determine whether or not there were sufficient grounds for a divorce and to grant or withhold it accordingly. It was more than two years before the divorce was actually granted, and only on the basis of the fact that Jackson and Mrs. Robards were then living together. On receiving this information, Jackson had the marriage ceremony performed a second time.

In 1796 Jackson assisted in framing the constitution of Tennessee. From December 1796 to March 1797 he represented that state in the Federal House of Representatives, where he distinguished himself as an irreconcilable opponent of President Washington, and was one of the twelve representatives who voted against the address to him by the House. In 1797 he was elected a United States senator; but he resigned in the following year. He was judge of the supreme court of Tennessee from 1798 to 1804. In 1804–1805 he contracted a friendship with Aaron Burr; and at the latter's trial in 1807 Jackson was one of his conspicuous champions. Up to the time of his nomination for the presidency, the biographer of Jackson finds nothing to record but military exploits in which he displayed perseverance, energy and skill, of a very high order, and a succession of personal acts in which he showed himself ignorant, violent, peremptory, impetuous, and sometimes and astonishingly indiscreet. His combative disposition led him into numerous personal difficulties. In 1795 he fought a duel with Colonel Waitstill Avery (1745–1821), an opposing counsel, over some angry words uttered in a court room; but both, it appears, intentionally fired wild. In 1806 in another duel, after a long and bitter quarrel, he killed Charles Dickinson, and Jackson himself received a wound from which he never fully recovered. In 1813 he exchanged shots with Thomas Hart Benton and his brother Jesse in a Nashville tavern, and received a second wound. Jackson and Thomas Hart Benton were later reconciled.

In 1814, as major-general of militia, he commanded in the campaign against the Creek Indians in Georgia and Alabama, defeated them at Talladega, on the 9th of November 1813, and at Tohopeka, on the 29th of March 1814, and thus first attracted public notice by his talents. In May 1814 he was commissioned as major-general in the regular army to serve against the British; in November he captured Pensacola, Florida, then owned by Spain as the British as a base of operations; and on the 8th of January 1815 he inflicted a severe defeat on the enemy before New Orleans, the contestants being unaware that a treaty of peace had already been signed. During his stay in New Orleans he proclaimed martial law, and carried out his measures with unrelenting sternness, banishing from the town a judge who attempted resistance. When civil law was restored, Jackson was fined $1000 for contempt of court. In 1814 Congress ordered the fine with interest ($2700) to be repaid. In 1818 Jackson received the command against the Seminoles. His conduct in following them up into the Spanish territory of Florida, in seizing Pensacola, and in arresting and executing two British subjects, Alexander Arbuthnot and Robert Ambrister, gave rise to much hostile comment in the cabinet and in Congress, but the negotiations for the purchase of Florida put an end to the diplomatic difficulty. In 1821 Jackson was military governor of the territory of Florida, and there again he came into collision with the civil authority. From this, as from previous troubles, John Quincy Adams, then secretary of state, extricated him.

In July 1822 the general assembly of Tennessee nominated Jackson for president; and in 1823 he was elected to the United States Senate, from which he resigned in 1825. The rival candidates for the office of president in the campaign of 1824 were Jackson, John Quincy Adams, W. H. Crawford and Henry Clay. Jackson obtained the largest number of votes (99) in the electoral college (Adams receiving 84, Crawford 41 and Clay 37); but no one had an absolute majority, and it thus became the duty of the House of Representatives to choose one of the three candidates—Adams, Jackson and Crawford—who had received the greatest numbers of electoral votes. At the election by the house (February 9, 1825) Adams was chosen, receiving the votes of 13 states, while Jackson received the votes of 7 and Crawford the votes of 4. Jackson, however, was recognized by the able politician as the coming man.

Van Buren and others, going into opposition under his banner, waged from the first a relentless and factious war on the administration. Van Buren was the most adroit politician of his time; and Jackson was in the hands of very astute men, who advised and controlled him. He was easy to lead when his mind was in solution; and he gave his confidence freely where he had once placed it. He was not suspicious, but if he withdrew his confidence he was implacable. When his mind crystallized on a notion that had a personal significance to himself, that notion became a hard fact that filled his field of vision. When he was told that he had been cheated in the matter of the presidency, he was sure of it, although those who told him were by no means so.

There was great significance in the election of Jackson in 1828. A new generation was growing up under new economic and social conditions. They felt great confidence in themselves and great independence. They despised tradition and Old World ways and notions; and they accepted the Jeffersonian dogmas, not only as maxims, but as social forces—the causes of the material prosperity of the country. By the generation therefore, Jackson was recognized as a man after their own heart. They liked him because he was vigorous, brusque, uncouth, relentless, straightforward and open. They made him president in 1828, and he fulfilled all their expectations. He had 178 votes in the electoral college against 83 given for Adams. Though the work of redistribution of offices began almost at his inauguration, it is yet an incorrect account of the matter to say that Jackson corrupted the civil service. His administration is rather the date at which a system of democracy, organized by the use of patronage, was introduced into the federal arena by Van Buren. It was at this time that the Democratic or Republican party divided, largely along personal lines, into Jacksonian Democrats and National Republicans, the latter led by such men as Henry Clay and J. Q. Adams. The administration itself had two factions in it from the first, the faction of Van Buren, the secretary of state 1829–1831, and that of Calhoun, vice-president in 1829–1831. The refusal of the wives of the cabinet and of Mrs. Calhoun to accord social recognition to Mrs. J. H. Eaton brought about a rupture, and in April 1831 the whole cabinet was reorganized. Van Buren, a widower, sided with the president in this affair and grew in his favour. Jackson in the meantime had learned that Calhoun as secretary of war had wished to censure him for his actions during the Seminole war in Florida in 1818, and henceforth he regarded the South Carolina statesman as his enemy. The result was that Jackson transferred to Van Buren his support for succession in the presidency. The relations between Jackson and his cabinet were unlike those existing under his predecessors. Having a military point of view, he was inclined to look upon the cabinet members as inferior officers, and when in need of advice he usually consulted a group of personal friends, who came to be called the "Kitchen Cabinet." The principal members of this clique were William B. Lewis (1784–1860), Amos Kendall and Duff Green, the last named being editor of the United States Telegraph, the organ of the administration.

In 1828 Jackson was re-elected by a large majority (219 electoral votes to 49) over Henry Clay, his chief opponent. The battle raged mainly around the re-charter of the Bank of the United States. It is probable that Jackson's advisers in 1828 had told him, though erroneously, that the bank had worked against him, and then were not able to control him. The first message of his first presidency had contained a severe reflection on the bank; and in the very height of this second campaign (July 1832) he vetoed the re-charter, which had been passed in

1 The charge was freely made then and afterwards (though, it is now believed, without justification) that Clay had supported Adams and by influencing his followers in the house had been instrumental in securing his election, as the result of a bargain by which Adams had agreed to pay him for his support by appointing him secretary of state.
the session of 1831–1832. Jackson interpreted his re-election as an approval by the people of his war on the bank, and he pushed it with energy. In September 1833 he ordered the public deposits in the bank to be transferred to selected local banks, and entered upon the "experiment" whether these could not act as fiscal agents for the government, and whether the desire to get the deposits would not induce the local banks to adopt sound rules of currency. During the next session the Senate passed a resolution condemning his conduct. Jackson protested, and after a hard struggle, in which Jackson's friends were led by Senator Thomas Hart Benton, the resolution was ordered to be expunged from the record, on the 16th of January 1837.

In 1832, when the state of South Carolina attempted to "nullify" the tariff laws, Jackson at once took steps to enforce the authority of the federal government, ordering two war vessels to Charleston and placing troops within convenient distance. He also issued a proclamation warning the people of South Carolina against the consequences of their conduct. In the troubles between Georgia and the Cherokee Indians, however, he took a different stand. Shortly after his first election Georgia passed an act extending over the Cherokee country the civil laws of the state. This was contrary to the rights of the United States. In the matter the state, therefore, was subsequently declared the act void (1832). Jackson, however, having the frontiersman's contempt for the Indian, refused to enforce the decision of the court (see NULLIFICATION; GEORGIA: History).

Jackson was very successful in collecting old claims against various European nations for spoliations inflicted under Napoleon's continental system, especially the French spoliation claims, with reference to which he acted with aggressiveness and firmness. Aiming at a currency to consist largely of specie, he caused the payment of these claims to be received and imported in specie as far as possible; and in 1836 he ordered land-agents to receive for land nothing but specie. About the same time a law passed Congress for distributing among the states some $35,000,000 balance belonging to the United States, the public debt having all been paid. The eighty banks of deposit in which it was lying had regarded this sum almost as a permanent loan, and had inflated credit on the basis of it. The necessary calling in of their loans in order to meet the drafts in favour of the states, combined with the breach of the over-all credit between America and Europe, and the decline in the price of cotton, brought about a crash which prostrated the whole financial, industrial and commercial system of the country for six or seven years. The crash came just as Jackson was leaving office; the whole burden fell on his successor, Van Buren.

In the 18th century the influences at work in the American colonies developed democratic notions. In fact, the circumstances were those which create equality of wealth and condition, as far as civilized men ever can be equal. The War of Independence was attended by a grand outburst of political dogmatism of the democratic type. A class of men were produced who believed in very broad dogmas of popular power and rights. There were a few rich men, but they were almost ashamed to differ from their neighbours and, in some known cases, they affected democracy in order to win popularity. After the 19th century began the class of rich men rapidly increased. In the first years of the century a little clique at Philadelphia became alarmed at the increase of the "money power," and a growing peril to democracy. They attacked with some violence, "little skill, the first Bank of the United States, and they prevented its re-charter. The most permanent interest of the history of the United States is the picture it offers of a primitive democratic society transformed by prosperity and the acquisition of capital into a great republican commonwealth. The denunciations of the "money power" and the altercation of democratic dogmas deserve earnest attention. They show the development of classes or parties in the old undifferentiated mass. Jackson came upon the political stage just when a wealthy class first existed. It was an industrial and commercial class greatly interested in the tariff, and deeply interested also in the then current forms of issue banking. The southern planters also were rich, but were agriculturists and remained philosophical Democrats. Jackson was a man of low birth, uneducated, prejudiced, and marked by strong personal feeling in all his beliefs and disbeliefs. He showed, in his military work and in his early political doings, great lack of discipline. The proposal to make him president won his assent and awakened his ambition. In anything which he undertook he always wanted to carry his point almost regardless of incidental effects on himself or others. He soon became completely engaged in the effort to be made president. The men nearest to him understood his character and played on it. It was suggested to him that the money power was against him. That meant that, to the educated or cultivated class of that day, he did not seem to be in the class from which a president should be chosen. He took the idea that the Bank of the United States was leading the money power against him, and that he was the champion of the masses of democracy and of the common people. The opposite party, led by Clay, Adams, Biddle, &c., had schemes for banks and tariffs, enterprises which were open to severe criticism. The political struggle was very intense and there were two good sides to it. Men like Thomas H. Benton, Edward Livingston, Ames Kendall, and the southern statesmen, found material for strong attacks on the bank. For the issue as Jackson's managers stated it. That meant that the masses recognized Jackson as their champion. Therefore, Jackson's personality and name became a power on the side opposed to banks, corporations and other forms of the new growing power of capital. That Jackson was a typical man of his generation is certain. He represents the spirit and temper of the free American of that day, and it was a part of his way of thinking and acting that he put his whole life and interest into the conflict. He accomplished two things of great importance in the history: he crushed excessive state-rights and established the contrary doctrine in fact and in the political orthodoxy of the democrats; he destroyed the great bank. The subsequent history of the bank left it without an apologist, and prejudiced the whole later judgment about it. The way in which Jackson accomplished these things was such that it cost the country ten years of the severest liquidation, and left conflicting traditions of public policy in the Democratic party. After he left Washington, Jackson fell into discord with his most intimate old friends, and it is believed that the cause of slavery, which he thought to be attacked and in danger.

Jackson is the only president of whom it may be said that he went out of office far more popular than he was when he entered. When he went into office he had no political opinions, only some popular notions. He left his party strong, perfectly organized and enthusiastic on a platform of low expenditure, payment of the debt, no expenditure for public improvement or for glory or display in any form and low taxes. His name still remained a spell to conjure with, and the politicians sought to obtain the assistance of his approval for their schemes; but in general his last years were quiet and uneventful. He died at his residence, "The Hermitage," near Nashville, Tennessee, on the 8th of June 1845.

Bibliography.—Of the early biographies, that by J. H. Eaton (Philadelphia, 1834) is a history of Jackson's early military exploits, written for political purposes. After President Polk's life (New York, 1843) is incomplete, extending only to 1814, James Parton's elaborate work (3 vols., New York, 1860) is still useful. Parton prepared a shorter biography for the "Great Commanders Series" (New York, 1849), which emphasizes Jackson's military career. W. G. Sumner's Andrew Jackson in the "American Statesmen Series" (Boston, 1882; revised, 1899) combines the leading facts of Jackson's life with a history of his times. W. G. Brown wrote an exploring biography for the "Riverside Geographical Series." Of more recent works the most elaborate are the History of Andrew Jackson, by A. C. Buell (New York, 1904), marred by numerous errors, and the Life and Times of Andrew Jackson, by A. S. Cogar (Nashville, 1901), Charles H. Perry's The Jacksonian Epoch (New York, 1899) is an account of national politics from 1815 to 1840, in which the antagonism of Jackson and Clay is emphasized. (W. G. S.)

JACKSON, CYRIL (1746–1819), dean of Christ Church, Oxford, was born in Yorkshire, and educated at Westminster
and Oxford. In 1771 he was chosen to be sub-preceptor to the two eldest sons of George III., but in 1776 he was dismissed, probably through some household intrigues. He then took orders, and was appointed in 1780 to the preachership at Lincoln’s Inn and to a canonry at Christ Church, Oxford. In 1783 he was elected dean of Christ Church. His devotion to the college led him to decline the bishopric of Oxford in 1799 and the primacy of Ireland in 1808. He took a leading part in framing the statute which, in 1802, launched the system of public examinations at Oxford, but otherwise he was not prominent in university affairs. On his resignation in 1809 he settled at Felpham, in Sussex, where he remained till his death.

**JACKSON, FREDERICK GEORGE** (1860— ), British Arctic explorer, was educated at Denstone College and Edinburgh University. His first voyage in Arctic waters was on a whaling-cruise in 1886–1887, and in 1893 he made a sledge-journey of 3000 miles across the frozen tundra of Siberia lying between the Ob and the Pechora. His narrative of this journey was published under the title of *The Great Frozen Land* (1893). On his return, he was given the command of the Jackson-Harmsworth Arctic expedition (1894–1897), which had for its objective the general exploration of Franz Josef Land. In recognition of his services he was raised to knighthood, and in 1898 he was made a Companion of the Danish Royal Order of St Olaf. In 1899, his account of the expedition was published under the title of *A Thousand Days in the Arctic* (1899). He served in South Africa during the Boer War, and obtained the rank of captain. His travels also include a journey across the Australian deserts.

**JACKSON, HELEN MARIA** (1831–1885), American poet and novelist, who wrote under the initials of “H. H.” (Helen Hunt), was born in Amherst, Massachusetts, on the 18th of October 1831, the daughter of Nathan Welby Fiske (1798–1847), who was a professor in Amherst College. In October 1852 she married Lieutenant Edward Bissell Hunt (1822–1863), of the U.S. corps of engineers. In 1879 she published a little volume of meditative Verses, which was praised by Emerson in the preface to his *Parnassus* (1874). In 1875 she married William S. Jackson, a banker, of Colorado Springs. She became a prolific writer of prose and verse, including juvenile tales, books of travel, household hints and novels, of which the best is *Ramona* (1884), a defence of the Indians. In 1883, as a special commissioner, Abbot, Kinnes (b. 1856), she investigated the condition and needs of the Mission Indians in California. *A Century of Dishonor* (1881) was an arraignment of the treatment of the Indians by the United States. She died on the 12th of August 1885 in San Francisco.

In addition to her publications referred to above, *Mercy Philbrick’s Choice* (1876), *Hetty’s Strange History* (1877), *Zeph* (1886), and *Sonnets and Lyrics* (1886) may be mentioned.

**JACKSON, MASON** (c. 1820–1903), British engraver, was born at Berwick-on-Tweed about 1820, and was trained as a wood engraver by his brother, John Jackson, the author of a history of this art. In the middle of the 19th century he made a considerable reputation by his engravings for the Art Union of London, and for Knight’s *Shakespeare* and other standard books; and in 1860 he was appointed art editor of the *Illustrated London News*, a post which he held for thirty years. He wrote a history of the rise and progress of illustrated journalism. He died in December 1903.

**JACKSON, THOMAS** (1570–1649), president of Corpus Christi College, Oxford, and dean of Peterborough, was born at Witton-le-Wear, and educated at Oxford. He was a probationer fellow of Corpus in 1606, and was soon afterwards elected vice-president. In 1623 he was presented to the living of St Nicholas, Newcastle, and about 1625 to the living of Winston, Durham. Five years later he was appointed president of Corpus, and in 1632 the king presented him to the living of Witney, Oxfordshire. He was made a prebendary of Winchester in 1635, and was dean of Peterborough in 1635–1639. Although originally a Calvinist, he became in later life an Arminian.

His chief work was a series of commentaries on the Apostles’ Creed, the first complete edition being entitled *The Works of Thomas Jackson, D.D.* (London, 1673). The commentaries were, however, originally published in 1613–1647, as twelve books with different titles, the first being *The Eternal Truth of Scriptures* (London, 1613).

**JACKSON, THOMAS JONATHAN** (1824–1865), known as “Stonewall Jackson,” American general, was born at Clarksburg, Virginia (now West Virginia), on the 21st of January 1824, and was descended from an Ulster family. At an early age he was left a penniless orphan, and his education was acquired in a small country school until he procured, mainly by his own energy, a nomination to the Military Academy. Lack of social graces and the deficiencies of his early education impeded him at first, but “in the end ‘Old Jack,’” as he was always called, with his desperate earnestness, his unblinching straightforwardness, and his high sense of honour, came to be regarded with something like affection.” Such qualities he displayed not less amongst the light-hearted cadets than afterwards at the head of troops in battle. After graduating he took part, as second lieutenant in the 1st U.S. Artillery, in the Mexican War. At Vera Cruz he won the rank of first lieutenant, and for gallant conduct at Contreras and Chapultepec respectively he was brevetted captain and major, a rank with which he was hourly expected. After spending his stay in the city of Mexico his thoughts were seriously directed towards religion, and, eventually entering the Presbyterian communion, he ruled every subsequent action of his life by his faith. In 1851 he applied for and obtained a professorship at the Virginia military institute, Lexington; and here, except for a short visit to Europe, he remained for ten years, teaching natural science, the theory of gunnery and battalion drill. Though he was not a good teacher, his influence both on his pupils and on those few intimate friends with whom alone he relaxed the gravity of his manner was profound, and, little as he was known to the white inhabitants of Lexington, he was revered by the slaves, to whom he showed uniform kindness, and for whose moral instruction he worked unceasingly. As to the great question at issue in 1861, Major Jackson’s ruling motive was devotion to his state, and when Virginia seceded, on the 17th of April, and the Lexington cadets were ordered to Richmond, Jackson went thither in command of the corps. His intimate friend, Governor Letcher, appreciating his gifts, sent him as a colonel of infantry to Harper’s Ferry, where the first collision of the Union forces was hourly expected. In June he received the command of a brigade, and in July promotion to the rank of brigadier-general. He had well employed the short time at his disposal for training his men, and on the first field of Bull Run they won for themselves and their brigadier, by their rigid steadiness at the critical moment of the battle, the historic name of “Stonewall.”

After the battle of Bull Run Jackson spent some time in the further training of his brigade which, to his infinite regret, he was compelled to leave behind him when, in October, he was assigned as a major-general to command in the Shenandoah Valley. His army had to be formed out of local troops, and few modern weapons were available, but the Valley regiments retained the impress of Jackson’s training till the days of Cedar Creek. Discipline was not acquired at once, however, and the first ventures of the force were not very successful. At Kerns-town, indeed, Jackson was tactically defeated by the Federals under Shields (March 23, 1862). But the Stonewall brigade had been sent to its old leader in November, and by the time that the famous Valley Campaign (see VALEY CAMPAIGNS) began Jackson’s command had attained cohesion and power of manœuvre. On the 8th of May 1862 was fought the combat of McDowell, won by Jackson against the leading troops of Frémont’s command from West Virginia. Three weeks later the forces under Banks were being driven over the Potomac at Harper’s Ferry, and Jackson was master of the Valley. Every other plan of campaign in Virginia was at once subordinated to the scheme of “trapping Jackson.” But the Confederates, marching swiftly up the Valley, slipped between the converging columns of Frémont from the west and...
McDowell from the east, and concluded a most daring campaign by the victorious actions of Cross Keys and Port Republic (5th and 6th of June). While the forces of the North were still scattered, Jackson secretly left the Valley to take a decisive part in Lee's campaign before Richmond. In the "Seven Days" Jackson was frequently at fault, but his driving energy bore no small part in securing the defeat of McClellan's advance on Richmond. Here he passed for the first time under the direct orders of Robert Lee, and the rest of his career was spent in command of the II. corps of the Army of Northern Virginia. As Lee's chief and most trusted subordinate he was throughout charged with the execution of the more delicate and difficult operations of his commander's hazardous strategy. After his victory over Banks at Cedar Mountain, near Culpeper, Virginia, Jackson led the daring march round the flank of General Pope's army, which against all theoretical rules ended in the great victory of second Bull Run. In the Maryland campaign Lieut.-General Jackson was again detached from the main army. Eleven thousand Federals, surrounded in Harper's Ferry, were forced to surrender, and Jackson rejoined Lee just in time to oppose McClellan's advance. At Antietam his corps bore the brunt of the battle, which was one of the most stubborn of modern warfare. As he was very poor, his valor was more appreciated, and his last battle, before Chancellorsville, in the thickets of the Wilderness, was his greatest triumph. By one of his swift and secret flanks marches he placed his corps on the flank of the enemy, and on the 2nd of May flung them against the Federal XII. corps, which was utterly routed. At the close of a day of victory he was reconnoitring the hostile positions when suddenly the Confederate outposts opened fire upon his staff, whom they mistook in the dark and tangled forest for Federal cavalry. Jackson fell wounded, and on the 10th of May he died at Guinea's station. He was buried, according to his own wish, at Lexington, where a statue and a memorial hall commemorate his connexion with the place; and on the spot where he was mortally wounded stands a plain granite pillar. The first contribution towards the bronze statue at Richmond was made by the negro Baptist congregation for which Jackson had laboured so earnestly in his Lexington years. He was twice married, first to Eleanor (d. 1854), daughter of George Junkin, president of Washington College, Virginia, and secondly in 1857 to Mary Anna Morrison, daughter of a North Carolina clergyman. He was a Roman Catholic, and this, together with the necessity of the Confederacy, was an irreparable loss was disputed by no one. Lee said that he had lost his right arm, and, good soldiers as were the other generals, not one amongst them was comparable to Jackson, whose name was dreaded in the North like that of Lee himself. His military character was the enlargement of his personal character—"desperate earnsetness, unflinching straightforwardness," and absolute, almost fatalist, trust in the guidance of providence. At the head of his troops, who idolized him, he was a Cromwell, adding to the zeal of a fanatic and the energy of the born leader the special military skill and trained soldierly spirit which the English commander had to gain by experience. His Christianity was conspicuous, even amongst deeply religious men like Lee and Stuart, and penetrated every part of his character and conduct.

See lives by R. L. Dabney (New York, 1883), J. E. Cooke (New York, 1866), M. A. Jackson (General Jackson's widow) (New York, 1892), and especially G. F. R. Henderson, Stonewall Jackson (London, 1898), and H. A. White, Stonewall Jackson (Philadelphia, 1909).

**JACKSON, WILLIAM** (1730-1802), English musician, was born at Exeter on the 20th of May 1730. His father, a grocer, bestowed a liberal education upon him, but, on account of the lad's strong predilection for music, was induced to place him under the care of John Silvester, the organist of Exeter Cathedral, with whom he remained about two years. In 1748 he went to London, and studied under John Travers, organist of the king's chapel. Returning to Exeter, he settled there as a teacher and composer, and in 1777 was appointed subchanter, organist, lay-vicar and master of the choristers of the cathedral. In 1755 he published his first work, *Twelve Songs*, which became at once highly popular. His next publication, *Six Sonatas for the Harpsichord*, was a failure. His third work, *Six Elegies for three voices*, preceded by an Invocation, with an Accompaniment, placed him among the first composers of his day. His fourth work was another set of *Twelve Songs*, now very scarce; and his fifth work was again a set of *Twelve Songs*, all of which are now forgotten. He next published *Twelve Hymns*, with some good remarks upon that style of composition, although his precepts were better than his practice. A set of *Twelve Songs* followed, containing some good compositions. Next came an Ode to Fancy, the words by Dr Warton. * Twelve Canzonets for two voices* formed his ninth work; and one of them—"Time has not thinned my Flowing Hair"—long held a place at public and private concerts. His tenth work was *Eight Sonatas for the Harpsichord*, some of which were novel and pleasing. He composed three dramatic pieces,—*Lycidas* (1675), *The Lord of the Manor*, to General Burgoyne's words (1780), and *The Metamorphoses*, a comic opera produced at Drury Lane in 1783, which did not succeed. In the second of these dramatic works, two airs—"Encamped in an Angel's Form" and "When first this Humble Roof I knew"—were great favourites. His church music was published after his death by James Paddon (1820); the *Critical and Popular Sonatas* and *Keyboard Essays* were also published. In 1782 he published *Thirty Letters on Various Subjects*, in which he severely attacked canons, and described William Bird's *Non nobis Domine* as containing passages not to be endured. But his anger and contempt were most strongly expressed against catches of all kinds, which he denounced as barbarous. In 1791 he put forth a pamphlet, *Observations on the Present State of Music in London*, in which he found fault with everything and everybody. He published in 1798 *The Four Ages, together with Essays on Various Subjects,*—a work which gives a favourable idea of his character and of his literary acquirements. Jackson also cultivated a taste for landscape painting, and imitated, not unsuccessfully, the style of his friend Gainsborough. He died on the 5th of July 1803.

**JACKSON, W.**—**JACKSON**
Jackson—Jacksonville

convention (1861), the "Black and Tan Convention" (1868), and the constitutional convention of 1890, and in it Jefferson Davis made his last speech (1884). Jackson is the seat of Millsaps College, chartered in 1890 and opened in 1892 (under the control of the Methodist Episcopal Church, South), and having, in 1907-1908, 12 instructors and 297 students; of Belhaven College (non-sectarian, 1888), for girls; and of Jackson College (founded in 1878 at Natchez by the American Baptist Mission Society; in 1883 removed to Jackson), for negroes, which had 356 students in 1907-1908. The city is a market for cotton and farm products, and has a number of manufactories. In 1821 the site was designated as the seat of the state government, and early in the following year the town, named in honour of Andrew Jackson, was laid out. The legislature first met here in December 1822. It was not until 1840 that it was chartered as a city. During the Civil War Jackson was in the theatre of active campaigning. On the 14th of May 1863 Johnston who then held the city, was attacked on both sides by Sherman and McPherson with two corps of Grant's army, which, after a sharp engagement, drove the Confederates from the town. After the fall of Vicksburg Johnston concentrated his forces at Jackson, which had been evacuated by the Federal troops, and prepared to make a stand behind the intrenchments. On the 9th of July Sherman began an investment of the place, and during the succeeding week a sharp bombardment was carried on. In the night of the 16th Johnston, taking advantage of a lull in the Union lines, made an attempt to relieve the city. Sherman's army entered on the 17th and remained five days, burning a considerable part of the city and ravaging the surrounding country.

Jackson, a city and the county-seat of Madison county, Tennessee, U.S.A., situated on the Forked Deer river, about 85 m. N.E. of Memphis. Pop. (1890), 10,039; (1900), 14,511, of whom 6108 were negroes; (1910 census), 15,779. It is served by the Mobile & Ohio, the Nashville, Chattanooga & St. Louis and the Illinois Central railways. The state supreme court holds its sessions here for the western district of Tennessee. The city is the seat of Union University (co-educational), chartered in 1875 as Southwestern Baptist University, and conducted under that name at Jackson until 1907, when the present name was adopted. In 1907-1908 the university had 17 instructors and 160 students. At Jackson, also, are St. Mary's Academy (Roman Catholic); the Memphis Conference Female Institute (Methodist Episcopal, South, 1843), and Lane College (for negroes), under the control of the Colored Methodist Episcopal Church. Jackson is a market for cotton and farm products of the city. Shippensburg is the largest city, the product of the factory and of the surrounding country is also numerous manufactories and railway shops. The total output of the factory product in 1905 was $2,317,715. The municipality owns and operates the electric lighting plant and the water-works. There is in the city an electro-chalybeate well with therapeutic properties. Jackson was settled about 1820, incorporated as a town in 1823, chartered as a city in 1854, and in 1907 received a new charter by which the sale of intoxicating liquors is forever prohibited. After General Grant's advance into Tennessee in 1862 Jackson was fortified and became an important base of operations for the Federal army, Grant himself establishing his headquarters here in October.

Jacksonville, a city and the county-seat of Duval county, Florida, U.S.A., in the N.E. part of the state, on the left bank of the St. John's River, 14 m. from the Atlantic Ocean as the crow flies and about 27 m. by water. Pop. (1890), 17,201; (1900), 28,420, of whom 16,268 were negroes and 1166 foreign-born; (1910 census) 57,699; the city being the largest in the state. It is connected with the Southern, the Atlantic Coast, the Jacksonville, the Florida & Live-oaks, and the Jacksonville, the Florida & Live-oaks, and the Florida East Coast railways, and by several steamship lines. It is the largest railway centre in the state, and is popularly known as the Gate City of Florida. In appearance Jacksonville is very attractive. It has many handsome buildings, and its residential streets are shaded with live-oaks, water oaks and bitter-orange trees. Jacksonville is the seat of two schools for negroes, the Florida Baptist Academy and Cookman Institute (1872, Methodist Episcopal). Many winter visitors are annually attracted by the excellent climate, the mean temperature for the winter months being about 35° F. Among the places of interest in the vicinity is the large Florida ostrich farm. There are numerous municipal and other parks. The city owns and operates its electric-lighting plant and its water-works system. The capital invested in manufacturing increased from $1,857,844 in 1900 to $4,837,281 in 1905, or 160.4%, and the value of the factory product rose from $1,798,607 in 1900 to $5,340,264 in 1905, or 196.9%. Jacksonville is the most important distributing centre in Florida, and is a port of entry. In 1909 its foreign imports were valued at $513,439; its foreign exports at $2,507,373.

The site of Jacksonville was called Cow Ford (a version of the Indian name, Wacca Pilatka), from the excellent ford of the St John's River, over which the King's Road, a highway built by the English from St Augustine to the Georgia line. The first settlement was made in 1826. In 1822 a town was laid out here and was named in honour of General Andrew Jackson; in 1833 Jacksonville was incorporated. During the Civil War the city was thrice occupied by Federal troops. In 1888 there was an epidemic of yellow fever. On the 20th of May 1901 a fire destroyed nearly 150 blocks of buildings, constituting a fifth of the business part of the city, the total loss being more than $1,500,000; but within two years new buildings greater in number than those destroyed were constructed, and up to December 1909 about 9,000 building permits had been granted.

Jacksonville, a city and the county-seat of Morgan county, Illinois, U.S.A., on Mauvaistere Creek, about 33 m. W. of Springfield. Pop. (1890), 12,935; (1900), 15,078, of whom 1407 were foreign-born; (1910 census), 15,326. It is served by the Chicago, Burlington & Quincy, the Chicago & Alton, the Chicago, Peoria & St Louis and the Wabash railways. It is the seat of several educational and philanthropic institutions. Illinois College (Presbyterian), founded in 1829 through the efforts of the Rev. John Millot Ellis (1793-1853), a missionary of the American Home Missionary Society and of the so-called Yale Band (seven Yale graduates devoted to higher education in the Middle West), is one of the oldest colleges in the Central States. The Illinois Academy of United States (1838) and the Illinois Conservatory of Music (1871) were absorbed in 1903 by Illinois College, which then became co-educational. The college embraces, besides the collegiate department, Whipple Academy (a preparatory department), the Illinois Conservatory of Music and a School of Art, and in 1908-1909 had 21 instructors and 173 students. The Rev. Edward Beecher was the first president of the college (from 1838 to 1844), and among its prominent graduates have been Richard Yates, jun., the Rev. Thomas K. Beecher, Newton Bateman (1822-1897), superintendent of public instruction of Illinois from 1865 to 1875 and president of Knox College in 1875-1893, Bishop Theodore N. Morrison (b. 1850), Protestant Episcopal Bishop of Iowa after 1808, and William J. Bryan. The Illinois Woman's College (Methodist Episcopal; chartered in 1847 as the Illinois Conference Female Academy) received its present name in 1890. The State Central Hospital for the Insane (opened in 1851), the State School for the deaf (established in 1839, opened in 1845, and the first charitable institution of the state) and the State School for the Blind (opened in 1862) are also in Jacksonville. Morgan Lake and Duncan Park are pleasure resorts. The total value of the factory product in 1905 was $1,981,582, an increase of 17.7% since 1900. Jacksonville was laid out in 1825 as the county-seat of Morgan county, was named probably in honour of Andrew Jackson, and was incorporated as a town in 1840, chartered as a (mean low water), and by 1909 the work had been completed; further dredging to a 24 ft. depth between the navigable channel and pierhead lines was authorized in 1907 and completed by 1910.
JACOB—JACOB OF EDESSA

The narratives are full of much valuable evidence regarding marriage customs, pastoral life and duties, popular beliefs and traditions, and are evidently typical of what was currently retained. Their historical value has been variously estimated. The name existed long before the traditional date of Jacob, and the Egyptian phonetic equivalent of Jacob-El (cf. Isra-El, Ishma-el) appears to be the name of a district of central Palestine (or possibly east of Jordan) about 1500 B.C. But the stories in their present form are very much later. The close relation between Jacob and Aramaeans confirms the view that some of the tribes of Israel were partly of Aramaean origin; his entrance into Palestine from beyond the Jordan is parallel to Joshua's invasion at the head of the Israelites; and his previous journey from the south finds independent support in traditions of another distinct movement from this quarter. Consequentially, it would appear that these extremely elevated and richly developed narratives of Jacob-Israel embody, among a number of other features, a recollection of two distinct traditions of migration which became fused among the Israelites. See further GENESIS; JEWS.

JACOB, JOHN (1812–1858), Indian soldier and administrator, was born on the 11th of January 1812, educated at Acadiscombe, and entered the Bombay artillery in 1828. He served in the first Afghan War under Sir John Conne, and afterwards led his regiment into the second Afghan War, and in this campaign he distinguished himself at the battles of Meenawack and Umarkot; but it is as commander of the Sind Horse and political superintendent of Upper Sind that he was chiefly famous. He was the pacificator of the Sind frontier, reducing the tribes to quietude as much by his commanding personality as by his ubiquitous military measures. In 1853 he forecasted the Indian Mutiny, saying: "There is more danger to our Indian empire from the state of the Bengal army, from the feeling which there exists between the natives and the European, and thence, spreads throughout the length and breadth of the land, than from all other causes combined. Let government look to this; it is a serious and most important truth"; but he was only rebuked by Lord Dalhousie for his pains. He was a friend of Sir Charles Napier and Sir James Outram, and resembled them in his outspoken criticisms and independence of authority. He died at the early age of 46 of brain fever, brought on by excessive heat and overwork. The town of Jacobabad, which has the reputation of being the hottest place in India, is named after him.

See A. I. Shand, General John Jacob (1900).

JACOB BEN ASHER (1280–1340), codifier of Jewish law, was born in Germany and died in Toledo. A son of Asher ben Yehiel (q.v.), Jacob helped to re-introduce the older elaborate method of legal casuistry which had been overthrown by Maimonides (q.v.). The Asheri family suffered great privations but remained faithful in their devotion to the Talmud. Jacob ben Asher is known as the Ba'al ha-Turim (literally "Master of the Rows") from his chief work, the Turim or Rows (the title is derived from the four Turim or rows of jewels in the High Priest's breastplate). In this work Jacob ben Asher codified Rabbinic law on ethics and ritual, and it remained a standard work of reference until it was edited with a commentary by Joseph Qaro, who afterwards simplified the code into the more popular Shulhan Aruch. Jacob also wrote two commentaries on the Pentateuch.

See Graetz, History of the Jews (Eng. trans.), vol. iv. ch. iii.: Weiss, Dor dor we-dorashav, v. 119–123.

JACOB OF EDESSA, who ranks with Barhebræus as the most distinguished for scholarship among Syriac writers, was born at Ên-débbá in the province of Antioch, probably about a.d. 640. From the trustworthy account of his life by Barhebræus (Chron. Eccl. i. 280) we learn that he studied first at the famous monastery of Ken-neshré (on the left bank of the Euphrates, opposite Jerábis) and afterwards at Alexandria, which had of course been

1 For the symbols J, E, P, as regards the sources of the book of Genesis, see GENESIS; BIBLE: Old Test. Criticism.
2 Since it is some 300 m. from Haran to Gilead it is probable that Laban's home, only seven days' journey distant, was nearer Gilead than the current tradition allows (Gen. xxxii. 2 sqq.).

(1 A. C.)
for some time in the hands of the Moslems. On his return he was appointed bishop of Edessa by his friend Athanasius II. (of Balad), probably in 684, but held this office only for three or four years, as the clergy withstood his strict enforcement of the Church canons and he was not supported by Julian, the successor of Athanasius in the patriarchate. Accordingly, having in anger publicly burnt a copy of the canons in front of Julian's residence, Jacob retired to the monastery of Kaisis near Samosota, and from there to the monastery of Eusebho, where for eleven years he taught the Psalms and the reading of the Scriptures in Greek. But often when he again encountered opposition, this time from monks who hated the Greeks, and so proceeded to the great convent of Tell 'Addi or Teleced (? modern Tell-Nâdi, N. of Aleppo), where he spent nine years in revising and emending the Peshitta version of the Old Testament by the help of various Greek versions. He was finally recalled to the bishopric of Edessa in 708, but died four months later, on the 5th of June.

In doctrine Jacob was undoubtedly Monophysite. Of the very large number of his works, which are mostly in prose, not many have as yet been published, but much information may be gathered from Assemani's Bibliotheca Orientalis and Wright's Catalogue of Syriac MSS. in the British Museum. (1) Of the Syriac Old Testament, Jacob produced a critical or patchwork, or a cursory editio princeps, of which five volumes survive in Europe (Wright's Catalogue 38). It was the first attempt at a revision of the Old Testament in the Monophysite Church. Jacob was also the founder of the Syriac Church Press, and the first to translate the New Testament into Syriac MSS, as the one (Vat. cl. iii.) described by Wiseman in Horæ syriacæ, part iii. (2) Jacob was also the author both of commentaries and of a schola on the sacred books; of these specimens are given by Assemani and Wright, and many others are quoted by later commentators. They often refer to Jacob as "of the Scriptures." With the commentaries may be mentioned his Hexaemeron, or treatise on the six days of creation, MSS of which exist at Leiden and at Lyon, but his last work, and being left incomplete, was finished by his friend Gregorios Kaspar. Among his apocrypha, the History of the Rechabites composed by Zosimus was translated from Greek into Syriac by Jacob (Wright's Catalogue 128, and in Revue sémitique vi. 263, vii. 14, 150). (3) Mention has also been made by Kayser of Jacob's stichometry of ecclesiastical canons. In his letter to the priest Addai we possess a collection of canons from his pen, given in the form of answers to Addai's questions. These were edited by Lagarde in Religiae juris ecclesiasticae scriptores, 1887, p. 17, and by Lamy in Dissertation p. 85. Additional canons were given in Wright's Notulae syriacæ. The whole have been translated and expounded by Kayser, Die Canones Jacobs von Edessa (Leipzig, 1886). (4) Jacob made many contributions to Syriac lexicography, and his principal treatise is the close of this period. (Wright, p. 145 seq.). (5) To philosophical literature his chief original contribution was his Enchiridion, a treatise on philosophical terms (Wright's Catalogue 948). The translations of works of Aristotle which have been made by Jacob are the principal work of this period (Wright, Hist. p. 149; Duval, Littérature syriaque, pp. 255, 258). The treatise De causa omnium causarum, which was the work of a bishop of Edessa, was formerly ascribed to Jacob, but it is published in the whole by Kayser has made it clear that the treatise is of much later date. (6) An important historical work by Jacob—a Chronicle in continuation of that of Eusebius—has unfortunately perished all except a few leaves. Of these a full account is given in Wright's Catalogue 1062. (7) Jacob's works on Syriac orthography (published by Phillips in London 1869, and by Martin in Paris the same year) he sets forth the importance of fidelity by scribes in the copying of miniatiae of spelling. In his grammar (of which only some fragments remain), while expressing his sense of the disadvantage under which Syriac labours through its alphabet containing only consonants, he declined to introduce a new and artificial system of writing, and contributed to the neglect and loss of the older books written without vowels. At the same time he invented, by adaptation of the Greek vowels, such a system of signs as might serve for purposes of grammatical usage, and was the first to introduce into Syriac a system of signs to indicate vowels. He also systematized and extended the use of diacritical points. It is still a moot question how far Jacob is to be regarded as the author of the first vowel-signs derived from, and used with, Greek letters. (8) In philosophical literature and in Syriac lexicography, Jacob is still the most important contribution to Syriac grammar down to the time of Barhebræus. (9) A translator of Jacob's greatest achievement was his Syriac version of the Hortulanus et historiarum of Severus of Antioch (512-515, 555-556). This important collection is now in part known to us by E. W. Brooks's edition and translation of the 6th book of selected epitomes of Severus, according to another Syriac version made by Anathanasii of Nisibis in 669. (10) A large number of letters is Jacob's correspondence and has been found in various MSS. Besides those on the canon law to Addai, and on grammar to George of Serrug referred to above, there are others dealing with doctrine, liturgy, &c., a few are in verse. Jacob impresses the modern reader mainly as an educator of his countrymen, and particularly of the clergy. His writings lack the fervid rhetoric and graceful style of such authors as Isaac of Antioch, Jacob of Serrug and Philoxenus of Mabbug. But judged by the standard of his time, the shows the qualities of a truly scientific theologian and scholar.

JACOB OF JÜTERBOG—JACOB OF SÉRUGH

Benedict Stolzenhagen, known in religion as Jacob, was born at Jüterbog in Brandenburg of poor peasant stock. He became a Cistercian monk in the monastery of Paradise in Poland, of which he was sent by the abbot to the university of Cracow, where he became master in philosophy and doctor of theology. He returned to his monastery, of which he became abbot. In 1441, however, discontented with the absence of strict discipline in his community, he obtained the leave of the papal legate at the council of Basel to transfer himself to the Carthusians, entering the monastery of Salvatorberg near Erfurt, of which he became prior. He lectured on theology at the university of Erfurt, of which he was rector in 1455. He died on the 30th of April 1465.

Jacob's main preoccupation was the reform of monastic life, the grave disorders of which he deplored, and to this end he wrote his Petitiones regiæorum pro reformatione sui statut. Another work, De negligentiæ prælatorum, was directed against the neglect of their office in practice, and the neglect of the monastic form of life. The reform of the church (Ad sensum pro reformatione ecclesiae) to Pope Nicholas V. This having no effect, he issued the most outspoken of his works, De septem ecclesiæ statibus, in which he reviewed the work of the Reformers and of the Council of Constance, and asking the question of doctrine, championed a drastic reform of life and practice of the church on the lines laid down at Constance and Basel. His principal works are collected in Walsh, Monumenta med. aevi i. (1757, 1771), and Engelbert Kibbelt, Vetus bibliotheca eccles. (Freiburg-im-Breisgau, 1750).

JACOB OF SÉRUGH, one of the best Syriac authors, named by one of his biographers the flute of the Holy Spirit and the harp of the believing church, was born in 451 at Kurram, a village on the margin of the plain of Harran, and was probably educated at Edessa. At an early age he rejected his countrymen by his piety and his literary gifts, and entered on the composition of the long series of metrical homilies on religious themes which formed the great work of his life. Having been ordained to the priesthood, he became periodeutes or episcopal visitor of Haurâ, in Serrug, not far from his birthplace. His tenure of this office extended over a long interval that brought the Christian population of Mesopotamia, due to the fierce war which was carried on by Kavadh II. of Persia within the Roman borders. When on the 10th of January 530 Amyd was captured by the Persians after a three months' siege and all its citizens put to the sword or carried captive, a panic seized the whole district, and the Christian inhabitants of many neighbouring cities planned

1 An affirmative answer is given by Wiseman (Horæ syriæ, pp. 181-188) and Wright (Catalogue 1168; Fragment of the Syriac Grammar of Jacob of Edessa, preface; Short Hist, p. 131 seq.). But Martin (In Joræ, As.; May—June 1869, pp. 435 seq.), Duval (Grammaire syriaque, p. 71) and Merx (op. cit. p. 30) are of the opposite opinion. The date of the introduction of the seven Nestorian vowel-signs is also uncertain.
to leave their homes and flee to the west of the Euphrates. They were recalled to a more courageous frame of mind by the letters of Jacob. 1 In 510, at the age of 68, Jacob was made bishop of Bârûn, another town in the district of Seûrûh, but only lived till November 512.

From the various extant accounts of Jacob's life and from the number of his known works, we gather that his literary activity was unceasing. According to Barkebraeus (Chron. Eccles. i. 191) he employed 70 amanuenses and wrote in all 760 metrical homilies, besides psalms, hymns and hymns of different sorts. Of his merits as a writer and poet we are now well able to judge from P. Bedjan's excellent edition of selected metrical homilies, of which four volumes have already appeared (Paris 1905-1908), containing 146 pieces. These are written throughout in decasyllabic measure as those published mainly with biblical themes, though there are also poems on such subjects as the deaths of Christian martyrs, the fall of the idols, the council of Nicaea, &c. 2 Of Jacob's prose works, which are nearly so numerous, the most interesting are his letters, which throw light upon some of the events of his time and reveal his attachment to the Monophysite doctrine which was then struggling for supremacy in the Syrian churches, and particularly at Edessa, over the opposite teaching of Nestorius. 3 (N. M.)

JACOBA, or Jacobeline (1401-1430), countess of Holland, was the only daughter and heiress of William, duke of Bavaria and count of Holland, Zeeland and Hainaut. She was married as a child to John, duke of Touraine, second son of Charles VI., king of France, who on the death of his elder brother Louis became dauphin. John of Touraine died in April 1417, and two months afterwards Jacoba lost her father. Acknowledged as sovereign in Holland and Zeeland, Jacoba was opposed by her uncle John of Bavaria, bishop of Liége. She had the support of the Hook faction in Holland. Meanwhile she had been married in 1418 by her uncle, John the Fearless, duke of Burgundy, to her cousin John IV., duke of Brabant. By the mediation of John the Fearless, a treaty of partition was concluded in 1419 between Jacoba and John of Bavaria; but it was merely a truce, and the contest between uncle and niece soon began again and continued with varying success. In 1420 Jacoba fled to England, and there, declaring that her marriage with John of Brabant was illegal, she contracted a marriage with Humphrey, duke of Gloucester, in 1422. Two years later Jacoba, with Humphrey, invaded Holland, where she was now opposed by her former husband, John of Brabant, John of Bavaria having died of poison. In 1425 Humphrey deserted his wife, who found herself obliged to seek refuge with her cousin, Philip V., duke of Burgundy, to whom she had to submit, and she was imprisoned in the castle of Ghent. John of Brabant now mortgaged the county of Holland and Zeeland to Philip, who was then their protectorate. Jacoba, however, escaped from prison in disguise, and for three years struggled gallantly to maintain herself in Holland against the united efforts of Philip of Burgundy and John of Brabant, and met at first with success. The death of the weak John of Brabant (April 1427) freed the countess from her quondam husband; but nevertheless the pope pronounced Jacoba's marriage with Humphrey illegal, and Philip, putting out his full strength, broke down all opposition. By a treaty, made in July 1428, Jacoba was left nominally countess, but Philip was to administer the government of Holland, Zeeland and Hainaut, and was declared heir in case Jacoba should die without children. Two years later Philip mortgaged Holland and Zeeland to the Borselen family, of which Francis, lord of Borselen, was the head. Jacoba now made her last effort. In 1432 she secretly married Francis of Borselen, and endeavoured to foment a rising in Holland against the Burgundian rule. Philip invaded the country, however, and threw Borselen into prison. Only on condition that Jacoba abdicated her three countships in his favour would he allow her liberty and recognize her marriage with Borselen.

1 See the contemporary Chronicle called that of Joshua the Styliste, chap. 51.
2 Asseman (Bibl. Orient. i. 305-339) enumerates 251 which he had seen in MSS.
3 Some other historical poems M. Bedjan has not seen fit to publish, on account of their unreliable and legendary character (vol. i. p. ix. of preface).

A full list of the older editions of works by Jacob is given by Wright in Short History of Syrian Literature, pp. 68-72.

She submitted in April 1432, retained her title of duchess in Bavaria, and lived on her husband's estates in retirement. She died on the 9th of October 1436, leaving no children.

JACOBAAD, a town of British India, the administrative headquarters of the Upper Sind frontier district in Bombay; with a station on the Quetta branch of the North-Western railway, 37 m. from the junction at Ruk, on the main line. Pop. (1901), 10,787. It is famous as having consistently the highest temperature in India. During the month of June the thermometer ranges between 120° and 127° F. The town was founded on the site of the village of Khangar in 1847 by General John Jacob, for many years commandant of the Sind Horse, who died here in 1858. It has cantonments for a cavalry regiment, with accommodation for caravans from Central Asia. It is watered by two canals. An annual horse show is held in January.

JACOBEAN STYLE, the name given to the second phase of the early Renaissance architecture in England, following the Elizabethan style. Although the term is generally employed of the style which prevailed in England during the first quarter of the 17th century, its peculiar decadent detail will be found nearly twenty years earlier at Wollaton Hall, Nottinghamshire, and in Oxford and Cambridge examples exist up to 1660, notwithstanding the introduction of the purer Italian style by Inigo Jones in 1619 at Whitehall. Already during Queen Elizabeth's reign reproductions of the classic orders had found their way into English architecture, based frequently upon John Shute's The First and Chief Grounds of Architecture, published in 1593, with two other editions in 1579 and 1584. In 1577, three years before the commencement of Wollaton Hall, a copybook of the orders was brought out in Antwerp by Jan Vredeman de Vries. Though nominally based on the description of the orders by Vitruvius, the author indulged freely not only in his rendering of them, but in suggestions of his own, showing how the orders might be employed in various buildings. Those suggestions were of a most decadent type, so that even the author deemed it advisable to publish a letter from a canon of the Church, stating that there was nothing in his architectural designs which was contrary to religion. It is to publications of this kind that Jacobean architecture owes the perversion of its forms and the introduction of strap work and pierced crestings, which appear for the first time at Wollaton (1580); at Bramshill, Hampshire (1607-1612), and in Holland House, Kensington (1624), it receives its fullest development.

(R. P. S.)

JACOBI, FRIEDRICH HENRICH (1743-1819), German philosopher, was born at Düsseldorf on the 23th of January 1743. The second son of a wealthy sugar merchant near Düsseldorf, he was educated for a commercial career. Of a retiring, meditative disposition, Jacobi associated himself at Geneva mainly with the literary and scientific circle of which the most prominent member was Lesage. He studied closely the works of Charles Bonnet, and the political ideas of Rousseau and Voltai.re. In 1765 he was called back to Düsseldorf, and in the following year he married a lady and took over the management of his father's business. After a short period he gave up his commercial career, and in 1770 became a member of the council for the duchies of Jülich and Berg, in which capacity he distinguished himself by his ability in financial affairs, and his zeal in social reform. Jacobi kept up his interest in literary and philosophic matters by an extensive correspondence, and his mansion at Pempelfort, near Düsseldorf, was the centre of a distinguished literary circle. With C. M. Wieland he helped to found a new literary journal, Der Teutsche Mercur, in which some of his earliest writings, mainly on practical or economic subjects, were published. Here too appeared in part the first of his philosophic works, Edward Allevis Brieffsammlung (1776), a combination of romance and speculation. This was followed in 1779 by Woldemar, a philosophic novel, of very imperfect structure, but full of genial
ideas, and giving the most complete picture of Jacobi's method of philosophizing. In 1779 he visited Munich as member of the privy council, but after a short stay there differences with his colleagues and with the authorities of Bavaria drove him back to Pempelfort. A few unimportant tracts on questions of theoretical politics were followed in 1785 by the work which first brought Jacobi into prominence as a philosopher. A conversation which he had held with Lessing in 1780, in which Lessing avowed that he knew no philosophy, in the true sense of that word, save Spinozism, led him to a protracted study of Spinoza's works. The Briefe über die Lehre Spinozas (1785; 2nd ed., much enlarged and with important Appendices, 1789) expressed sharply and clearly Jacobi's strenuous objection to a dogmatic system in philosophy, and drew upon him the vigorous enmity of the Berlin clique, led by Moses Mendelssohn. Jacobi was ridiculed as endeavouring to reintroduce into philosophy the antiquated notion of unreasoning belief, was denounced as an enemy of reason, as a pietist, and as in all probability a Jesuit in disguise, and was especially attacked for his use of the ambiguous term "belief." Jacobi's next important work, David Hume über den Glauben, oder Idealismus und Realismus (1787), was an attempt to show not only that the term Glaube had been used by the most enlightened authors so far as he could, but that the essence of all philosophical questions is an appeal of facts as opposed to the construction of inferences could not be otherwise expressed. In this writing, and especially in the Appendices, Jacobi came into contact with the critical philosophy, and subjected the Kantian view of knowledge to searching examination.

The outbreak of the war with the French republic induced Jacobi in 1793 to leave his home near Düsseldorf, and for nearly ten years he resided in Holstein. While there he became intimately acquainted with Reinhold (in whose Beiträge, pt. iii., 1801, his important work Übers das Unternehmen des Kritizismus, die Vernunft zu Verstände zu bringen was first published), and with Matthias Claudius, the editor of the Wandesberger Bote. During the same period the excitement caused by the accusation of atheism brought about against Fichte at Jena led to the publication of Jacobi's Letter to Fichte (1799), in which he made more precise the relation of his own philosophical principles to theology. Soon after his return to Germany, Jacobi received a call to Munich in connexion with the new academy of sciences just founded there. The loss of a considerable portion of his fortune induced him to accept this offer. The leading idea of the work, Marci Philippus, 1802, and in 1807 became president of the academy. In 1811 appeared his last philosophic work, directed against Schelling specially (Von den gotthlichen Dingen und ihrer Offenbarung), the first part of which, a review of the Wandesberger Bote, had been written in 1798. A bitter reply from Schelling was left without answer by Jacobi, but gave rise to an animated controversy in which Fries and Baader took prominent part. In 1812 Jacobi retired from the office of president, and began to prepare a collected edition of his works. He died before this was completed, on the 20th of March 1819. The edition of his writings was continued by his friend F. Kappen, and was completed in 1825. The works fill six volumes, of which the fourth is in three parts. To the second is prefixed an introduction by Jacobi, which is at the same time an introduction to his philosophy. The fourth volume has also a brief foreword.

The philosophy of Jacobi is essentially unsystematic. A certain fundamental view which underlies all his thinking is brought to bear in succession upon those systematic doctrines which appear to stand most sharply in contradiction to it, and any positive philosophic results are given only occasionally. The leading idea of Jacobi is that of the complete separation between understanding and apprehension of real fact. For Jacobi understanding, or the logical faculty, is purely formal or elaborative, and its results never transcend the given material supplied to it. From the basis of immediate experience or perception thought proceeds by comparison and abstraction, establishing connexions among facts, but remaining in its nature mediate and finite. The principle of reason and consequent, the necessity of thinking each given fact of perception as conditioned, impels understanding towards an endless series of identical propositions, the records of successive comparisons and abstractions. The province of the understanding is therefore strictly the region of the conditioned; to it the world must present itself as a mechanism. If, then, there is objective truth at all, the existence of real facts must be made known to us otherwise than through the logical faculty of thought; and, as the negation from conclusion to premises must depend upon something not itself capable of logical grounding, mediator thought implies the consciousness of immediate truth. Philosophy therefore must resign the hopeless ideal of a systematic (i.e., intelligible) explanation of things, and must content itself with the general statement of the facts, a mode of belief which has descended from the prejudice of philosophical thinkers, a prejudice which has descended from Aristotle, that mediate or demonstrated cognition is superior in cogency and value to the immediate perception of truths and facts.

As Jacobi starts with the doctrine that thought is partial and limited, applicable only to connect facts, but incapable of explaining their existence, it is evident that for him any demonstrative system of things is possible, which is in accordance with the principle of logical ground must be repulsive. Now in modern philosophy the first and greatest demonstrative system of metaphysics is that of Spinoza, and it lay in the nature of things that upon Spinoza's system Jacobi should first direct his criticism. A summary of the results of his examination is thus presented (Werke, i. 216-223): (1) Spinozism is atheism; (2) the Kabbalistic philosophy, so far as it is philosophy, is nothing but undeveloped or confused Spinozism; (3) the philosophy of Leibnitz and Wolff is not less false, and further that even Kantian and Fichtian views of some very principles of Spinoza; (4) every demonstrative method ends in fatalism; (5) we can demonstrate only similarities (agreements, truths conditionally necessary), proceeding always in identical reasoning and proof. Even the peculiar character of all human knowledge is that of belief (Glaube). Of these propositions only the first and fourth require further notice. Jacobi, accepting the law of reason and consequent as the fundamental rule of demonstrative reasoning, would introduce that, by means of which we proceed by applying this principle so as to recede from particular and qualified facts to the more general and abstract conditions, we land ourselves, not in the notion of an active, intelligent creator of systems, but in the notion of an all-comprehensive, indeterminate Nature. Our unconditioned is either a pure abstraction, or else the impossible notion of a completed system of conditions. In either case the result is atheism, and this result is necessary if the demonstrative method, the method of understanding, is regarded as the only possible means of knowledge. Moreover, the same method inevitably lands in fatalism. For, if the action of the human will is to be intelligible to understanding, it must be thought as a conditioned phenomenon, and its adequate conditions, as the impossibility of the event in ultimate abstraction, as the outflow from nature which is the sum of conditions. But this is the fatalistic conception, and any philosophy which accepts the law of reason and consequent as the essence of understanding must come to the conclusion that there can be no God and no liberty. It is impossible that there should be a God, for if so he would of necessity be finite. But a finite God, a God that is known, is no God. It is impossible that there should be liberty, for if so the mechanical order of phenomena, by means by which they are comprehensible, would be disturbed, and we should have an unlivable world, coupled with the requirement that it shall be understood. Cognition, then, in the strict sense, occupies the middle place between sense perception, which is belief in matters of sense and reason, which is belief in superhuman facts.
JACOBI, K. G. J.—JACOBS

JACOBI, KARL GUSTAV JACOB (1804-1851), German mathematician, was born at Potsdam, of Jewish parentage, on the 10th of December 1804. He studied at Berlin University, where he obtained the degree of doctor of philosophy in 1825, his thesis being an analytical discussion of the theory of fractions. In 1827 he became extraordinary and in 1829 ordinary professor of mathematics at Königsberg, and this chair he filled till 1842, when he visited Italy for a few months to recruit his health. On his return he removed to Berlin, where he lived as a royal pensioner till his death, which occurred on the 18th of February 1851.

His investigations in elliptic functions, the theory of which he established on quite a new basis, and more particularly his development of the theta-function, as given in his great treatise Fundamenta nova theoriae functionum ellipticarum (Königsberg, 1829), and in later papers in Crelle’s Journal, constitute his grandest analytical work. He is known only to these are his researches in differential equations, notably the theory of the last multiplier, which is fully treated in his Vorlesungen über Dynamik, edited by R. F. A. Clebsch (Berlin, 1866). It was in analytical development that Jacobi’s peculiar power mainly lay, and he made many important contributions of this kind to other departments of mathematics, as a glance at the long list of papers that were published by him in Crelle’s Journal and elsewhere from 1826 onwards will sufficiently indicate. He was one of the early founders of the theory of determinants; in particular he invented the Jacobian determinant formed of the $n$ differential coefficients of $n$ given functions of $n$ independent variables, which now bears his name (Jacobian), and which has played an important part in many analytical applications. See also Abhandlungen in Crelle’s Journal. He published his papers on Abelian transcendent, and his investigations in the theory of numbers, in which latter department he mainly supplements the labours of K. F. Gauss. The planetary theory and other problems of dynamical astronomy, and the theory of harmonic functions and the theory of elliptic functions, were his chief interests from time to time. He left a vast store of manuscript, portions of which have been published at intervals in Crelle’s Journal. His other works include Commentatio de transformatione integrals dupliss in formam simpliciorem (1830), Ecrits arithmetiques (1839), and Opuscula mathematica (1846–1857). His Gesammette Werke (1881-1891) were published by the Berlin Academy.

See Lejeune-Dirichlet, “Gedächtnissrede auf Jacobi” in the Abhandlungen der Berliner Akademie (1852).

JACOBS, THE, the most famous of the political clubs of the French Revolution. It had its origin in the Club Breton, which was established at Versailles shortly after the opening of the States General in 1789. It was at first composed exclusively of deputies from Brittany, but was soon joined by others from various parts of France, and counted among its early members Mirabeau, Steyès, Barnave, Pétion, the Abbé Grégoire, Charles and Alexandre Lameth, Robespierre, the duc d’Aiguillon, and La Revellière-Lépeaux. At this time its meetings were secret and little is known of what took place at them. After the émeute of the 5th and 6th of October the club, still entirely composed of deputies, followed the National Assembly to Paris, where it rented the refteratory of the monastery of the Jacobins in the Rue St Honoré, near the seat of the Assembly. The name “Jacobins,” given in France to the Dominicans, because their first house in Paris was in the Rue St Jacques, was first applied to the club in ridicule by its enemies. The title assumed by the club itself, after the promulgation of the constitution of 1791, was Société des amis de la constitution établis aux Jacobins à Paris, which was changed on the 21st of September 1792, after the fall of the monastery, to Société des Jacobins, amis de la liberté et de l’égalité. It occupied successively the refectory, the library, and the chapel of the monastery.

Once transferred to Paris, the club underwent rapid modifications. The first step was its expansion by the admission as members or associates of others besides deputies; Arthur Young was so admitted on the 18th of January 1790. On the 8th of February the society was formally constituted on this broader basis also by the adoption of the rules drawn up by Barnave, which were issued with the signature of the duc d’Aiguillon, the president. The objects of the club were defined as (1) to discuss in advance questions to be decided by the National Assembly; (2) to work for the establishment and strengthening of the constitution in accordance with the spirit of the preamble (i.e. of respect for legally constituted authority and the rights of man); (3) to correspond with other societies of the same kind which should be formed in the realm. At the same time the rules of order and forms of election were settled, and the constitution of the club came to be regarded as the Supreme National Assembly, with four secretaries, a treasurer, and committees elected to superintend elections and presentations, the correspondence, and the administration of the club. Any member who by word or action showed that his principles were contrary to the constitution and the rights of man was to be expelled, a rule which later on facilitated the “purification” of the society by the expulsion of its more moderate elements. By the 7th article the club decided to admit as associates similar societies in other parts of France and to maintain with them a regular correspondence.

This last provision was of far-reaching importance. By the 10th of August 1790 there were already one hundred and fifty-two affiliated clubs; the attempts at counter-revolution led to a great increase of their number in the spring of 1791, and by the close of the year the Jacobins had a network of branches all over France. It was this widespread yet highly centralized organization that gave to the Jacobin Club its formidable power.

At the outset the Jacobin Club was not distinguished by extreme political views. The somewhat high subscription could not have been expected to attract the mass of the people. It was so far as the central society in Paris was concerned—composed almost entirely of professional men, such as Robespierre, or well-to-do bourgeois, like Santerre. From the first, however, other elements were present. Besides Louis Philippe, duc de Chartres (afterwards king of the French), liberal aristocrats of the type of the duc d’Aiguillon, the prince de Broglie, or the vicomte de Noailles, and the bourgeoise who formed the mass of the members, the club contained such figures as “Père” Michel Gérard, a peasant proprietor from Tuel-en-Montgermont, in Brittany, whose rough common sense was admired as the oracle of popular wisdom, and whose countryman’s waistcoat and plaited hair were later on to become the model for the Jacobin fashion. The provincial branches were from the first far more democratic, though in these too the leadership was usually in the hands of members of the educated or propertied classes. Up to the very eve of the republic, the club ostensibly supported the monarchy; it took no part in the petition of the 17th of July 1790 for the king’s dethronement; nor had it any official share even in the insurrections of the 20th of June and the 10th of August 1792; it only formally recognized the republic on the 21st of September. But the character and extent of the club’s influence cannot be gauged by its official acts alone, and long before it emerged as the principal focus of the Terror, its character had been profoundly changed by the succession of its more moderate elements, some to found the Club of 1789, some in 1794—among them Barnave, the Lameths, Duport and Bailly—

“1 When I first sat among you I heard so many beautiful speeches that I might have believed myself in heaven, had there not been so many lawyers present.” Instead of practical questions “we have become involved in a gaminetas of Rights of Man of which I understand mighty little but that it is worth nothing.” Motion du Père Gérard in the Jacobins of the 27th of April 1790 (Aulard i. 63).
to found the club of the Feuillants scoffed at by their former friends as the club monarchique. The main cause of this change was the admission of the public to the sittings of the club, which began on the 14th of October 1792. The result is described in a report of the Department of Paris on "the state of the empire," presented on the 12th of June 1792, at the request of Roland, the minister of the interior, and signed by the duc de La Rochefoucauld, who ascribes to the Jacobins all the woes of the state. "There exists," it runs, "in the midst of the capital committed to our care a public pulpit of defamation, where citizens of every age and both sexes are admitted day by day to listen to a criminal propaganda. . . . This establishment, situated in the former house of the Jacobins, calls itself a society; but it has less the aspect of a private society than that of a public spectacle; vast tribunes are thrown open for the audience; all the sittings are advertised to the public for fixed days and hours, and the contents made are printed in a special journal and lavishly distributed." In this society—the report continues—murmur is counselled or applauded, all authorities are calumniated and all the organs of the law bespattered with abuse; as to its power, it exercises "by its influence, its affiliations and its correspondence a veritable ministerial authority, without title and without responsibility, while leaving to the legal and responsible authorities only the shadow of power" (Schmidt, Tableau, p. 3).

The constituency to which the club was henceforth responsible, and from which it derived its power, was in fact the peuple bête of Paris; the sans-culottes—decayed lackeys, cosmopolitan ne'er-do-wells, and starving workpeople—who crowded its tribunes. To this audience, and not primarily to the members of the club, the speeches of the orators were addressed and by its verdict were judged. In the earlier stages of the Revolution the mob had been satisfied with the fine platitudes of the philosophes and the vague promise of a political millennium; but as the chaos in the body politic grew, and with it the appalling material misery, it began to clamour for the blood of the "traitors" in office by whose corrupt machinations the millennium was delayed, and only those orators were listened to who panicked to its suspicions. Hence the elimination of the moderate elements from the club; hence the ascendency of Marat, and finally of Robespierre, the secret of whose power was that they really shared the suspicions of the populace, to which they gave a voice and which they did not shrink from translating into action. After the fall of the monarchy Robespierre, to effect the Jacobin Club, for to the tribunes he was the oracle of political wisdom, and by his standard all others were judged. With his fall the Jacobins too came to an end.

Not the least singular thing about the Jacobins is the very slender material basis on which their overwhelming power rested. France groaned under their tyranny, which was compared to that of the Inquisition, with its system of espionage and denunciations which no one was too illustrous or too humble to escape. Yet it was reckoned by competent observers that, at the height of the Terror, the Jacobins could not command a force of more than 3000 men in Paris. But the secret of their strength was that, in the midst of the general disorganization, they alone were organized. The police agent Dutard, in a report to the minister Garat (April 30, 1793), describing an episode in the Palais Égalité (Royal), adds: "Why did a dozen Jacobins strike terror into two or three hundred aristocrats? It is that the former have a rallying-point and that the latter have none." When the jeunesse dorée did at last organize themselves, they had little difficulty in flogging the Jacobins, and the club, the chief of the informal tribunals, and so this the Girondin government had been urged to meet organization by organization, by force; and it is clear from the daily reports of the police agents that even a moderate display of energy would have saved the National Convention from the humiliation of being dominated by a club, and the French Revolution from the blot of the "Terror." But though the Girondins were fully conscious of the evil, they were too timid, or too convinced of the ultimate triumph of their own persuasive eloquence, to act. In the session of the 30th of April 1793 a proposal was made to move the Convention to Versailles out of reach of the Jacobins, and Buzot declared that it was "impossible to remain in Paris" so long as "this abominable haunt" should exist; but the motion was not carried, and the Girondins remained to become the victims of the Jacobins.

Meanwhile other political clubs could only survive so long as they were content to be the shadows of the powerful organization of the Rue St Honoré. The Feuillants had been suppressed on the 18th of August 1792. The turn of the Cordeliers came so soon as its leaders showed signs of revolting against Jacobin supremacy, and no more startling proof of this ascendency could be found than the ease with which Hébert and his fellows were condemned and the readiness with which the Cordeliers, after a feeble attempt at protest, acquiesced in the verdict. It is idle to speculate on what might have happened had this ascendency been overthrown by the action of a strong government. No strong government existed, nor, in the actual condition of the country, was there likely to be. Hence the Jacobins survived, in a somewhat subterranean fashion, emerging again in the club of the Panthéon, founded on the 25th of November 1795, and suppressed in the following February (see Babeuf; François Noël). The last attempt to reorganize them was the foundation of the Réunion d'amis de l'égalité et de la liberté, in July 1799, which had its headquarters in the Salle du Manège of the Tuileries, and was thus known as the Club du Manège. It was patronized by Barras, and some two hundred and fifty members of the two councils of the legislature were enrolled as members, including many notable ex-Jacobins. It published a newspaper called the Journal des Libres, proclaimed the apotheosis of Robespierre and Babeuf, and attacked the Directory as a royauté pentarchique. But public opinion was now preponderatingly moderate or royalist, and the club was violently attacked in the press and in the streets, the suspicions of the government were aroused; it had to change its meeting-place from the Tuileries to the Temple (Temple of Peace) in the Rue du Bac, and in August it was suppressed, after barely a month's existence. Its members reconverted themselves on the Directory by supporting Napoleon Bonaparte.

Long before the suppression of the Jacobin Club the name of "Jacobins" had been popularly applied to all promulgators of extreme revolutionary opinions. In this sense the word passed beyond the borders of France and long survived the Revolution. Canning's paper, The Anti-Jacobin, directed against the English Radicals, consecrated its use in England; and in the
The correspondence of Metternich and other leaders of the repressive policy which followed the second fall of Napoleon, "Jacobin" is the term commonly applied to anyone with liberal tendencies, even to so august a personage as the emperor Alexander I. of Russia.

The most important source of information for the history of the Jacobins is F. A. Aulard's La société des Jacobins, Recueils de documents (6 vols., Paris, 1889, &c.), where a critical bibliography will be found. This collection does not contain all the printed sources—notably the official Journal of the Club is omitted—but the sources, when not included, are indicated. The documents published are furnished with valuable explanatory notes. See also W. A. Schmidt, Tableaux de la révolution française (3 vols., Leipzig, 1867-1870), notably for the reports of the secret police, which throw much light on the actual working of the Jacobin propaganda.

W. A. P.

**JACOBITE CHURCH.** The name of "Jacobites" is first found in a synodal decree of Nicaea A.D. 787, and was invented by hostile Greeks for the Syrian Monophysite Church as founded, or rather restored, by Jacob or James Baradazes, who was ordained its bishop A.D. 541 or 543. The Monophysites, who like the Greeks knew themselves simply as the Orthodox, were grievously persecuted by the Emperor Justinian and the graceless patriarchs of Alexandria, because they rejected the decrees of the council of Chalcedon, in which they—not without good reason—saw nothing but a thinly veiled relapse into those opinions of Nestorius which the previous council of Ephesus had condemned.

James was born a little before A.D. 500 at Tella or Tela, 55 m. east of Edessa, of a priestly family, and entered the convent of Peshitta on Mount Isla. About 528 he went with a fellow-monk Sergius to Constantinople to plead the cause of his co-religionists with the empress Theodora, and lived there fifteen years. Justinian during those years imprisoned, deprived or exiled most of the recalcitrant clergy of Syria, Mesopotamia, Cilicia, Cappadocia, and the adjacent regions. Once ordained bishop of Edessa, with the connivance of Theodora, James, disguised as a ragged beggar (whence his name Baradazes, Syriac Baradâs, Arabic al-Baradâa), traversed these regions preaching, teaching and ordaining new clergy to the number, it is said, of 30,000. His later years were embittered by struggles with his own clergy, and he died in 578. His work, however, endured, and in the middle ages the Jacobite hierarchy numbered 150 archbishops and bishops under a patriarch and his maphrian (fertilizer) since 1080 has lived at Mosul and ordains the bishops. Monastery is common among them, but there are no nunns. Next to the Roman Uniates (whom they term Rassen or Venal) they most hate the Nestorian Syrians of Persia. In 1882, at the instance of the British government, the Turks began to recognize them as a separate organization.

See M. Klein, Jacobus Baradazes (Leiden, 1882); Assemani, Bibl. Off. ii. 62-9, 326 and 331; G. P. Badger, The Nestorians (London, 1852); Rubens Duval, La littérature syriaque (Paris, 1899); G. Krüger, Monophysitische Streitigkeiten (London, 1884), and Verfassung der Kirchen des Orients (Landshut, 1865); and G. Wright, History of Syriac literature (London, 1894).

**JACOBITES** (from Lat. Jacobus, James), the name given after the revolution of 1688 to the adherents, first of the exiled English king James II., then of his descendants, and after the extinction of the latter in 1807, of the descendants of Charles I., i.e. of the exiled house of Stuart.

The history of the Jacobites, culminating in the risings of 1715 and 1745, is part of the general history of England (q.v.), and especially of Scotland (q.v.), in which country they were comparatively more numerous and more active, while there was also a large number of Jacobites in Ireland. They were recruited largely, but not solely, from among the Roman Catholics, and the Protestants among them were often identical with the Non-Jurors. Owing to a variety of causes Jacobitism began to lose ground after the accession of George I., and the suppression of the result of 55 and the total failure of the rising of 1745 may be said to mark its end as a serious political force. In 1765 Horace Walpole said that "Jacobitism, the concealed mother of the latter (i.e. Toryism), was extinct," but as a sentiment it remained for some time longer, and may even be said to exist to-day. In 1750, during a strike of coal workers at Elswick, James III. was proclaimed king; in 1780 certain persons walked out of the Roman Catholic Church at Hexham when George III. was prayed for; and as late as 1784 a Jacobite rising was talked about. Northumberland was thus a Jacobite stronghold; and in Manchester, where in 1777 according to an American observer Jacobitism "is openly professed," a Jacobite rendezvous known as "John Shaw's Club" lasted from 1735 to 1812. North Wales was another Jacobite centre. The "Cycle of the White Rose"—the white rose being the badge of the Stuarts—formed members of the principal Welsh families around Wrexham, including the Williamses, and among them, in 1710, formed a Jacobite expedition which lingered among the great families of the Scottish highlands; the last person to suffer death as a Jacobite was Archibald Cameron, a son of Cameron of Lochiel, who was executed in 1753. Dr. Johnson's Jacobite sympathies are well known, and on the death of Victor Emmanuel I., the ex-king of Sardinia, in 1824, Lord Liverpool wrote to Canning saying "there are those who think that the ex-king was the lawful king of Great Britain." Until the accession of King Edward VII. finger-bowls were not placed upon the royal dinner-table, because in former times those who secretly sympathized with the Jacobites were in the habit of drinking to the king over the water. The romantic side of Jacobitism was stimulated by Sir Walter Scott's Waverley, and many Jacobite poems were written during the 19th century.

The chief collections of Jacobite poems are: Charles Mackay's Jacobite Songs and Ballads of Scotland, 1688-1746, with Appendix of Modern Jacobite Songs (1861); G. S. Macquoid's Jacobite Songs and Ballads (1888); and English Jacobite Ballads, edited by A. B. Grosart from the Townley manuscripts (1877).

Upon the death of Henry Stuart, Cardinal York, the last of Charles II.'s descendants, in 1807, the rightful occupant of the British throne according to legitimist principles was to be found among the descendants of Henrietta, daughter of Charles I., who married Philip II., duke of Orleans. Henrietta's daughter, Anne Marie (1669-1728), became the wife of Victor Amadeus II., duke of Savoy; afterwards king of Sardinia; her son was King Charles Emmanuel III., and her grandson Victor Amadeus III. The latter's son, King Victor Emmanuel I., left no sons, and his eldest daughter, Marie Beatrix, married Francis IV., duke of Modena,
JACOBS, C. F. W.—JACOBSEN

whose son Ferdinand (d. 1849) left an only daughter, Marie Thérèse (b. 1849). This lady, the wife of Prince Louis of Bavaria, was in 1910 the senior member of the Stuart family, and according to the legitimists the rightful sovereign of Great Britain and Ireland.

Table showing the succession to the crown of Great Britain and Ireland according to Jacobite principles.

Among the modern Jacobite, or legitimist, societies perhaps the most important is the "Order of the White Rose," which has a branch in Canada and the United States. The order holds that sovereignty is of divine sanction, and that the execution of Charles I. and the revolution of 1688 were national crimes; it exists to study the history of the Stuarts, to oppose all democratic tendencies, and in general to maintain the theory that kingship is independent of all parliamentary authority and popular approval. The order, which was instituted in 1886, was responsible for the Stuart exhibition of 1889, and has a newspaper, the "Royalist." Among other societies with similar objects in view are the "Thames Valley Legitimist Club" and the "Legitimist Jacobite League of Great Britain and Ireland." See Historical Papers relating to the Jacobite Period, edited by J. Allanby (Aberdeen, 1895-1899); (J. A. S. Reports, 1901-1871); and F. W. Head, The Fallen Stuarts (Cambridge, 1901). The marquis de Ruvigny has compiled The Jacobite Peerage (Edinburgh, 1904), a work which purports to give a list of all the titles and honours conferred by the kings of the exiled House of Stuart.

JACOBSEN, JENS PETER (1847-1885), Danish imaginative writer, was born at Thisted in Jutland, on the 7th of April 1847: he was the eldest of the five children of a prosperous merchant. He studied at Copenhagen, and in 1868 he was sent to the university of Jena. As a boy he showed a remarkable turn for science, particularly for botany. In 1870, although he was secretly writing verses already, Jacobsen definitely adopted botany as a profession. He was sent by a scientific body in Copenhagen to report on the flora of the islands of Anholt and Læsø. About this time the discoveries of Darwin began to exercise a fascination over him, and finding them little understood in Denmark, he translated into Danish The Origin of Species and The Descent of Man.
the autumn of 1872, while collecting plants in a morass near Ordrupt, he contracted pulmonary disease. His illness, which cut him off from scientific investigation, drove him to literature. He met the famous critic, Dr Georg Brandes, who was struck by his powers of expression, and under his influence, in the spring of 1873, Jacobsen began his great historical romance of *Marie Grubbe*. His method of composition was painful and elaborate, and his work was not ready for publication until the close of 1876. In 1879 he was too ill to write at all; but in 1880 an improvement came, and he finished his second novel, *Niels Lyhne*. In 1882 he published a volume of six short stories, most of them written a few years earlier, called, from the first of them, *Mogens*. After this he wrote no more, but lingered on in his mother's house at Thisted until the 30th of April 1885. In 1886 his posthumous fragments were collected. It was early recognized that Jacobsen was the greatest artist in prose that Denmark has produced. He has been compared with Flaubert, with De Quincey, with Pater; but these parallelisms merely express a sense of the intense individuality of his style, and of his untiring pursuit of beauty in colour, form and melody. Although he wrote so little, and crossed the living stage so hurriedly, his influence in the North has been great. His novel, *Lyhne*, which has never been translated into any language of the North or Norway has tried to write prose carefully since 1880 whose efforts have not been in some degree modified by the example of Jacobsen's laborious art.

His *Samlede Skrifter* appeared in two volumes in 1888; in 1899 his letters (Brøn) were edited by Edvard Brandes. In 1896 an English translation of part of the former was published under the title of *Seven Voices: Niels Lyhne*, by Miss E. F. L. Robertson. (E. G.)

**JACOB'S WELL**, the scene of the conversation between Jesus and the ”woman of Samaria” narrated in the Fourth Gospel, is described as being in the neighbourhood of an otherwise unmentioned ”city called Sychar.” From the time of Eusebius this city has been identified with Sychem or Shechem (modern Nablus), and the well is still in existence there. The town, at the foot of Mt Gerizim. It is beneath one of the ruined arches of a church mentioned by Jerome, and is reached by a few rough steps. When Robinson visited it in 1838 it was 105 ft. deep, but it is now much shallower and often dry.

For a discussion of Sychar as distinct from Shechem see T. K. Cheyne, art. ”Sychar,” in Ewyc. Bibl., col. 483. It is possible that Sychar should be placed at Tūlîl Balūtâ, a mound about ½ m. W. of the well (Palestine Exploration Fund Statement, 1907, p. 92 seq.); when that village fell into ruin the name may have migrated to Askar, a village on the lower slopes of Wâsâlî, some 6 m. N. from Nablus and ½ m. N. from Jacob's Well. It may be noted that the difficulty is not with the location of the well, but with the identification of Sychar.

**JACOBS DE VORAGINE** (c. 1230-c. 1298), Italian chronicler, archbishop of Genoa, was born at the little village of Varazze, near Genoa, about the year 1230. He entered the order of the friars preachers of St Dominic in 1244, and besides preaching with success in many parts of Italy, taught in the schools of his own fraternity. He was provincial of Lombardy from 1267 till 1286, when he was removed to the meeting of the order in Paris. He also represented his own province at the councils of Lucca (1252, 1265, 1269). On the last occasion he was one of the fourlegates charged with signing Nicholas IV.'s desire for the deposition of Munio de Zamora, who had been master of the order from 1285, and was deprived of his office by a papal bull dated the 12th of April 1291. In 1288 Nicholas empowered him to absolve the people of Genoa for their offence in aiding the Sicilians against Charles II. Early in 1292 the same pope, himself a Franciscan, summoned Jacobs to Rome, intending to consecrate him archbishop of Genoa with his own hands. He reached Rome on Palm Sunday (March 30), only to find his patron ill of a deadly sickness, from which he died on Good Friday (April 4). The Cardinals, however, "propter honorem Communis Januae," determined to carry out this consecration on the Sunday after Easter. He was a good bishop, and especially distinguished himself by his efforts to appease the civil discord of genoa. He died in 1295 or 1299, and was buried in the Dominican church at Genoa. A story, mentioned by the chronicler Echard as unworthy of credit, makes Boniface VIII, on the first day of Lent, cast the ashes in the archbishop's eyes instead of on his head, with the words, "Remember that thou art a Ghibelline, and with thy fellow Ghibellines wilt return to naught.”

Jacobus de Voragine left a list of his own works. Speaking of himself in his *Chronicon januense*, he says, "While he was in his order, and after he had been made archbishop, he wrote many works. For he compiled the legends of the saints (*Legenda sanctorum*) in order to add new things to the old, and so to add to the sum of knowledge and to reconcile. Then follow *Sermones de omnibus evangeliis dominicalibus* for every Sunday in the year; *Sermones de omnibus evangeliis*, i.e. a book of discourses on all the Gospels, from Ash Wednesday to the Tuesday after Easter; and *Gesta domini Magni* (1293), to have translated the Old and New Testaments into his own tongue. "But," adds Echard, "if he did so, the version lies so closely hid that there is no recollection of it, and it may be added that it is improbable that the man who compiled the Golden Legend ever conceived the necessity of having the Scriptures in the vernacular.

His two chief works are the *Chronicon januense* and the *Golden Legend* (in Latin, *Biblia Pauperum*, 1263, &c.). The former is partly printed in Latin (Scriptores Rerum, xli. ix. 6). It is divided into twelve parts. The first four deal with the mythical history of Genoa from the time of its founder, Janus, the first king of Italy, and its enlarger, a second Janus "citizen of Troy," till its conversion to Christianity about the year 1295. The author, instead of presenting the facts of the beginning, the growth and the perfection of the city; but of the first period the writer candidly confesses he knows nothing except by hearsay. The second period includes the Genoese crusading exploits in the East, and extends to their victory over the Pisans on the island of c. 1130, while the third reaches down to the days of the author's archbishopric. The sixth part deals with the constitution of the city, the seventh and eighth with the duties of rulers and citizens, the ninth with the domestic life, the tenth with the ecclesiastical, the history of Genoa from the time of its first known bishop, St. Januarius, whom we believe to have lived about 530 A.D., till 1133, when the city was raised to archiepiscopal rank. The eleventh contains the lives of the bishops of Genoa, and the twelfth deals with the chief events during their pontificates; the twelfth deals in the same way with the archbishops, not forgetting the writer himself.

The *Golden Legend*, one of the most popular religious works of the middle ages is a collection of the legendary lives of the greater saints of the medieval church. The preface divides the ecclesiastical year into four periods corresponding to the various epochs of the world's history, a time of creation, renovation, of reconciliation and of the millennium. The following are the four sections:— (a) from Advent to Christmas (cc. 1–5); (b) from Christmas to Septuagesima (6–30); (c) from Septuagesima to Easter (31–53); (d) from Easter Day to the octave of Pentecost (54–76); (e) from the octave of Pentecost to Advent (77–160). The saints' lives are full of pious instruction, and the third and fourth sections contain 13th-century miracles wrought at special places, particularly with reference to the Dominicans. The last chapter but one (181), "De Sancto Pelagio Papa," contains a kind of history of the world from the miracles of the sixth century, which is somewhat allegorical disguised, "De Dedicatione Ecclesiae,"

The *Golden Legend* was translated into French by Jean Bele de Vigny in the 14th century. It was also one of the earliest books known to have been translated into English; a manuscript translation of the Golden Legend was found in the library of the College of St. George at Venice (1475); a Bohemian one at Pilsen, 1475–1479, and at Prague, 1495; Caxton's English versions, 1483, 1487 and 1493; and a German one in 1489. Fifteen 15th-century editions of the *Sermones* are also known, and the *Mariele* was printed in Venice in 1497 and at Paris in 1503.

**JACOTOT, JOSEPH** (1770-1840), French educationist, author of the method of "emancipation intellectuelle," was born
JACQUARD—
and bravery the elected Polytechnic 122 several with maintained July several complete his ing.
and mathematics. Dijon views campaign at 1840. however, 1792, his father, Augustin
was suggested to and was perfecting the French language at the university of Louvain, where he perfected into a system the educational principles which he had already practised with success in France. His method was not only adopted in several institutions in Belgium, but also met with some approval in France, England, Germany and Russia. It was based on three principles: (1) all men have equal intelligence; (2) every man has received from God the faculty of being able to instruct himself; (3) everything is in everything. As regards (1) he maintained that it is only in the will to use their intelligence that men differ; and his own process, depending on (3), was to give any one learning a language for the first time a short passage of a few lines, and to encourage the pupil to study, first the words, then the letters, then the grammar, then the meaning, until a single paragraph became the occasion for learning an entire literature. After the revolution of 1830 Jacquot returned to France, and he died at Paris on the 30th of July 1840.

His system was described by him in Enseignement universel, langue maternelle, Louvain and Dijon, 1823—whch passed through several editions—of which he has given extracts in his views in the Journal de l'Émancipation intellectuelle. For a complete list of his works and fuller details regarding his career, see Biographie de J. Jacquot, by Achille Guillard (Paris, 1860).

JACQUARD, JOSEPH MARIE (1752–1834), French inventor, was born at Lyons on the 7th of July 1752. On the death of his father, who was a working weaver, he inherited two looms, with which he started business on his own account. He did not, however, prosper, and was at last forced to become a loom-burner at Bresse, while his wife supported herself at Lyons by plaiting straw. In 1793 he took part in the unsuccessful defence of Lyons against the troops of the Convention; but afterwards served in their ranks on the Rhône and Loire. After seeing some active service, in which his young son was shot down at his side, he again returned to Lyons. There he obtained a situation in a factory, and employed his spare time in constructing his improved loom, of which he had conceived the idea several years previously. In 1801 he exhibited his invention at the industrial exhibition at Paris; and in 1803 he was summoned to Paris and attached to the Conservatoire des Arts et Métiers. An loaf by Jacques de Vaucanson (1729–1798), deposited there, suggested various improvements in his own, which he gradually perfected to its final state. Although his invention was fiercely opposed by the silk-weavers, who feared that its introduction, owing to the saving of labour, would deprive them of their livelihood, its advantages secured its general adoption, and by 1812 there were 11,000 Jacquard looms in use in France. The loom was declared public property in 1866, and Jacquard was rewarded with a pension and a royalty on each machine. He died at Oullins (Rhône) on the 7th of August 1834, and six years later a statue was erected to him at Lyons (see Weaving).

JACQUARD, THE, an insurrection of the French peasantry which broke out in the Île de France and about Beauvais at the end of May 1758. The hardships endured by the peasants in the Hundred Years' War and their hatred for the nobles who oppressed them were the principal causes which led to the rising, though the immediate occasion was an affray which took place on the 28th of May at the village of Saint-Leu between "brigands" (militia armoury in brigandines) and country-folk. The latter having got the upper hand united with the inhabitants of the neighbouring villages and placed Guillaume Karle at their head. They destroyed numerous châteaux in the valleys of the Oise, the Brèche and the Thérain, where they subjected the whole countryside to fire and sword, committing the most terrible atrocities. Charles the Bad, king of Navarre, crushed the rebellion at the battle of Mello on the 10th of June, and the nobles then took violent reprisals upon the peasants, massacring them in great numbers.

See Simeon Luce, Histoire de la Jacquerie (Paris, 1839 and 1895).
forms and elaborately carved. On many prehistoric sites in Europe, as in the Swiss lake-dwellings, cells and other carved objects both in nephrite and in jadeite have not infrequently been found; and as no kind of jade had until recent years been discovered in situ in any European locality it was held, especially by Professor L. H. Fischer, of Freiburg im Breisgau, Baden, that either the raw material or the worked objects must have been brought by some of the early inhabitants from a jade locality probably in the East, or were obtained by barter, thus suggesting a very early trade-route to the Orient. Exceptional interest, therefore, attached to the discovery of jade in Europe, nephrite having been found in Silesia, and jadeite or a similar rock in the Alps, whilst pebbles of jade have been obtained from many localities in Austria and north Germany, in the latter case probably derived from Sweden. It is, therefore, no longer necessary to assign the old jade implements to an exotic origin.

Dr. A. B. Meyer, of Dresden, always maintained that the European jade objects were indigenous, and his views have become generally accepted. Now that the mineral character of jade is better understood, and its identification less uncertain, it may possibly be found with altered peridotites, or with amphibolites, among the old crystalline schists of many localities.

Nephrite, or true jade, may be regarded as a finely fibrous or compact variety of amphibole, referred either to actinolite or to tremolite, according as its colour inclines to green or white. Chemically it is a calcium magnesium silicate, CaMg3(SiO4)4, or, in the form of actinolite CaMg3(SiO4)(OH)2. It is more or less parallel or irregularly felted together, rendering the stone excessively tough; yet its hardness is not great, being only about 6 or 6-5. The mineral sometimes tends to become schistose, breaking on planes parallel to the stratification, and small rhombohedral crystals may be horny. The specific gravity varies from 2-9 to 3-18, and is of determinative value, since jadeite is much denser. The colour of jade presents various shades of green, yellow and grey, and the mineral when polished has a rather greasy, or, more frequently, a silky lustre. In some specimens from the jade country of Upper Burma after Noëting, jadeite occurs at three localities in the Kachin Hills—Tawmaw, Hwela and Mamon. The jadeite is known as chauk-sen, and is said to be given to the Chinese by the Burmese at the harvest time. It is said to be of very fine quality and has come erroneously to be regarded as a locality for jade. Jadeite is not associated with the nephrite of Turkestan, and possibly in some other Asiatic localities. In certain cases nephrite is formed by the alteration of jadeite, as shown by Professor J. F. Iddings. The Chinese jadete, or nephrite, is regarded as "bottle jade," whereas jadeite seems generally to be jadeite, but it is said that in some cases it may be chrysoprase. It is named from its resemblance in colour to the resemblance of the kingfisher. The resonant character of jade has been noticed on several occasions.

In Mexico, in Central America and in the northern part of South America, objects of jadeite are common. The Kunz novelette jade from Oaxaca, in Mexico, is now in the American Museum of Natural History, New York. At the time of the Spanish conquest of the Aztecs, jade, or jadeite, was used for hatchets or agricultural implements, whilst the sago-clubs of the island are usually of serpentine. Stalactite, or fibrolite, is a mineral which, like chloromelanite, was used by the Neolithic occupants of western Europe, into which it has been worked by ancient hands. It is an aluminium silicate, of specific gravity about 3-2, distinguished by its infusibility. The jade lance of J. R. Haüy, discovered by H. B. de Saussure in the Swiss Alps, is now known as saussurite. Another variety is the quartzitic jade or single jade, of which a fine, glassy, prehnite, a hydrous calcium-aluminium silicate, which when polished much resembles certain kinds of jade. Pelitite has been used, like jade, in Alaska. A variety of vesuvianite (diorous) from California, is described by Professor J. F. G. Merrill, as being a true jade. The name jadeoilet has been given by Kunz to a green chromiferous syenite from the jadeite mines of Burma. The mineral called bowenite, at one time supposed to be jade, is a hard and tough variety of serpentine, of green or yellowish colour, found in some metamorphic rocks. Imitations of jade are carved in steatite or serpentine, while others are merely glass. The pâte de verre is a fine white glass. The so-called "pink jade" is mostly quartz, artificially coloured, and "black jade," though sometimes mentioned, has no existence.

An exhaustive description of jade will be found in a sumptuous work, entitled Jades et Jades (New York, 1900). This work, edited by Dr. G. F. Kunz, was prepared in the illustration of the famous jade collection made by Heber Reginald Bishop, and
presented by him to the Metropolitan Museum of Art, New York. The work, which is in two folio volumes, superbly illustrated, was printed by hand, and on hand-made paper. The making of the book itself and the printing of the type were done in London. The important section on Chinese jade was contributed by Dr S. W. Bushell, who also translated for the work a discourse on jade—Yu-shou by T'ang Jung-tso, of Peking. Reference should also be made to the brilliant Fischer’s Nephrit und Jadeit (and sequel, 1888), a work which at the time of its publication was almost exhaustive.

(F. W. R.*)

JAEN, an inland province of southern Spain, formed in 1833 of districts belonging to Andalusia; bounded on the N. by Ciudad Real and Albacete, E. by Albacete and Granada, S. by Granada, and W. by Cordova. Pop. (1900), 474,409; area, 5848 sq. m. Jaen comprises the upper basin of the river Guadalquivir, which traverses the central districts from east to west, and is enclosed on the north, south, east by mountain ranges, while on the west it entered by the great Andalusian plain. The Sierra Morena, which divides Andalusia from New Castile, extends along the northern half of the province, its most prominent ridges being the Loma de Chichana and the Loma de Ubeda; the Sierra de Segura, in the east, derive their name from the river Segura which just within the borders, and between the last-named watershed, its continuation the Sierra del Pozo, and the parallel Sierra de Cazorla, is the source of the Guadalquivir. The loftiest summits in the province are those of the Sierra Magina (7103 ft.) farther west and south. Apart from the Guadalquivir the only large rivers are its right-hand tributaries the Jándula and Guadalimar, its left-hand tributary the Guadarranza, and the Segura, which flows east and south to the Mediterranean.

In a region which varies so markedly in the altitude of its surface, the climate is naturally unequal; and, while the bleak, wind-swept highlands are only available as sheep-walks, the well-watered and fertile valleys have been cultivated since Roman times, and mining is an important industry, with its centre at Linare. Over 400 lead mines were worked in 1903; small quantities of iron, copper and salt are also obtained. There is some trade in sawn timber and cloth; esparto fabrics, alcohol and oil are manufactured. The roads, partly owing to the development of mining, are more numerous and better kept than in most Spanish provinces. Railway communication is also very complete in the western district, and Jaen has a railway station. Jaen is connected by rail with Granada, and is joined south of Linare by two important railways—from Algeciras and Malaga on the south-west, and from Almeria on the south-east. The eastern half of Jaen is inaccessible by rail. In the western part of the province, with Andujar (16,302), Baeza (14,379), Baillen (7420), Linare (38,245), Martos (17,078) and Ubeda (19,913). Other towns of more than 7000 inhabitants are Alcalà la Raval, Alcaudete, Arizona, La Carolina and Porcuna, in the west; and Cazorla, Quesada, Arjonilla, Villacarrillo and Villanueva del Arzobispo, in the east.

JAEN, the capital of the Spanish province of Jaen, on the Linares-Puente Genil railway, 1500 ft. above the sea. Pop. (1900), 26,434. Jaen is finely situated on the well-watered northern slopes of the Jabalcuz Mountains, overlooking the picturesque valleys of the Jaen and Guadalbullón rivers, which flow north into the Guadalquivir. The hillside upon which the narrow and irregular city streets rise in terraces is fortified with Moorish walls and a Moorish citadel. Jaen is an episcopal see. Its cathedral was founded in 1532; and, although it remained unfinished until late in the 18th century, its main characteristics are those of the Renaissance period. The city contains many churches and convents, a library, art galleries, theatres, barracks and hospitals. Its manufactures include leather, soap, alcohol and linen; and it was formerly celebrated for its silk. There are hot mineral springs in the mountains, 2 m. south.

The identification of Jaen with the Roman Aurilus, which has sometimes been suggested, is extremely questionable. After the Moorish conquest Jaen was an important commercial centre, under the name of Jayyan; and ultimately became the capital of a petty kingdom, which was brought to an end only in 1246 by Ferdinand III. of Castile, who transferred the bishopric of Baeza in 1248. Ferdinand IV. died at Jaen in 1312. In 1712 the city suffered severely from an earthquake.

JAFARABAD, a state of India, in the Kathiawar agency of Bombay, forming part of the territory of the nawab of Janjun; area, 42 sq. m.; pop. (1901), 12,097; estimated revenue, £4000. The town of Jafarabad (pop. 6038), situated on the estuary of a river, carries on a large coasting trade.

JAFFNA, a town of Ceylon, at the northern extremity of the island. The fort was described by Sir J. Emerson Tennant as "the most perfect little military work in Ceylon—a pentagon built of blocks of white coral." The European part of the town bears the Dutch stamp more distinctly than any other town in Ceylon; and it has a Presbyterian church. Several of the church buildings date from the time of the Portuguese. In 1901 Jaffna had a population of 33,879, while in the district or peninsula of the same name there were 390,831 persons, nearly all Tamils, the only Europeans being the civil servants and a few planters. Coco-nut planting has not been successful of recent years. The natives grow palmyras freely, and have a trade in the fibre of this palm. They also grow and export tobacco, but not enough rice for their own requirements. A steamer calls weekly, and there is considerable trade. The railway extension from Kurunegala due north to Jaffna and the coast was commenced in 1900. Jaffna is the seat of a government agent and district judge, and criminal sessions of the supreme court are regularly held. Jaffna, or, as the natives call it, Yalpannan, was occupied by the Tamils about 204 B.C. and there continued to be Tamil rajahs of Jaffna till 1617, when the Portuguese took possession of the place. As early as 1544 the missionaries under Francis Xavier had made converts in this part of Ceylon, and after the conquest the Portuguese maintained their proselytizing zeal. They had a Jesuit college, a Dominican and a Dominican and anchorite, and a church in the Portuguese in 1653. The Church of England Missionary Society began its work in Jaffna in 1818, and the American Missionary Society in 1822.

JÄGER, GUSTAV (1832— ), German naturalist and hygienist, was born at Bürg in Württemberg on the 23rd of June 1832. After studying medicine at Tübingen he became a teacher of zoology at Vienna. In 1868 he was appointed professor of zoology at the academy of Hohenheim, and subsequently became teacher of zoology and anthropology at Stuttgart polytechnic and professor of physiology at the veterinary school. In 1884 he abandoned teaching and started practice as a physician in Stuttgart. He wrote various works on biological subjects, including Die Darwinische Theorie und ihre Stellung zu Moral und Religion (1869), Lehrbuch der allgemeinen Zoologie (1871—1878), and Die Entklopfung der Seele (1878). In 1876 he suggested an hypothesis in explanation of heredity, resembling the germplasm theory subsequently elaborated by August Weismann, to the effect that the germinal protoplasm retains its specific properties from generation to generation, dividing in each reproduction into an ontogenetic portion, out of which the individual is built up, and a phylogenetetic portion, which is reserved to form the reproductive material of the mature offspring. In Die Normaleibung als Gesundheitsschutz (1858) he advocated the system of clothing associated with his name, objecting especially to the use of any kind of vegetable fibre for clothes.

JÄGERDORF (Czech, Kromov), a town of Austria, in Silesia, 18 m. N.W. of Troppau by rail. Pop. (1900), 14,075, mostly German. It is situated on the Oppa and possesses a château belonging to Prince Liechtenstein, who holds extensive estates in the district. Jägerdorf has large manufactories of cloth, woolens, linen and machines, and carries on an active trade. On the neighbouring hill of Burgberg (1420 ft.) are a church, much visited as a place of pilgrimage, and the ruins of the seat of the former princes of Jägerdorf. The claim of Prussia to the principality of Jägerdorf was the occasion of the first Silesian war (1740—1742), but in the partition, which followed, Austria retained the larger portion of it. Jägerdorf suffered severely during the Thirty Years' War, and was the scene of engagements between the Prussians and Austrians in May 1745 and in January 1779.
JAGERSFONTEIN, a town in the Orange Free State, 50 m. N.W. by rail of Springfontein on the trunk line from Cape Town to Pretoria. Pop. (1904), 557—1283 whites and 4264 coloured persons. Jagersfontein, which occupies a pleasant situation on the open veld about 4200 ft. above the sea, owes its existence to the valuable diamond mine discovered here in 1870. The first diamond, a stone of 50 carats, was found in August of that year, and digging immediately began. The discovery a few weeks later of the much richer mines at Bultfontein and Du Toits Pan, followed by the great finds at De Beers and Colesberg Kop (Kimberley) caused Jagersfontein to be neglected for several years. Up to 1887 the claims in the mine were held by a large number of individuals, but coincident with the efforts to amalgamate the interest in the Kimberley mines a similar movement took place at Jagersfontein, and by 1893 all the claims became the property of one company, which has a working arrangement with the De Beers corporation. The mine, which is worked on the open system and has a depth of 450 ft., yields stones of very fine quality, but the annual output does not exceed in value £700,000. In 1900 a shaft 950 ft. deep was sunk with a view to working the mine on the underground system. Among the famous stones found in the mine are the “Excelsior” (weighing 951 carats, and larger than any previously discovered) and the “Jubilee” (see DIAMOND). The town was created a municipality in 1904.

Fourteen miles east of Jagersfontein is Boomplaats, the site of the battle fought in 1848 between the Boers under A. W. Pretorius and the British under Sir Harry Smith (see ORANGE FREE STATE: History).

JAGO, RICHARD (1715-1781), English poet, third son of Richard Jago, rector of Beaudesert, Warwickshire, was born in 1715. He went up to University College, Oxford, in 1732, and took his degree in 1736. He was ordained to the curacy of Netherfield, Warwickshire, in 1737, and became rector in 1738; and, although he subsequently received other preferments, Netherfield remained his favourite residence. He died there on the 8th of May 1781. He was twice married. Jago’s best-known poem, The Blackbirds, was first printed in Hawkesworth’s Adventurer (No. 37, March 13, 1753), and was generally attributed to Gilbert West, but Jago published it in his own name, with other poems, in R. Dodsley’s Collection of Poems (vol. iv., 1755). In 1767 appeared a topographical poem, Edge Hill, or the Rural Prospect delineated and moralized; two separate sermons were published in 1755; and in 1768 Labour and Genius, a Fable.

Shortly before his death Jago revised his poems, and they were published in 1784 by his friend, John Scott Hylton, as Poems: Moral and Descriptive.

See a notice prefixed to the edition of 1784: A. Chalmers, English Poets (vol. xvii., 1810); F. L. Colville, Warwickshire Worthies (1870); some biographical notes are to be found in the letters of Shenstone to Jago printed in vol. iii. of Shenstone’s Works (1769).

JAGUAR (Felis onca), the largest species of the Felidae found on the American continent, where it ranges from Texas through Central America to Paraguay. In the countries which bound its northern limit it is not frequently met with, but in South America it is quite common, and Don Felix de Azara states that when the Spaniards first settled in the district between Montevideo and Santa Fé, as many as two thousand were killed yearly. The jaguar is usually found singly (sometimes in pairs), and preys upon such quadrupeds as the horse, tapir, capybara, dogs or cattle. It often feeds on fresh-water turtles; sometimes following the reptiles into the water to effect a capture, it inserts a paw between the shells and drags out the body of the turtle by means of its sharp claws. Occasionally after having tasted human flesh, the jaguar becomes a confirmed man-eater. The cry of this great cat, which is heard at night, and most frequently during the pairing season, is deep and hoarse in tone, and consists of the sound pu, pu, often repeated. The female brings forth from two to four cubs towards the close of the year, which are able to follow their mother in about fifteen days after birth. The ground colour of the jaguar varies greatly, ranging from white to black, the rosette markings in the extremes being but faintly visible. The general or typical coloration is, however, a rich tan upon the head, neck, body, outside of legs, and tail near the root. The upper part of the head and sides of the face are thickly marked with small black spots, and the rest of body is covered with rosettes, formed of rings of black spots, with a black spot in the centre, and ranged lengthwise along the body in five to seven rows on each side. These black rings are heaviest along the back. The lips, throat, breast and belly, the inside of the legs and the lower sides of tail are pure white, marked with irregular spots of black, those on the breast being long bars and on the belly and inside of legs large blotches. The tail has large black spots near the root, some with light centres, and from about midway of its length to the tip it is ringed with black. The ears are black

behind, with a large buff spot near the tip. The nose and upper lip are light rufous brown. The size varies, the total length of a very large specimen measuring 6 ft. 9 in.; the average length, however, is about 4 ft. from the nose to root of tail. In form the jaguar is thick-set; it does not stand high upon its legs; and in comparison with the leopard is heavily built; but its movements are very rapid, and it is fully as agile as its more graceful relative. The skull resembles that of the lion and tiger, but is much broader in proportion to its length, and may be identified by the presence of a tubercle on the inner edge of the orbit. The species has been divided into a number of local forms, regarded by some American naturalists as distinct species, but preferably ranked as sub-species or races.

JAGUARONDI, or YAGUARONDI (Felis jaguarondi), a South American wild cat, found in Brazil, Paraguay and Guiana, ranging to north-eastern Mexico. This relatively small cat, uniformly coloured, is generally of some shade of brownish-grey, but in some individuals the fur has a rufous coat, while in others grey predominates. These cats are said by Don Felix de Azara to keep to cover, without venturing into open places. They attack tame poultry and also young fawns. The names jaguarondi and eyra are applied indifferently to this species and Felis eyra.

JAHANABAD, a town of British India in Gaya district, Bengal, situated on a branch of the East Indian railway. Pop. (1901), 7018. It was once a flourishing trading town, and in 1760 it formed one of the eight branches of the East India Company’s central factory at Patna. Since the introduction of Manchester goods, the trade of the town in cotton cloth has almost entirely ceased; but large numbers of the Jolaha or Mahommedan weaver caste live in the neighbourhood.

JAHANGIR, or JEHANGIR (1569-1627), Mogul emperor of Delhi, succeeded his father Akbar the Great in 1605. His name was Salim, but he assumed the title of Jahangir, “Conqueror of the World,” on his accession. It was in his reign that Sir Thomas Roe came as ambassador of James I., on behalf of the
JAHIZ—JAHN, OTTO

English company. He was a dissolute ruler, much addicted to drunkenness, and his reign is chiefly notable for the influence exerted by his wife Nur Jahan, "the Light of the World." At first she influenced Jahangir for good, but surrounding herself with her relatives she aroused the jealousy of the imperial princes; and Jahangir died in 1627 in the midst of a rebellion headed by his son, Khurram or Shah Jahan, and his greatest general, Mahabat Khan. The tomb of Jahangir is situated in the gardens of Shadhera on the outskirts of Lahore.

JAHIZ (Abū 'Uthmān 'Amr Ibn Bahr Ul-Jāhīz, i.e. "the man the pupils of whose eyes are prominent") (d. 860), Arabian writer. He spent his life and devoted himself in Basra chiefly to the study of polite literature. A Mu'tazilite in his religious beliefs, he developed a system of his own and founded a sect named after him. He was favoured by Ibn uz-Zalāyat, the vizier of the caliph Watīq.

His work, the Kitāb al-Bayān wa-Tabyīn, a discursive treatise on rhetoric, has been published in two volumes at Cairo (1895). The Kitāb al-Maḥāsin wa-Addādād was edited by G. v. Vloten Le Livre des beautés et des antithèses (Leiden, 1898); the Kitāb al-Buṭūd, Li Livre des annes, ed. by the same G. v. Vloten, 1817. Two other smaller works, the Excellences of the Turks and the Superiority in Glory of the Blacks over the Whites, also prepared by the same. The Kitāb al-Nawāvi, or "Book of Animals," a philological and literary, not a scientific, work, was published at Cairo (1906).

JAHN, FRIEDRICH LUDWIG (1775-1852), German pedagogue and patriot, commonly called Turnmaister ("Father of Gymnastics"), was born in Lanz on the 11th of August 1778. He studied theology and philology from 1796 to 1802 at Halle, Göttingen and Greifswald. After Jena he joined the Prussian army. In 1809 he went to Berlin, where he became a teacher at the Gymnasmum zu Grauen as well as at the Plannam School. Brooding upon the humiliation of his native land by Napoleon, he conceived the idea of restoring the spirits of his countrymen by the development of their physical and moral powers through the practice of gymnastics. The first Turnplatz, or open-air gymnasium, was opened by him at Berlin in 1811, and the movement spread rapidly, the young gymnasts being taught to regard themselves as members of a kind of gild for the emancipation of their fatherland. This patriotic spirit was nourished in no small degree by the writings of Jahn. Early in 1813 he took an active part at Breslau in the formation of the famous corps of Lützow, a battalion of which he commanded, though during the same period he was often employed in secret service. After the war he returned to Berlin, where he was appointed state teacher of gymnastics. As such he was a leader in the formation of the student Burschenschaften (patriotic fraternities) in Jena.

A man of democratic nature, rugged, honest, eccentric and outspoken, Jahn often came into collision with the reactionary spirit of the time, and this conflict resulted in 1836 in the closing of the Turnplatz and the arrest of Jahn himself. Kept in semi-confinement at the fortress of Kollberg until 1824, he was then sentenced to imprisonment for two years; but this sentence was reversed in 1825, though he was forbidden to live within ten miles of Berlin. He therefore took up his residence at Freyburg on the Unstrut, where he remained until his death, with the exception of a short period in 1828, when he was exiled to Cölln on a charge of sedition. In 1840 he was decorated by the Prussian government with the Iron Cross for bravery in the wars against Napoleon. In the spring of 1848 he was elected by the district of Naumburg to the German National Parliament. Jahn died on the 15th of October 1852 in Freyburg, where a monument was erected in his honour in 1859.

Among his works are the following: Bereicherung des hochdeutschen Sprachkates (Leipzig, 1806), Deutsches Volkstum (Lübeck, 1810), Runenblätter (Frankfort, 1814), Neue Runenblätter (Naumburg, 1828), Mark zu den deutschen Volkstrinken (Hilburchhausen, 1833), and Selbstvertheidigung (Vindication) (Leipzig, 1835). A complete edition of his works appeared at Hof in 1884-1887. See the biography by Schulteis, Berlin, 1894, and Jahn als Erzieher, by Friedrich (Munich, 1895).

JAHN, JOHANN (1759-1816), German Orientalist, was born at Tasswitz, Moravia, on the 18th of June 1759. He studied philosophy at Olmütz, and in 1772 began his theological studies at the Premonstratensian convent of Bruck, near Znaim. Having been ordained in 1775, he for a short time held a cure at Mštitz, but was soon recalled to Bruck as professor of Oriental languages and Biblical hermeneutics. On the suppression of the convent by Joseph II. in 1784, Jahn took up similar work at Olmütz, and in 1789 he was transferred to Vienna as professor of Oriental languages, biblical archaeology and dogmatics. In 1792 he published his Einleitung ins alte Testament (2 vols.), which soon brought him into trouble; the cardinal-archbishop of Vienna laid a complaint against him for having departed from the traditional teaching of the Church, e.g. by asserting Job, Jonah, Tobit and Judith to be didactic poems, and the cases of demonic possession in the New Testament to be cases of dangerous disease. An ecclesiastical commission reported that the views themselves were not necessarily heretical, but that Jahn had erred in showing too little consideration for the views of German Catholic theologians in coming into conflict with his bishop, and in raising difficulties of the problems by which he might be led astray. He was accordingly advised to modify his expressions in future. Although he appears honestly to have accepted this judgment, the hostility of his opponents did not cease until at last (1806) he was compelled to accept a canony at St Stephen's, Vienna, which involved the resignation of his chair. This step had been preceded by the condemnation of his Introductio in libros sacros veteris foederis in compendium redacta, published in 1804, and also of his Archaeologia biblica in compendium redacta (1805).

The only work of importance, outside the region of mere philology, afterwards published by him, was the Enchiridion Hermeneuticarum (1812). He died on the 16th of August 1816.

Besides the works already mentioned, he published Hebräische Sprachlehrer für Anfänger (1792); Aramäische od. Chaldäische u. Syrische Sprachlehrer für Anfänger (1793); Arabische Sprachlehre (1796); Elementarlehr der hebr. Sprache (1799); Chaldische Chrestomathie (1800); Arabische Chrestomathie (1802); Lexicon arabo-latinum chrestomatiae accommodatum (1802); an edition of the Hebrew Bible (1806); Grammatica lingua hebraicae (1809); a critical commentary on the Mazamotic passages of the Old Testament (Vaticina prophetae eus๛erarum de Jesu Messia, 1815). In 1821 a collection of Nachträ gele appeared, containing six dissertations on Biblical subjects. The English translation of the Archlogica by T. C. Upham (1840) has passed through several editions.

JAHN, OTTO (1813-1869), German archaeologist, philologist, and writer on art and music, was born at Kiel on the 16th of June 1813. After the completion of his university studies at Kiel, Leipzig and Berlin, he travelled for three years in France and Italy; in 1839 he became privatdocent at Kiel, and in 1842 professor-extraordinary of archaeology and philology at Greifswald (ordinary professor 1843). In 1847 he accepted the chair of archaeology at Leipzig, of which he was deprived in 1851 for having taken part in the political movements of 1848-1849. In 1855 he was appointed professor of the science of antiquity, and occupied this chair until his death. He was appointed the chair of art in the new university of Born, and in 1859 he was called to succeed E. Gerhard at Berlin. He died at Göttingen, on the 9th of September 1869.

The following are the most important of his works: 1. Archaeological: Palamedes (1836); Telephasis u. Troslos (1841); Die Gemälde im Grab des Chrestos (1842, 2 vols., 3rd ed. 1846); Chrestos (1842, 2 vols., 3rd ed. 1846); Onomae (1844); Die heilige Kunst (1846); Pelikh, die Götter der Überredung (1847); Über einige Darstellungen des Paris-Urteils (1849); Die Perikomachische (1852); Pausaniasia sacraria (ed., 3rd ed. 1855); Geschichtlichen griechischer Dichter auf Vasenbildern (1861). 2. Philological: Critical editions of Juvenal, Persius and Sulpicia (3rd ed. by F. Bächler, 1893); Censorinus (1845); Florus (1852); Cicero's Brutus (4th ed., 1877); and Orator (1861); Statius (1866); Ate et Videol VII (3rd ed. 1845); Ethnologies (3rd ed. 1855); Longinus (1867; 3rd ed. by J. Vahlen, 1905). 3. Biographical and aesthetic: Über Mendelssohns Paulus (1842); Biographie Morceaux, a work of extraordinary labour, and of great importance for the history of music (3rd ed. by H. Dieters, 1889-1891; Eng. trans. by P. D. Townsend, 1891); Ludwig Uhland (1865); Gesammelte Aufsätze über Musik (1866); Biographische Aufsätze (1866). His Griechische Bäderchroniken was published after his death, by his nephew A. Michaelis, who has written an
exhaustive biography in Allgemeine Deutsche Biographie, xiii.; see also J. Vahlen, Otto John (1870); C. Bursian, Geschichte der klassischen Philologie in Deutschland.

JAHRUM, a town and district of Persia in the province of Fars, S.E. of Shiraz and S.W. of Darab. The district has thirty-three villages and is famous for its celebrated shahān dates, which are exported in great quantities; it also produces much tobacco and fruit. The water supply is scanty, and most of the irrigation is by water drawn from wells. The town of Jahrum, situated about 90 m. S.E. of Shiraz, is surrounded by a mud-wall 3 m. in circuit which was constructed in 1834. It has a population of about 15,000, one half living inside and the other half outside the walls. It is the market for the produce of the surrounding districts, has six caravanserais and a post office.

JAINS, the most numerous and influential sect of heretics, or nonconformists to the Brahmanical system of Hinduism, in India. They are found in every province of upper Hindustan, in the cities along the Ganges and in Calcutta. But they are more numerous to the west— in Mewar, Gujarat, and in the upper part of the Malabar coast — and are scattered throughout the whole of the southern peninsula. They are mostly traders, and live in the towns; and the wealth of many of their community gives them a social importance greater than would result from their mere numbers. In the Indian census of 1901 they are returned as being 1,334,140 in number. Their magnificent series of temples and shrines on Mount Abu, one of the seven wonders of India, is perhaps the most striking outward sign of their wealth and importance.

The Jains are the last direct representatives on the continent of India of those schools of thought which grew out of the active philosophical speculation and earnest spirit of religious inquiry that prevailed in the valley of the Ganges during the 5th and 6th centuries before the Christian era. For many centuries Jainism was so overshadowed by that stupendous movement, born at the same time and in the same place, which we call Buddhism, that it remained almost unnoticed by the side of its powerful rival. But when Buddhism, whose widely open doors had absorbed the mass of the community, finally swept away, it was at the cost of its pristine purity and gradually died away, the smaller school of the Jains, less diametrically opposed to the victorious orthodox creed of the Brahmins, survived, and in some degree took its place.

Jainism purports to be the system of belief promulgated by Vaddhamāna, better known by his epithet of Mahā-vīra (the great hero), who was a contemporary of Gotama, the Buddha. But the Jains, like the Buddhists, believe that the same system, which had previously been proclaimed through countless ages by each one of a succession of earlier teachers. The Jains count twenty-four such teachers, whom they call Jinas, or Tirthankaras, that is, conquerors or leaders of schools of thought. It is from this word Jina that the modern name Jains, meaning followers of the Jina, or of the Jinas, is derived. This legend of the twenty-four Jinas contains a germ of truth. Mahā-vīra was not an originator; he merely carried on, with but slight changes, a system of religious teaching that had been in existence for hundreds of years, and which in the last two thousand years had been greatly modified and changed.

The Jain chronology, to have been born two hundred years before Mahā-vīra (that is, about 760 B.C.); but the only conclusion that it is safe to draw from this statement is that Pārśva was considerably earlier in point of time than Mahā-vīra. Very little reliance can be placed upon the details reported in the Jain books concerning the previous Jinas in the list of the twenty-four Tirthankaras. The curious will find in them many reminiscences of Hindu and Buddhist legend; and the antiquity must notice the distinctive symbols assigned to each, in order to recognize the statues of the different Jinas, otherwise identical, in the different Jain temples.

The Jains are divided into two great parties—the Digambaras, or Sky-clad Ones, and the Svetāmbaras, or the White-robed Ones. The latter have only as yet been traced, and that doubtfully, as far back as the 5th century after Christ; the former are almost certainly the same as the Nigāṇṭhās, who are referred to in numerous passages of the Buddhist Pāli Pūjakas, and must therefore be at least as old as the 6th century B.C. Professor Jacobi has published a complete edition of the twenty-four sūtras, the latest of which contains the teachings of Nigāṇṭha Nāṭaputta (that is, the Nigāṇṭha of the Jñātrikas) to enable us to identify him, without any doubt, as the same person as the Vaddhamāna Mahā-vīra of the Jain books. This remarkable confirmation, from the scriptures of a rival religion, of the Jain tradition is conclusive as to the date of Mahā-vīra. The Nigāṇṭhās are referred to in one of Asoka's edicts (Corpus Inscriptionum, Plate xx). Unfortunately the account of the teachings of Nigāṇṭha Nāṭaputta given in the Buddhist scriptures are, like those of the Buddha's teachings given in the Brahmanical literature, very meagre.

Jain Literature.—The Jain scriptures themselves, though based on earlier traditions, are not older in their present form than the 5th century of our era. The most distinctively sacred books are known as the Jaina Purāṇas, of which there are twelve,—the Uttarān, Mahāvaiga, Purāṇa, Kanakamuni, Rabahuvajra, Devyāgrava, Silakṣetramata, Vardhamāna, Galav, Harshahr, and Utpalagas. Of these, the Purāṇa is the collection of the most ancient Jaina scriptures, the others being simply additions to it. The earliest Jain writings are in the language, and it is probable that they contain much later material. The problem remains to sort out the older from the later, to distinguish between the earlier form of the faith and its subsequent developments, and to collect the numerous documents containing the teachings of the leaders of the sect into these forty-five Agamas. Like the Buddhist scriptures, the earlier Jain books are written in a dialect of their own, the so-called Jaina Prakrit; and it was not till between the 2nd and 3rd centuries of our era that the Jains translated them into Sanskrit as their literary language. Considerable progress has been made in recent years in the publication and elucidation of these original authorities. But a great deal remains yet to be done. The oldest books now in the possession of the modern Jains purport to be, not the foundation of the existing order in the 6th century B.C., but only the beginning of the 2nd century B.C.

Professor Jacobi has published a complete edition of these books. The critical value of this edition, and of the other editions of separate texts printed elsewhere in India, leaves much to be desired. Professor Jacobi has edited and translated the Kalpa Sūtra, containing a life of the founder of the Jaina order; but this can scarcely be older than the 5th century of our era. He also published and translated the Aydārya Sūtra of the Svetāmbara Jain. The text, published by the Pali Text Society, is of 140 pages octavo. The first part of it, 50 pages, is a very old document dating before 500 B.C., and the second part consists of numerous additions, added at different times, on the same subject. The older part may go back as early as the 3rd century B.C., and it sets out more especially the Jain doctrine of tāpasa or self-mortification, in which it was distinguished from the Buddhist form of asceticism.

The rules of conduct in this book are for members of the order.

1. Professor Rudolf Haeberlin, and translated an ancient text on the rules of conduct for laitymen, the Udāsana Daśas, in the Oriental Translation Society's series.

2. Professor Leumann, and edited and translated a remarkable collection of Jain literature, a part of which is now available to the European scholar. The sect of the Svetāmbara has preserved the oldest literatures. Dr. Haeberlin has treated of the early history of...
the sect in the Proceedings of the Asiatic Society of Bengal for 1898. Several scholars—notably Bhavanil Indraji, Mr. Lewis Rice and Hofrath Bühler—have treated of the remarkable archaeological discoveries lately made. These confirm the older records in many details, and show that the Jains, in the centuries before the Christian era, were a wealthy and important body in widely separated parts of India.

**Jainism.**—The most distinguishing outward peculiarity of Mahā-vira and of his earlier followers was their practice of going quite naked, whence the term Digambara. Against this custom, Gotama, the Buddha, especially warned his followers; and it is referred to in the well-known Greek phrase, Gymnosophist, used already by Megasthenes, which applies very aptly to the Niganthas. Even the earliest name Nigantha, which means "free from bonds," may not be without allusions to this curious belief in the sanctity of nakedness, though it also alluded to freedom from the bonds of sin and of transmigration. The statues of the Jinas in the Jain temples, some of which are of enormous size, are still always quite naked; but the Jains themselves have abandoned the practice, the Digambaras being sky-clad at meal-time only, and the Svetāmbaras being always completely clothed. Among the Digambaras it is only the recluses or Yatis, men devoted to a religious life, who carry out this practice. The Jain laity—the Śrāvakas, or disciples—do not adopt it.

The Jain views of life were, in the most important and essential respects, the exact reverse of the Buddhist views. The two orders, Buddhist and Jain, were not only, and from the first, independent, but directly opposed the one to the other. In philosophy the Jains are the most thorough-going supporters of the old animistic position. Nearly everything, according to them, has a soul within its outward visible shape—not only men and animals, but also all plants, and even particles of earth, and of water (when it is cold), and fire and wind. The Buddhist theory, as is well known, is put together without the hypothesis of "soul" at all. The word the Jains use for soul is jīva, which means life; and there is much analogy between many of the expressions they use and the view that the ultimate cells and atoms are all, in a more or less modified sense, alive. They regard good and evil as ultimate substances which come into direct contact with the minute souls in everything. And their best-known position in regard to the points most discussed in philosophy is Śyād-vāda, the doctrine that you may say "Yes" and at the same time "No" to everything. You affirm theernity of the world, for instance, from one point of view, and at the same time deny it from another; or, at different times and in different connexions, you may one day affirm it and another day deny it. This position both leads to vagueness of thought and explains why Jainism has had so little influence over other schools of philosophy in India. On the other hand, the Jains are as determined in their views of asceticism (tāpas) as they were compromising in their views of philosophy. Any injury done to the "souls" being one of the worst of iniquities, the good monk should not wash his clothes (indeed, the most austere will reject clothes altogether), nor even wash his teeth, for fear of injuring living things. "Subdue the body, chastise thyself, weaken thyself, just as fire consumes dry wood." It was by suppressing, through such self-torture, the influence on his soul of all sensations that the Jain could obtain salvation. It is related of the founder himself, the Mahā-vira, that after twelve years' penance he thus obtained Nirvāṇa (Jacob, Jainā Sātras, i. 202) before he entered upon his career as a teacher. And through the rest of his life, till he died at Patan at the age of the Buddha, he followed the same habit of continual self-mortification. The Buddha, on the other hand, obtained Nirvāṇa in his 35th year, under the Bo tree, after he had abandoned penance; and through the rest of his life he spoke of penance as quite useless from his point of view.

There is no mal of Jainism as yet published, but there is a great deal of information on various points in the introductions to the works referred to above. Professor Jacob, who is the best authority on the history of this sect, thus sums up the distinction between the Mahā-vira and the Buddha: "Mahā-vira was rather of the ordinary class of religious men in India. He may have been a little on religious matters, but he possessed not the greatness which Buddha undoubtedly had. . . . The Buddha's philosophy forms a system based on a few fundamental ideas, whilst that of Mahā-vira scarcely forms a system, but is merely a sum of opinions (pavnattis) on various subjects, no fundamental ideas being there to uphold the mass of metaphysical matter. Besides this . . . it is the ethical element that gives to the Buddhist writings their superiority over those of the Jains. Mahā-vira treated ethics as corollary and subordinate to his metaphysics, with which he was chiefly concerned."

**JAIPUR,** or JAYPORE, a city and native state of India in the Rajputana agency. The city is a prosperous place of comparatively recent date. It derives its name from the famous Maharaja Singh II, who founded it in 1728. It is built of pink stucco in imitation of sandstone, and is remarkable for the width and regularity of its streets. It is the only city in India that is laid out in rectangular blocks, and it is divided by cross streets into six equal portions. The main streets are 111 ft. wide and are paved, while the city is lighted by gas. The regularity of plan, and the straight streets with the houses all built after the same pattern, deprive Jaipur of the charm of the East, while the painted mud walls of the houses give it the megalomaniac air of stage scenery. The huge palace of the maharaja stands in the centre of the city. Another noteworthy building is Singh's observatory. The chief industries are in metals and marble, which are fostered by a school of art, founded in 1868. There is also a wealthy and enterprising community of native bankers. The city has three colleges and several hospitals. Pop. (1901), 160,167. The ancient capital of Jaipur was Amber.

The **STATE OF JAIPUR**, which takes its name from the city, has a total area of 15,579 sq. m. Pop. (1901), 2,528,666, showing a decrease of 6% in the decade. The estimated revenue is 430,000, and the tribute 27,000. The centre of the state is a sandy and barren plain 1,600 ft. above sea-level, bounded on the E. by ranges of hills running north and south. On the N. and W. it is bounded by a broken chain of hills, an offshoot of the Aravalli mountains, beyond which lies the sandy desert of Rajputana. The soil is generally sandy. The hills are more or less covered with jungle trees, of no value except for fuel. Towards the S. and E. the soil becomes more fertile. Salt is very plentiful, and the air is unhealthy, owing to the huge salt lake, which is worked by the government of India under an arrangement with the states of Jaipur and Jodhpur. It yields salt of a very high quality. The state is traversed by the Rajputana railway, with branches to Agra and Delhi.

The maharaja of Jaipur belongs to the Kachwaha clan of Rajputs, claiming descent from Rama, king of Ayodhya. The state is said to have been founded about 1728 by Dhula Rai, from Gwalior, who with his Kachhwas is said to have absorbed or driven out the petty chieftains. The Jaipur house furnished to the Moguls some of their most distinguished generals. Among them were Man Singh, who fought in Orissa and Assam; Jai
Singh, commonly known by his imperial title of Mirza Raja, whose name appears in all the wars of Aurangzeb in the Deccan; and Jai Singh II, or Sawai Jai Singh, the famous mathematician and astronomer, and the founder of Jaipur city. Towards the end of the 18th century the Jats of Bharatpur and the chief of Alwar each annexed a portion of the territory of Jaipur. By the end of the century the state was in great confusion, distracted by internal broils and impoverished by the exactions of the Mahattas. The disputes between the chiefs of Jaipur and Jodhpur had brought both states to the verge of ruin, and Amir Khan with the Pindaris was exhausting the country. By a treaty in 1818 the protection of the British was extended to Jaipur and an annual tribute fixed. In 1835 there was a serious disturbance in the city, after which the British government took measures to insist upon order and to reform the administration as well as to princes had now arrived at the height of their power, but from this time till the accession of Ráwal Mulraj in 1762 the fortunes of the state rapidly declined, and most of its outlying provinces were lost. In 1816 Mulraj entered into political relations with the British. Maharawal Salivahan, born in 1887, succeeded to the chiefship in 1891.

JAYPEE, or JAIPUR, a town and native state of India in the Rajputana agency. The town stands on a ridge of yellowish sandstone, crowned by a fort, which contains the palace and several ornate Jain temples. Most of the houses and temples are finely sculptured. Pop. (1901), 75,133. The area of the state is 16,662 sq. m. In 1901 the population was 73,370, showing a decrease of 37% in ten years, as a consequence of famine. The estimated revenue is about £6,000; there is no tribute. Jaipur is almost entirely a sandy waste, forming a part of the great Indian desert. The general aspect of the country is that of an interminable sea of sandhills, of all shapes and sizes, some rising to a height of 150 ft. Those in the west are covered with phog bushes, those in the east with tufts of long grass. Water is scarce, and generally brackish; the average depth of the wells is said to be about 250 ft. There are no perennial streams, and only one small river, the Kalkini, which, after flowing a distance of 28 m., spreads over a large surface of flat ground and is joined by the rivulet Koja, the Jajce, the Bhuj-Hil, and the Chist rivers. The climate is dry and healthy. Throughout Jaipur many rain-crops, such as bajra, jowar, moth, til, c&c., are grown; spring crops of wheat, barley, c&c., are very rare. Owing to the scant rainfall, irrigation is almost unknown.

The main part of the population lead a wandering life, grazing their flocks and herds. Large herds of camels, horned cattle, sheep and goats are kept. The principal trade is in wool, ghi, camels, cattle and sheep. The chief imports are grain, sugar, foreign cloth, piece-goods, c&c. Education is at a low ebb. Jain priests are the chief clerics of their sect, and the chief of Jaipur is styled maharawal. The state suffered from famine in 1897, 1900 and other years, to such an extent that it has had to incur a heavy debt for extraordinary expenditure. There are no railways.

The majority of the inhabitants are Bhatti Rajputs, who take their name from an ancestor named Bhatti, renowned as a warrior when the tribe were located in the Punjab. Shortly after this the clan was driven southwards, and found a refuge in the Indian desert, which was thenceforth its home. Deoráj, a famous prince of the Bhatti family, is esteemed the real founder of the present Jaipur dynasty, of which him the present ruler is descended. In 1150 Deoráj, the sixth in succession from Deoráj, founded the fort and city of Jaipur, and made it his capital. In 1294 the Bhattis so enraged the emperor All-ud-din that his army captured and sacked the fort and city of Jaipur, so that for some time it was quite deserted. After this there is nothing to record till the time of Ráwal Sahal Singh, whose reign marks an epoch in Bhatti history in that he acknowledged the supremacy of the Mogul emperor Sháh Jahn. The Bhattis were now in a state of confusion, and the fort and city of Jaipur were again occupied by the Bhattis, who were finally restored to their rights. From the time of Ráwal Sahal Singh the cause of the state was rapidly declined, and most of its outlying provinces were lost. In 1816 Mulraj entered into political relations with the British. Maharawal Salivahan, born in 1887, succeeded to the chiefship in 1891.
advocate in Germany the necessity of a distinct science dealing specially with the subject of national wealth. His principal other works are Grundriss der allgemeinen Logik (Halle, 1788); Grundsätze der Polizeiorganisation und Polizeiämter (Leipzig, 1809); Einleitung in die politischen Staatswissenschaften (Halle, 1819); Entwurf eines Criminalgesetzbuches für das russische Reich (Halle, 1818) and Staatsfinanzwissenschaft (2 vols., Halle, 1821).

JAKOVA (also written DIJKOVA, GYAKOVO and GYAKOVICA), a town of Albania, European Turkey, in the vilayet of Kossovo; on the river Erenik, a right-hand tributary of the White Drin. Pop. (1905) about 12,000. Jakova is the chief town of the Alpine region which extends from the Montenegrin frontier to the Drin and White Drin. This region has never been thoroughly explored, or brought under effective Turkish rule, on account of the inaccessible character of its mountains and forests, and the lawlessness of its inhabitants—a group of two Roman Catholic and three Moslem tribes, known collectively as the Malsa Jakovs, whose official representative resides in Jakova.

JAKUNS, an aboriginal race of the Malay Peninsula. They have become much mixed with other tribes, and are found throughout the south of the peninsula and along the coasts. The purest types are straight-haired, exhibit marked Mongoloid characteristics and are closely related to the Malays. They are probably a branch of the Pre-Malays, the "savage Malays" of A. R. Wallace. They are divided into two groups: (1) Jakuns of the jungle, (2) Jakuns of the sea or Orang Laut. The latter set of tribes now comprise the remnants of the pirates or "sea-gypsies" of the Malaccan straits. The Jakuns, who must be studied in conjunction with the other aboriginal peoples of the Malay Peninsula, the Semangs and the Sakais, are not so dwarfish as those. The head is round; the skin varies from olive-brown to dark copper; the face is flat and the lower jaw square. The nose is thick and short, with wide, open nostrils. The cheek-bones are high and well marked. The hair has a blue-black tint, eyes are black and the beard is scanty. The Jakuns live a wild forest life, and in general habits much resemble the Sakai, being but little in advance of the latter in social conditions except where they come into close contact with the Malay peoples.

JALALABAD, or JELLALABAD, a town and province of Afghanistan. The town lies at a height of 1500 ft. in a plain on the south side of the Kabul river, 96 m. from Kabul and 76 from Peshawar. Estimated pop., 4000. Between it and Peshawar intervenes the Khyber Pass, and between it and Kabul the passes of Jagdalak, Khurd Kabul, &c. The site was chosen by the emperor Baber, and he laid out some gardens here; but the town itself was built by his grandson Akbar in A.D. 1560. It resembles the city of Kabul on a smaller scale, and has one central bazaar, the streets generally being very narrow. The most notable episode in the history of the place is the famous defence by Sir Robert Sale during the first Afghan war, when he held the town from November 1841 to April 1842. On its evacuation in 1842 General Pollock defended the defences, but they were rebuilt in 1878. The town is now fortified, surrounded by a wall with bastions and loopholes. The province of Jalalabad is about 80 m. in length by 35 m. in width, and includes the large district of Laghman north of the Kabul river, as well as that on the south called Ningrabah. The climate of Jalalabad is similar to that of Peshawar. As a strategical centre Jalalabad is one of the most important positions in Afghanistan for it dominates the entrances to the Laghman and the Kunar valleys; commanding routes to Chitrail or India north of the Khyber, as well as the Kabul-Peshawar road.

JALAP, a cathartic drug consisting of the tuberous roots of Ipomaea Purga, a convolvolaceous plant growing on the eastern declivities of the Mexican Andes at an elevation of 5000 to 8000 ft. above the level of the sea, more especially about the neighbourhood of Chiconquiao, and near San Salvador on the eastern slope of the Cordf de Perote. Jalap has been known in Europe since the beginning of the 17th century, and derives its name from the city of Jalapa in Mexico, near which it grows, but its botanical source was not accurately determined until 1829, when Dr. J. R. Coxe of Philadelphia published a description and coloured figure taken from living plants sent him two years previously from Mexico. The jalap plant has slender herbaceous twining stems, with alternately placed heart-shaped pointed leaves and salver-shaped deep purplish-pink flowers. The underground stems are slender and creeping; their vertical roots enlarge and form turnip-shaped tubers. The roots are dug up in Mexico throughout the year, and are suspended to dry in a net over the hearth of the Indians' huts, and hence acquire a smoky odour. The large tubers are often gashed to cause them to dry more quickly. In their form they vary from spindle-shaped to ovoid or globular, and in size from a pigeon's egg to a man's fist. Externally they are brown and marked with small transverse paler scars, and internally they present a dirty white

resinous or starchy fracture. The ordinary drug is distinguished in commerce as Vera Cruz jalap, from the name of the port whence it is shipped.

Jalap has been cultivated for many years in India, chiefly at Ootacamund, and grows there as easily as a yam, often producing clusters of tubers weighing over 9 lb; but these, as they differ in appearance from the commercial article, have not as yet obtained a place in the English market. They are found, however, to be rich in resin, containing 18%. In Jamaica also the plant has been grown, at first amongst the chinchoa trees, but more recently in new ground, as it was found to exhaust the soil.

Besides Mexican or Vera Cruz jalap, a drug called Tampico jalap has been imported for some years in considerable quantity. It has a much more shrivelled appearance and paler colour than ordinary jalap, and lacks the small transverse scars present in the true drug. This kind of jalap, the Purga de Sierra Gordas of the Mexicans, was traced by Hanbury to Ipomoea simulans.
It grows in Mexico along the mountain range of the Sierra Gorda in the neighbourhood of San Luis de la Paz, from which district it is carried down to Tampico, whence it is exported. A third variety of jalap known as woody jalap, male jalap, or Orizaba root, or by the Mexicans as Purgar macho, is derived from *Iponaeca orizabensis*, a plant of Orizaba. The root occurs in feebly pieces, which are usually rectangular blocks of irregular shape, 2 in. or more in diameter, and are evidently portions of a large root. It is only occasionally met with in commerce.

The dose of jalap is from five to twenty grains, the British Pharmacopoeia directing that it must contain from 9 to 11% of the resin, which is given in doses of two to five grains. One preparation of this drug is in common use, the *Jalapae Contra Convulsivum* containing 0.9% of cream of tartar, and 1 of ginger. The dose is from 20 grains to a drachm. It is best given in the maximum dose which causes the minimum of irritation.

The chief constituents of jalap resin are two glucosides—*convulalin* and *jalapin*—sugar, starch and gum. Convulalin constitutes nearly 20% of the resin. It is insoluble in ether, and is more active than jalapin. It is not used separately in medicine. Jalapin is present in about the same proportions. It dissolves readily in ether, and has a slight resinous consistence. It may be given in half-grain doses. It is the active principle of the allied drug *scammony*. According to Mayer, the formula of convulalin is C20H20O6, and that of jalapin is C21H22O6.

Jalap is a typical hydrogogue purgative, causing the excretion of more fluid than scammony, but producing less stimulation of the muscular wall of the bowel. For both reasons it is preferable to scammony. It was shown by Professor Rutherford at Edinburgh to be a powerful secretory cholagogue, an action possessed by few hydrogogue purgatives. The stimulation of the liver is said to depend upon the solution of the resin by the intestinal secretion. The drug is employed in cases of Bright’s disease and dropsy from any cause, being especially useful when the liver shares in the general venous congestion. It is not much used in ordinary constipation.

**JALAPA—JALISCO**

In early times Jalaun seems to have been the home of two Rajput clans, the Chandels in the east and the Kachwahas in the west. The town of Kalpi on the Jumna was conquered for the princes of Ghor as early as 1196. Early in the 14th century the Bundelas occupied the greater part of Jalaun, and even succeeded in holding the fortified post of Kalpi. That important possession was soon recovered by the Musulmans, and passed under the sway of the Mogul emperors. Akbar’s governors at Kalpi maintained a nominal authority over the surrounding district; and the Bundela chiefs were in a state of chronic revolt, which culminated in the war of independence under Chhatar Sal. On the outbreak of his rebellion in 1671 he occupied a large province to the south of the Jumna. Setting out from this basis, and supported, not only by the Mahratta and Bundela states, but also by the Mogul empire, he extended his power over the whole of Bundelkhand. On his death he bequeathed one-third of his dominions to his Mahratta allies, who before long succeeded in annexing the whole of Bundelkhand. Under Mahratta rule the country was a prey to constant anarchy and intestine strife. To this period must be traced the origin of the poverty and desolation which are still conspicuous throughout the district. In 1806 Kalpi was made over to the British, and in 1840, on the death of Nana Gobind Ras, his possessions lapsed to them also. Various interchanges of territory took place, and in 1856 the present boundaries were substantially settled. Jalaun had a bad reputation during the Mutiny. When the news of the rising at Cawnpore reached it, the Mahrattas, the men of the 3rd native infantry deserted their officers, and in June the Jhansi mutineers reached the district, and began their murther of Europeans. The inhabitants of Jalaun were revelled in the licence of plunder and murder which the Mutiny had spread through all Bundelkhand, and it was not till September 1858 that the rebels were finally defeated.

**JALISCO, XALISCO, OR GUADALAJARA**, a Pacific coast state of Mexico, of very irregular shape, bounded, beginning on the N., by the territory of Tepic and the states of Durango, Zacatecas, Aguas Calientes, Guanajuato, Michoacán, and Colima. Pop. (1900), 1,153,891. Area, 31,826 sq. m. Jalisco is traversed from N.N.W. to S.S.E. by the Sierra Madre, locally known as the Sierra de Nayarit and Sierra de Jalisco, which divides the state into a low heavily forested coastal plain and a high plateau region, part of the great And模糊 table-land, with an average elevation of about 3000 ft., broken by spurs and flanking ranges of moderate height. The Sierra region is largely unpeopled and earthquakes are frequent; in the S. are the active volcanoes of Colima (12,750 ft.) and the Nevado de Colima (14,363 ft.). The *tierra caliente* zone of the coast is tropical, humid, and unfavourable to Europeans, while the inland plateaux vary from sub-tropical to temperate and are generally drier and healthful. The greater part of the state is drained by the Rio Grande de Lerma (called the Santiago on its lower course) and its tributaries, chief of which is the Rio Verde. Lakes are numerous; the largest are the Chapala, about 80 m. long by 10 to 35 m. wide, which is considered one of the most beautiful inland sheets of water in Mexico, the Sayula and the Magdalena, noted for their abundance of fish. The agricultural products of Jalisco include maize, beans, wheat, rice, cotton, sugar, coffee, copper, bismuth, and various precious stones. There are reduction works of the old-fashioned type and some manufactures, including cotton and woollen goods, pottery, refined sugar and leather. The commercial activities of the state contribute much to its prosperity. There is a large percentage of Indians and mestizos in the population. The capital is Guadalajara, and other important towns with their populations in 1900 (unless otherwise stated) are: Zapotlanejo (20,725), 21 m.; by N. of Guadalajara (17,139); Mela (6,864); Ameca (9,715); Teocaltiche (8,881); Ajusco (7,175); Tonalá (7,175); Atlan (7,175); Teocaltiche (8,881); Atlan (7,175); Ameca (7,175). In a fertile agricultural
JALNA—JAMAICA

region on the western slopes of the sierras; Cocola (7000 in 1869); and Zacoalco (6516). Jalisco was first invaded by the Spaniards about 1526 and was soon afterwards conquered by Nuño de Guzman. It once formed part of the reyno of Nueva Galicia, which also included Aguas Calientes and Zacatecas. In 1878 its area was much reduced by a subdivision of its coastal zone, which was set apart as the territory of Tepic.

JALNA, or Jaulna, a town in Hyderabad state, India, on the Godavari branch of the Nizam's railway, and 210 m. N.E. of Bombay. Pop. (1901), 20,270. Until 1903 it was a cantonment of the Hyderabad contingent, originally established in 1827. It gardens produce fruit, which is largely exported. On the opposite bank of the river Kundlik the trading town of Kadirabad; pop. (1901), 11,159.

JALPAIGURI, or Julipore, a town and district of British India, in the Rajshahi division of Eastern Bengal and Assam. The town is on the right bank of the river Tista, with a station on the Eastern Bengal railway about 500 m. due N. of Cuttack. Pop. (1901), 9708. It is the headquarters of the commissioner of the division.

The District of Jalpaiguri (organized in 1860) occupies an irregularly shaped tract south of Darjeeling and Bhutan and north of the state of Kuch Behar. It includes the Western Dwars, annexed from Bhutan after the war of 1864-1865. Area, 2,662 sq. m. Pop. (1901), 787,380, an increase of 16% in the decade. The district is divided into a "regulation" tract, lying towards the south-west, and a strip of country, about 22 m. in width, running along the foot of the Himalayas, and known as the Western Dwars. The former is a continuous expanse of level paddy fields, only broken by groves of bamboos, palms, and fruit-trees. The frontier towards Bhutan is formed by the Sinchula mountain range, some peaks of which attain an elevation of 6000 ft. It is thickly wooded from base to summit. The principal rivers, proceeding from west to east, are the Mahananda, Karatoya, Tista, Jaldhaka, Duduya, Mujnai, Tursa, Kaljani, Raidak, and Sankos. The most important is the Tista, which forms a valuable means of water communication. Lime is quarried in the lower Bhutan hills. The Western Dwars are the principal centre of tea cultivation in Eastern Bengal. The other portion of the district produces jute. Jalpaiguri is traversed by the main line of the Eastern Bengal railway to Darjeeling. It is also served by the Bengal Dwars railway.

JAMAICA, the largest island in the British West Indies. It lies about 80 m. S. of the eastern extremity of Cuba, between 17° 43' and 18° 32' N. and 76° 10' and 78° 20' W., is 144 m. long, 50 m. in extreme breadth, and has an area of 4207 sq. m. The coast-line has the form of a turtle, the mountain ridges representing the back. A mountainous backbone runs through the island from E. to W., throwing off a number of subsidiary ridges, mostly in a north-westerly or south-easterly direction. In the east this range is more distinctly marked, forming the Blue Mountains, with cloud-capped peaks and numerous bifurcating branches. They trend W. by N., and are crossed by five passes at altitudes varying from 3000 to 4000 ft. They culminate at the Blue Mountain Peak (7260 ft.), after which the heights gradually decrease until the range is merged into the hills of the western plateau. Two-thirds of the island are occupied by this limestone plateau, a region of great beauty broken by innumerable hills, valleys and sink-holes, and covered with luxuriant vegetation. The uplands usually terminate in steep slopes or bluffs, separated from the sea, in most cases, by a strip of level land. On the south coast, especially, the plains are often large, the Liguanea plain, on which Kingston stands, having an area of 200 sq. m. Upwards of a hundred rivers and streams find their way to the sea, besides the numerous tributaries which issue from every ravine in the mountains. These streams for the most part are not navigable, and in times of flood they become devastating torrents. In the parish of Portland, the Rio Grande receives all the smaller tributaries from the west. In St Thomas in the east the main range is drained by the Plantain Garden river, the tributaries of which form deep ravines and narrow gorges. The valley of the Plantain Garden expands into a picturesque and fertile plain. The Black river flows through a level country, and is navigable by small craft for about 30 m. The Salt river and its branches, also in the south, are navigable by barges. Other rivers of the south are the Rio Cobre (on which are irrigation works for the sugar and fruit plantations), the Yallahs and the Rio Minho; in the north are the Martha Brac, the White river, the Great Spanish river, and the Rio Grande. Festoons of intermittent volcanic action occur, and there are several medicinal springs. Jamaica has 16 harbours, the chief of which are Port Morant, Kingston, Old Harbour, Montego Bay, Falmouth, St Ann's Bay, Port Maria and Port Antonio.

Geology.—The greater part of Jamaica is covered by Tertiary deposits, but in the Blue Mountain and some of the other regions the older rocks rise to the surface. The foundation of the island is formed by a series of stratified shales and conglomerates, with tuffs and other volcanic rocks and occasional bands of marine limestone. The limestones contain Upper Cretaceous fossils, and the whole series has been strongly folded. Upon this foundation rests unconnectedly a series of marls and limestones of Eocene and early Oligocene age. Some of the limestones are made of Foraminifera, together with Radiolaria, and indicate a subsidence to a abyssal depth. Nevertheless, the higher peaks of the island still remained above the sea. After the first folding had taken place on an extensive scale, the island was raised far above its present level and was probably connected with the rest of the Greater Antilles and perhaps with the mainland also. At the same time rocks of different ages were exposed, and the deposits of the water bodies already formed, and in some cases produced considerable metamorphism. During the Miocene and Pliocene periods the island again sank, but never to the depths which it reached in the Eocene period. The deposits formed at this time are largely of marls and limestones, with mollusca, brachiopoda, corals, &c. Finally, a series of successive elevations of small amount, less than 500 ft. in the aggregate, raised the island to its present level. The terraces which mark the successive stages in this elevation are well shown in Montego Bay and elsewhere. The remarkable depressions of the Cockpit country and the closed basin of the Hector river are similar in origin to swallow-holes, and were formed by the solution of a lime stone layer resting upon insoluble rocks. The island produces a great variety of marls and conglomerates, and in places of these limestones and marls iron ores have been associated with some of the oxidized copper ores (blue and green carbonates) in the Clarendon mines. Copper ores are widely diffused but are very expensive to work; as are the lead and colaspis which are also found. Manganesic iron ores and a form of arsenic occur.

Climate.—The climate is one of the island's chief attractions. Near the coast it is warm and humid, but that of the uplands is delightfully mild and equable. At Kingston the temperature ranges from 70° to 87° F., and this is generally the average of all the low-lying coast land. At Cinchona, 4907 ft. above the sea, it varies from 57° to 68° F. The vapours from the rivers and the ocean produce in the upper regions clouds saturated with moisture which induce vegetation belonging to a colder climate. During the rainy seasons there is such an accumulation of these vapours as to cause a general coolness and occasion sudden heavy showers, and sometimes destructive floods. The rainy seasons, in May and October, last for about three weeks, although, as a rule no month is quite without rain. The fall varies greatly; while the annual average for the island is 66.3 in., at Kingston it is 32.6 in., at Cinchona 105.5 in.; and at some places in the north-east it exceeds 200 in. The climate of the Santa Cruz Mountains is extremely favourable to sufferers from tubercular and rheumatic diseases. Excepting near morasses and lagoons, the island is very healthy, and yellow fever, once prevalent, now rarely occurs. In the early part of the 19th century, hurricanes often devastated Jamaica, but now, though they pass to the N.E. and S.W. with comparative frequency, they rarely strike the island itself.

Flora.—The flora is remarkable, showing types from North, Central, and South America, with a few European forms, besides the many from plants to be found in the tropics. There are flowering plants there are 2180 distinct species, and of ferns 450 species, several of both being indigenous. The largeness of these numbers may be to some extent accounted for by differences of altitude, temperature and humidity. There are many beautiful flowers, such as the aloe, the yucca, the datura the mountain pride and the Victoria regia; and the cactus tribe is well represented. The Sensitive Plant grows in pastures, and orchids in the woods. There are forest...
JAMAICA

trees fit for every purpose; including the ballata, rosewood, satin-wood, mahogany, lignum vitae, lancewood and ebony. The logwood and fustic are exported for dyeing. There are also the Jamaica cedar, and the silk cotton tree (Ceiba Bombax). Pimento (piscual to Jamaica) is exported, and furnishes the allspice. The cocoa and coffee are well known. Several species of palm abound,—the macaw, the fan palm, screw palm, and palmetto royal. There are plantations of cocoa-nut palm. The other noticeable trees and plants are: pine-apple, mango, banana, guava, passion fruit, pine-apple, mango, banana, guava, passion fruit, pimento, ginger, cocoa-nuts, limes, nutmegs, pineapples, tobacco, grape fruit and mangoes. There is a board of agriculture, with an experimental station at Hope; there is also an agricultural society with 26 branches throughout the colony. Bee-keeping is a major industry, especially among the peasants.

The land as a rule is divided into small holdings, the vast majority consisting of five acres and less. The manufactures are few. In addition to the sugar and coffee estates and cigar factories, there are rum distilleries, breweries, electric light companies, ironfoundries, potteries and factories for the production of coconut oil, essential oils, ice, matches and mineral waters. There is an important establishment at Spanish Town for the production of lamp and extract. The exports, more than half of which go to the United States, mostly comprise fruit, sugar and rum. The United States also contributes the majority of the imports. More than half the revenue of the colony is derived from import duties, the remainder is furnished by excise, stamps and licences. With the exception of that of the parish boards, there is no direct taxation.

Communications.—In 1890 an Imperial Direct West India Line of steamers was started by Elder, Dempster & Co., to encourage the fruit trade with England; it had a subsidy of £10,000, contributed jointly by the Imperial and Jamaican governments. Two steamers go round the island once a week, calling at the principal ports, the circuit occupying about 120 hours. A number of sailing droggers also ply from port to port. Jamaica has a number of good roads and bridle paths; the main roads, controlled by the public works department, encircle the island, with several branches from north to south. The parochial roads are maintained by the parish boards. A railway traverses the island from Kingston in the south-east to Montego Bay in the north-west, and also branches to

Port Antonio and to Ewarton. Jamaica is included in the Postal Union and in the Imperial penny post, and there is a weekly mail service to and from England by the Royal Mail Line, but mails are also carried by other companies. The island is connected by cable with the United States via Cuba, and with Halifax, Nova Scotia via Bermuda.

There is a government savings bank at Kingston with branches throughout the island, and there are also branches of the Colonial Bank of London and the Bank of Nova Scotia. The coins in circulation are British gold and silver, but not bronze, instead of which local nickel is used. United States gold passes as currency. English weights and measures are used.

Administration, &c.—The island is divided into three counties, Surrey in the east, Middlesex in the centre, and Cornwall in the west, and each of these is subdivided into five parishes. The parish is the unit of local government, and has jurisdiction over roads, markets, sanitation, poor relief and waterworks. The management is vested in a parish board, the members of which are elected. The chairman or custos is appointed by the governor. The island is administered by a governor, who bears the old Spanish title of captain-general, assisted by a legislative council of five ex officio members, not more than ten nominated members, and fourteen members of the limited franchise. There is also a privy council of three ex officio and nine nominated members.

There is an Imperial garrison of about 2000 officers and men, with headquarters at Newcastle, consisting of Royal Engineers, Royal Artillery, infantry and four companies of the West India Regiment. There is a naval station at Port Royal, and the entrance to its harbour is strongly fortified. In addition there is a militia of infantry and artillery, about 800 strong.

Previous to 1870 the Church of England was established in Jamaica, but in that year a disestablishment act was passed which provided for gradual disendowment. It is still the most numerous body, and is presided over by the bishop of Jamaica, who is also archbishop of the West Indies. The Baptists,
Wesleys, Presbyterians, Moravians and Roman Catholics are all represented; there is a Jewish synagogue at Kingston, and the Salvation Army has a branch on the island. The Church of England maintains many schools, a theological college, a deaconesses' home and an orphanage. The Baptists have a theological college; and the Roman Catholics support a training college for teachers, two industrial schools and two orphanages. Elementary education is in private hands, but fostered, since 1867, by government grants; it is free but not compulsory, although the governor has the right to compel the attendance of all children from 6 to 14 years of age in such towns and districts as he may designate. The teachers in these schools are for the most part trained in the government-aided training colleges of the various denominations. For higher education there are the University College and high school at Hope near Kingston, Potsdam School in St Elizabeth, the Mico School and Wolmer's Free School in Kingston, founded (for boys and girls) in 1729, the Montego Bay secondary school, and numerous other endowed and self-supporting establishments. The Cambridge Local Examinations have been held regularly since 1885.

History.—Jamaica was discovered by Columbus on the 3rd of May 1494. Though he called it Santiago, it has always been known by its Indian name Jaymaca, “the island of springs,” modernized in form and pronunciation into Jamaica. Excepting that in 1505 Columbus once put in for shelter, the island remained unvisited until 1509, when Diego, the discoverer's son, sent Don Juan d'Esquivel to take possession, and thenforward it passed under Spanish rule. Sant'Iago de la Vega, or Spanish Town, which remained the capital of the island until 1572, was founded in 1523. Sir Anthony Shirley, a British admiral, attacked the island in 1566, and plundered and burned the capital, but did not follow up his victory. Upon his retirement the Spaniards restored their capital and were unmolested until 1632, when the island was again raided by the British under Captain Jackson. The period of the Spanish occupation is mainly memorable for the annihilation of the gentle and peaceful Arawak Indian inhabitants; Don Pedro d'Esquivel was one of their cruelest oppressors. The whole island was divided among eight noble Spanish families, who discouraged immigration to such an extent that when Jamaica was taken by the British the white and slave population together did not exceed 3000. Under the vigorous foreign policy of Cromwell an attempt was made to crush the Spanish power in the West Indies, and an expedition under Admirals Penn and Venables succeeded in capturing and holding Jamaica in 1655. The Spanish were entirely expelled in 1658. Their slaves then took to the mountains, and down to the end of the 18th century the dissipation of these Maroons, as they were called, caused constant trouble. Jamaica continued to be governed by military authority until 1661, when Colonel D'Oyley was appointed captain-general and governor-in-chief with an executive council, and a constitution was introduced resembling that of England. He was succeeded in the next year by Lord Windsor, under whom a legislative council was established. Jamaica soon became the chief resort of the buccaneers, who not infrequently united the characters of merchant or planter with that of pirate or privateer. By the Treaty of Madrid, 1670, the British title to the island was recognized, and the buccaneers were suppressed. The Royal African Company was formed in 1672 with a monopoly of the slave trade, and from this time Jamaica was one of the greatest slave marts in the world. The sugar-industry was introduced about this period, the first pot of sugar being sent to London in 1673. An attempt was made in 1678 to saddle the island with a yearly tribute to the Crown and to restrict the free legislation. The privileges of the legislative assembly, however, were restored in 1682; but not till 46 years later was the question of revenue settled by a compromise by which Jamaica undertook to send £50,000 (to be paid in 24 equal annual installments) to the Crown, provided that English statute laws were made binding in Jamaica.

During these years of political struggle the colony was thrice afflicted by nature. A great earthquake occurred in 1692, when the chief part of the town of Port Royal, built on a shelving bank of sand, slipped into the sea. Two dreadful hurricanes devastated the island in 1712 and 1722, the second of which did so much damage that the seat of commerce had to be transferred from Port Royal to Kingston.

The only prominent event in the history of the island during the later years of the 18th century, was the threatened invasion by the French and Spanish in 1782, but Jamaica was saved by the victory of Rodney and Hood off Dominica. The last attempt at invasion was made in 1806, when the French were defeated by Admiral Duckworth. When the slave trade was abolished the island was at the zenith of its prosperity; sugar, coffee, cocoa, pimento, ginger and indigo were being produced in large quantities, and it was the depot of a very lucrative trade with the Spanish main. The anti-slavery agitation in Great Britain found its echo in the island, and in 1832 the negroes revolted, believing that emancipation had been granted. They killed a number of whites and destroyed a large amount of valuable property. Two years later the Emancipation Act was passed, and, subject to a short term of apprenticeship, the slaves were free. Emancipation left the planters in a pitiable condition financially. The British government awarded them compensation at the rate of £19 per slave, the market value of slaves at the time being £35, but most of this compensation went into the hands of the planters' creditors. They were left with over-worked estates, a poor market and a scarcity of labour. Nor was this the end of their misfortunes. During the slavery times the British government had protected the planter by imposing a heavy differential duty on foreign sugar; but on the introduction of free trade the price of sugar fell by one-half and reduced the profits of the already impoverished planter. Many estates, already heavily mortgaged, were abandoned, and the trade of the island was at a standstill.

Differences between the executive, the legislature, and the home government, as to the means of redressing the losses of the planter of the American War, created much acrimony. Although some slight improvement marked the administration of Sir Charles Metcalfe and the earl of Elgin, when coolie immigration was introduced to supply the scarcity and irregularity of labour and the railway was opened, the improvement was not permanent. In 1865 Edward John Eyre became governor. Financial affairs were at their lowest ebb and the colonial treasury showed a deficit of £50,000. To meet this difficulty new taxes were imposed and discontent was rife among the negroes. Dr Underhill, the secretary of a Baptist organization known as the British Union, wrote to the colonial secretary in London, pointing out the state of affairs. This letter became public in Jamaica, and in the opinion of the governor added in no small measure to the popular excitement. On the 11th of October 1865 the negroes rose at Morant Bay and murdered the custos and most of the white inhabitants. The slight encounter which followed filled the island with terror, and there is no doubt that many excesses were committed on both sides. The Assembly passed an act by which martial law was proclaimed, and the legislature passed an act abrogating the constitution.

The action of Governor Eyre, though generally approved throughout the West Indies, caused much controversy in England, and he was recalled. A prosecution was instituted against him, resulting in an elaborate exposition of martial law by Chief Justice Cockburn, but the jury threw out the bill and Eyre was discharged. He was succeeded in the government of Jamaica by Sir Henry Storks, and under the crown colony system of government the state of the island made slow but steady progress. In 1868 the first fruit shipment took place from Port Antonio, the immigration of coolies was revived, and cinchona planting was introduced. The method of government was changed in 1884, when a new constitution, slightly modified in 1893, was granted to the island.
Sir James Ferguson, 6th baronet (b. 1832). The principal shock was followed by many more of lighter intensity during the ensuing fortnight and later. On the 17th of January assistance was brought by three American war-ships under Rear-Admiral Davis, who however withdrew them on the 19th, owing to a misunderstanding with the governor of the island, Sir Alexander Swettenham, on the subject of the landing of marines from the vessels with a view to preserving order. The incident caused considerable sensation, and led to Sir A. Swettenham's resignation in the following March, Sir Sydney Olivier, K.C.M.G., being appointed governor. Order was speedily restored; but the destructive effect of the earthquake was a severe check to the prosperity of the island.

JAMAICA, formerly a village of Queens county, Long Island, New York, U.S.A., but after the 1st of January 1808 a part of the borough of Queens, New York City. Pop. (1890) 53,616. It is served by the Long Island railroad, the lines of which from Brooklyn and Manhattan meet here and then separate to serve the different regions of the island. King's Park (about 10 acres) comprises the estate of John Alsop King (1788–1867), governor of New York in 1857–1859, from whose heirs in 1897 the land was purchased by the village trustees. In South Jamaica there is a race track, at which meetings are held in the spring and autumn. The headquarters of the Queens Borough Department of Public Works and Police are in the Jamaica town-hall, and Jamaica is the seat of a city training school for teachers (until 1905 known as the New York State normal school). For two nouns, a coat, and a quantity of powder and lead, several New Englanders obtained from the Indians a deed for a tract of land here in September 1655. In March 1657 they received permission from Governor Stuyvesant to found a town, which was chartered in 1660 and was named Rustdorp by Stuyvesant, but the English called it Jamaica; it was rechartered in 1666, 1686 and 1788. The village was incorporated in 1814 and reincorporated in 1855. In 1665 it was made the seat of justice of the north riding; in 1683–1788 it was the shire town of Queens county. With Hempstead, Gravesend, Newtown and Flushing, also towns of New England origin and type, Jamaica was early disaffected towards the provincial government of New York. In 1699 these towns complained that they had no representation in a popular assembly, and in 1670 they protested against taxation without representation. The founders of Jamaica were mostly Presbyterians, and they organized one of the first Presbyterian churches in America. At the beginning of the War of Independence Jamaica was under the control of Loyalists; after the defeat of the Americans in the battle of Long Island (27th August 1776) it was occupied by the British; and until the end of the war it was the headquarters of General Oliver DeLancy, who commanded all of Long Island.

JAMB (from fr. jamb, leg), in architecture, the side-post or lining of a doorway or other aperture. The jambs of a window outside the frame are called "revels." Small shafts to doors and windows with caps and bases are known as "jamb-shafts"; when in the inside arris of the jamb of a window they are sometimes called "scionson ."

JAMES (a variant of the name Jacob, Heb. יואל, one who holds by the heel, outwitter, through O. Fr. James, another form of Jacques, Jaques, from Low Lat. Jacobus; cf. It. Jacopo).

1 In June 1908 the subway lines of the interborough system of New York City were extended to the Flatbush (Brooklyn) station of the Long Island railroad, thus bringing Jamaica into direct connexion with Manhattan borough by way of the East river tunnel, completed in the same year.
JAMES I. (1566–1625), king of Great Britain and Ireland, formerly king of Scotland as James VI., was the only child of Mary Queen of Scots, and her second husband, Henry Stewart Lord Darnley. He was born in the castle of Edinburgh on the 19th of June 1566, and was proclaimed king of Scotland on the 24th of July 1567, upon the forced abdication of his mother. Until 1578 he was treated as being incapable of taking any real part in public affairs, and was kept in the castle of Stirling for safety’s sake amid the confused fighting of the early years of his minority.

The young king was a very weakly boy. It is said that he could not stand without support until he was seven, and although he lived until he was nearly sixty, he was never a strong man. In after life he was a constant and even a reckless rider, but the weakness in his legs was never quite cured. During a great part of his life he found it necessary to be tied to the saddle. When on one occasion in 1621 his horse threw him into the New River near his palace of Theobalds in the neighbourhood of London, he had a very narrow escape of being drowned; yet he continued to ride as before. At all times he preferred to lean on the shoulder of an attendant while walking. This feebleness of body, which had no doubt a large share in causing certain corresponding deficiencies of character, was attributed to the agitations and the violent efforts forced on his mother by the murder of her secretary Rizzio when she was in the sixth month of her pregnancy. The fact that James was a bold rider, in spite of his serious disqualification for athletic exercise, should be borne in mind when he is accused of having been a coward.

The circumstances surrounding him in boyhood were not favourable to the development of his character. His immediate guardian or foster-father, the earl of Mar, was indeed an honourable man, and the countess, who had charge of the nursing of the king, discharged her duty so as to win his lasting confidence. James afterwards entrusted her with the care of his eldest son, Henry. When the earl died in 1572 his place was well filled by his brother, Sir Alexander Erskine. The king’s education was placed under the care of George Buchanan, assisted by Peter Young, and two other tutors. Buchanan, who did not spare the rod, and the other teachers, who had more reverence for the royal person, gave the boy a sound training in languages. The English envoy, Sir Henry Killigrew, who saw him in 1574, testified to his proficiency in translating from and into Latin and French. As it was very desirable that he should be trained a Protestant, he was well instructed in theology. The exceptionally scholastic quality of his education helped to give him a taste for learning, but also tended to make him a pedant.

James was only twelve when the earl of Morton was driven from the regency, and for some time after he can have been no more than a puppet in the hands of intriguing and party leaders. When, for instance, in 1582 he was seized by the faction of nobles who carried out the so-called raid of Ruthven, which was in fact a kidnapping enterprise carried out in the interest of the Protestant party, he cried like a child. One of the conspirators, the master of Glamis, Sir Thomas Lyon, told him that it was better “bairns should greet [children should cry] than bearded men.” It was not indeed till 1583, when he broke away from his captors, that James began to govern in reality. For the history of his reign reference may be made to the articles on the histories of England and Scotland. James’s work as a ruler can be divided, without violating any sound rule of criticism, into black and white—into the part which was a failure and a preparation for future disaster, and the part which was solid achievement, honourable to himself and profitable to his people. His native kingdom of Scotland had the benefit of the second. Between 1583 and 1603 he reduced the anarchical baronage of Scotland to obedience, and replaced the subdivision of sovereignty and consequent confusion, which had been the very essence of feudalism, by a strong centralized royal authority. In fact he did in Scotland what work which had been done by the Tudors in England, by Louis XI. in France, and by Ferdinand and Isabella in Spain. It was the work of all the strong rulers of the Renaissance. But James not only...
brought his disobedient and intriguing barons to order—that was a comparatively easy achievement and might well have been performed by more than one of his predecessors, had their lives been prolonged—he also quelled the attempts of the Protestants to found what Hallam has well defined as a "Presbyterian Hildebrandism." He enforced the superiority of the state over the church. Both before his accession to the throne of England (1603) and afterwards he took an intelligent interest in the prosperity of his Scottish kingdom, and did much for the pacification of the Hebrides, for the enforcement of order on the Borders, and for the development of industry. That he did so much although the crown was poor (largely it must be confessed because he made profuse gifts of the secularized church lands), and although the armed force at his disposal was so small that to the very end he was exposed to the attacks of would-be kidnappers (as in the case of that personal appearance of 1600), is proof positive that he was neither the mere polo troon nor the mere learned fool he often has been called.

James's methods of achieving ends in themselves honourable and profitable were indeed of a kind which has made posterity unjust to his real merits. The circumstances in which he passed his youth developed in him a natural tendency to craft. He boasted indeed of his "king-craft" and probably believed that he owed it to his studies. But it was in reality the resource of the weak, the art of playing off one possible enemy against another by trickery, and so deceiving all. The marquis de Fontenay, the French ambassador, who saw him in the early part of his reign, speaks of him as cowed by the violence about him. It is certain that James was most unscrupulous in making promises which he never meant to keep, and the terror in which he passed his youth sufficiently explains his preference for guile. He would make promises to everybody, as when he wrote to the pope in 1584 more than hinting that he would be a good Roman Catholic if helped in need. His very natural desire to escape from the poverty and insecurity of Scotland to the opulent English throne not only kept him busy in intrigues to placate the Roman Catholics or anybody else who could help or hinder him, but led him to behave basely in regard to the execution of his mother in 1587. He blustered to give himself an air of courage, but took good care to do nothing to offend Elizabeth. When the time came for fulfilling his promises and half-promises, he was not able, even if he had been willing, to keep his word to everybody. The methods which had helped him to success in Scotland did him harm in England, where his reign prepared the way for the great civil war. In his southern kingdom his failure was in fact complete. Although England accepted him as the alternative to civil war, and although he was received and surrounded with fulsome flattery, he did not win the respect of his English subjects excepting indeed the palatines, who were so made his garrulity, his Scottish accent, his slovenliness and his toleration of disorders in his court, but, above all, his fever for handsome male favourites, whom he loaded with gifts and caressed with demonstrations of affection which laid him open to vile suspicions. In ecclesiastical matters he offended many, who contrasted his severity and rudeness to the Puritan divines at the Hampton Court conference (1604) with his politeness to the Roman Catholics, whom he, however, worried by fits and starts. In a country where the authority of the state had been firmly established and the problem was how to keep it from degenerating into the mere instrument of a king's passions, his insistence on the doctrine of divine right aroused distrust and hostility. In itself, and in its origin, the doctrine was nothing more than a necessary assertion of the independence of the state in face of the "Hildebrandism" of Rome and Geneva alike. But when, as in England, it was used to the king's advantage, and the feasible rights and that all the privileges of subjects were revocable gifts, they were roused to hostility. His weaknesses cast suspicion on his best-meant schemes. His favour for his countrymen helped to defeat his wise wish to bring about a full union between England and Scotland. His profusion, which had been bad in the poverty of Scotland and was boundless amid the wealth of England, kept him incessant, and drove him to shifts. Posterity can give him credit for his desire to forward religious peace in Europe, but his Protestant subjects were simply frightened when he sought a matrimonial alliance with Spain. Sagacious men among his contemporaries could not see the consistency of a king who married his daughter Elizabeth to the elector palatine, a leader of the German Protestants, and also sought to marry his son to an infanta of Spain. The king's subservience to Spain was indeed almost besotted. He could not see her real weakness, and he allowed himself to be befooled by the ministers of Philip III. and Philip IV. The end of his scheming was that he was dragged into a needless war with Spain by his son Charles and his favourite George Villiers, duke of Buckingham, just before his death on the 5th of March 1625 at his favourite residence, Theobalds.

James married in 1589 Anne, second daughter of Frederick II., king of Denmark. His voyage to meet his bride, whose ship had been driven into a Norwegian port by bad weather, is the only episode of a romantic character in the life of this very prosaic member of a poetic family. By this wife James had three children who survived infancy: Henry Frederick, prince of Wales, who died in 1612; Charles, the future king; and Elizabeth, wife of the elector palatine, Frederick V.

Not the least of James's many ambitions was the desire to excel as an author. He left a body of writings which, though of mediocre quality as literature, entitle him to a unique place among English kings since Alfred for width of intellectual interest and literary faculty. His efforts were inspired by his preceptor George Buchanan, whose memory he cherished in later years. His first work was in verse, Essays of a Pretence in the Divine Art of Poesy (Edin. Vautrollier, 1584), containing fifteen sonnets, "Ae Metaphorical invention of a tragedie called Phoenix," a short poem "Of Time," translations from Du Bartas, Lucan and the Book of Psalms ("out of Tremellious"), and a prose tract entitled "Ane short treatise, containing some Reulys and Cautelous to be observt and eschewt in Scottis Poesye." The volume is introduced by commendatory sonnets, including one by Alexander Montgomerie. The chief interest of the book lies in the "Treatise" and the prefatory sonnets "To the Reader" and "Sonnet decyfig the perfyte poete." There is little originality in this youthful production. It has been surmised that it was compiled from the exercises written when the author was Buchanan's pupil at Stirling, and that it was directly suggested by his preceptor's De Prosodia and his annotations on Vives. On the other hand, it shows intimate acquaintance with the critical reflections of Ronsard and Du Bellay, and of Gascoigne in his Notes of Instruction (1573). In 1591 James published Poetical Exercises at Vacant Hours, including a translation of that of Du Bartas, his own Lepante, and Du Bartas's version of it, La Lepantade. His Daemonologie, a prose treatise denouncing witchcraft and exhorting the civil power to the strongest measures of suppression, appeared in 1599. In the same year he printed the first edition (seven copies) of his Basilikon Doron, strongly Protestant in tone. A French edition, specially translated for presentation to the pope, has a disingenuous preface explaining that certain phrases (e.g. "papistical doctrine") are omitted, because of the difficulty of rendering them in a foreign tongue. The original edition was, however, translated by order of the suspicious pope, and was immediately placed on the Index. Shortly after going to England James produced his famous Counterblaste to Tobacco (London, 1604), in which he forsakes his Scots tongue for Southern English. The volume was published anonymously. James's prose works (including his speeches) were collected and edited (folio, 1616) by James Montagu, bishop of Winchester, and were translated into French by the Marquis de Vautrollier, in a companion folio, in 1619 (also London). A tract, entitled "The True Law of Free Monarchies," appeared in 1603; "An Apology for the Oath of Allegiance" in 1607; and a "Déclaration du Roy Jacques," I., for the droit des Rois" in 1615. In 1588 and 1589 James issued two small volumes of Meditationes on some verses of (a) Revelations and (b) 1 Chronicles. Other two "meditations" were printed posthumously.
JAMES II.

For primary work, see Edward Arber's reprint of the Essays and Counterblaste ("English Reprints", 1866, &c.); R. S. Rait's Lusus Regum (1900); G. Gregory Smith's Elisabethan Critical Essays (1904), vol. i., where the Treatise is edited for the first time; A. O. H. Siemon’s Forschungen (Preuss. Hist. Inst.), iii. for an account of the issues of the Basilikon Doron; F. Hume Brown’s George Buchanan (1890), pp. 250–261, for a sketch of James's association with Buchanan.

JAMES II. (1633–1701), king of Great Britain and Ireland, second surviving son of Charles I. and Henrietta Maria, was born at St James’s on the 15th of October 1633, and created duke of York in January 1643. During the Civil War James was taken prisoner by Fairfax (1646), but contrived to escape to Holland in 1648. Subsequently he served in the French army under Turenne, and in the Spanish under Condé, and was applauded by both commanders for his brilliant personal courage. Returning to England with Charles II. in 1660 he was appointed lord high admiral and warden of the Cinque Ports. Pepys, who was secretary to the navy, has recorded the patient industry and unflinching probity of his naval administration. His victory over the Dutch in 1665, and his drawn battle with De Ruyter in 1672, show that he was a good naval commander as well as an excellent administrator. These achievements won him a reputation for high courage, which, until the close of 1688, was amply deserved. His private record was not as good as his public. In December 1660 he admitted to having contracted, under discreditless circumstances, a secret marriage with Anne Hyde (1646–1671), daughter of Lord Clarendon, in the previous September. Both before and after the marriage he seems to have been a libertine as unblushing though not so fastidiously as Charles himself. In 1672 he made a public avowal of his conversion to Roman Catholicism. Charles II. had opposed this project, but in 1673 allowed him to marry the Catholic Mary of Modena as his second wife. Both houses of parliament, who viewed this union with abhorrence, now passed the Test Act, forbidding Catholics to hold office. In consequence of this James was forced to resign his posts. It was in vain that he married his daughter Mary to the Protestant prince of Orange in 1677. Anti-Catholic feeling ran so high that, after the discovery of the Popish Plot, he found it wiser to retire to Brussels (1679), while Shaftesbury and the Whigs planned to exclude him from the succession. He was lord high commissioner of Scotland (1685–1688), and was elected himself, in a severe persecution, of the Covenanters. In 1684, Charles, having triumphed over the Exclusionists, restored James to the office of high admiral by use of his dispensing power.

James ascended the throne on the 16th of February 1685. The nation showed its loyalty by its firm adherence to him during the rebellions of Argyll in Scotland and Monmouth in England (1685). The savage reprisals on their suppression, in especial the "Bloody Assizes" of Jeffreys, produced a revulsion of public feeling. James had promised to defend the existing Church and government, but the people now became suspicious. James was not a martyrant and bigot, as the popular imagination speedily assumed him to be. He was rather a mediocre but not altogether obtuse man, who mistook tributary streams for the main currents of national thought. Thus he greatly underrated the strength of the Dissenters, and was appalled at the reaction of Dissent and Catholicism. He perceived that opinion was seriously divided in the Established Church, and thought that a vigorous policy would soon prove effective. Hence he publicly celebrated Mass, prohibited preaching against Catholicism, and showed exceptional favour to renegades from the Establishment. By undue pressure he secured a decision of the judges, in the test case of Godden v. Hale (1687), by which he was allowed to dispense Catholics from the Test Act. Catholics were now admitted to the chief offices in the army, and to some important posts in the state, in virtue of the dispensing power of James. The judges had been intimidated or corrupted, and the royal promise to protect the Establishment violated. The army had been increased to 20,000 men and encamped at Hounslow Heath to overawe the capital. Public alarm was speedily manifested and suspicion to a high degree awakened. In 1687 James made a bid for the support of the Dissenters by advocating a system of joint toleration for Catholics and Dissenters. In April 1687 he published a Declaration of Indulgence—exempting Catholics and Dissenters from penal statutes. He followed up this measure by dissolving parliament and attacking the universities. By an unscrupulous use of the dispensing power he introduced Dissenters and Catholics into all departments of state and into the municipal corporations, which were remodelled in their interests. Then in April 1688 he took the suicidal step of issuing a proclamation to force the clergy and bishops to read the Declaration in their pulpits, and thus personally advocate a measure they detested. Seven bishops refused, were indicted by James for libel, but acquitted amid the indescribable enthusiasm of the populace. Protestant nobles of England, enraged at the tolerant policy of James, had been in negotiation with William of Orange since 1687. The trial of the seven bishops, and the birth of a son to James, now induced them to send William a definite invitation (June 30, 1688). James remained in a fool's paradise till the last, and only awakened to his danger when William landed at Torbay (November 5, 1688) and swept all before him. James pretended to treat, and in the midst of the negotiations fled to France. He was intercepted at Faversham and brought back, but the politic prince of Orange allowed him to escape a second time (December 23, 1688).

At the end of 1688 James seemed to have lost his old courage. After his defeat at the Boyne (July 1, 1690) he speedily departed from Ireland, where he had so conducted himself that his English followers had been ashamed of his incapacity, while French officers had derided him. His proclamations and policy towards England during these years show unmistakable traces of the same incompetence. On the 17th of May 1692 he saw the French fleet destroyed before his very eyes off Cape La Hogue. He was aware of, though not an open advocate of the "Assassination Plot," which was directed against William. By its revelation and failure (February 10, 1696) the third and last serious attempt of James for his restoration failed. He refused in the same year to accept the French influence in favour of his candidate to the Polish throne, on the ground that it would exclude him from the English. Henceforward he neglected politics, and Louis of France ceased to consider him as a political factor. A mysterious conversion had him affected in a Jesuit context, and he became a Jesuit. The world saw with astonishment this vicious, rough, coarse-libed man of the world transformed into an austere penitent, who worked miracles of healing. Surrounded by this odour of sanctity, which greatly edified the faithful, James lived at St Germain until his death on the 17th of September 1701.

The political ineptitude of James is clear; he often showed firmness when conciliation was needful, and weakness when resolution alone could have saved the day. Moreover, though he mismanaged almost every political problem with which he personally dealt, he was singularly tactless and impatient of advice. But in general political morality he was not below his age, and in his advocacy of toleration decidedly above it. He was more honest and sincere than Charles II., more genuinely patriotic in his foreign policy, and more consistent in his religious attitude. That his brother retained the throne while James lost it is a most ironical demonstration of the truth that a more pitless fate awaits the ruler whose faults are of the intellect, than one whose faults are of the heart.

By Anne Hyde James had eight children, of whom two only, Mary and Anne, both queens of England, survived their father. By Mary of Modena he had seven children, among them being James Francis Edward (the Old Pretender) and Louisa Maria Theresa, who died at St Germain in 1712. By one mistress, Arabella Churchill (1648–1730), he had two sons, James, duke of Berwick, and Henry (1673–1702), titular duke of Albermarle and
James I.—II. of Scotland 139

James I. (1394–1437), king of Scotland and poet, the son of King Robert III., was born at Dunfermline in July 1395. After the death of his mother, Annabella Drummond of Stobo, in 1402, he was placed under the care of Henry Wardlaw (d. 1440), who became bishop of St Andrews in 1403, but soon his father resolved to send him to France. Robert doubtless decided upon this course owing to the fact that in 1402 his elder son, David, duke of Rothesay, had met his death in a mysterious fashion, being probably murdered by his uncle, Robert, duke of Albany, who, as the king was an invalid, was virtually the ruler of Scotland.

On the way to France, however, James fell into the hands of some English sailors and was sent to Henry IV., who refused to admit him to ransom. The chronicler Thomas Walsingham, says that James's imprisonment began in 1406, while the future king himself places it in 1404; February 1406 is probably the correct date. On the death of Robert III. in April 1406 James became nominally king of Scotland, but he remained a captive in England, the government being conducted by his uncle, Robert of Albany, who showed no anxiety to procure his nephew's release. Dying in 1430, Albany was succeeded as regent by his brother, Murdoch. At first James was confined in the Tower of London, but in June 1407 he was removed to the castle at Nottingham, whence about a month later he was taken to Evesham. His education was continued by capable tutors, and he not only attained excellence in all many sports, but became perhaps more cultured than any other prince of his age. In person he was short and stout, but well-proportioned and very strong. His agility was not less remarkable than his strength; he excelled in all athletic feats which demanded suppleness of limb and quickness of eye. As regards his intellectual attainments he is reported to have been acquainted with philosophy, and it is evident from his subsequent career that he had studied jurisprudence; moreover, besides being proficient in vocal and instrumental music, he cultivated the art of poetry with much success. When Henry V. became king in March 1413, James was again imprisoned in the Tower of London, but soon afterwards he was taken to Windsor and was treated with great consideration by the English king. In 1420, with the intention of detaching the Scottish auxiliaries from the French standard, he was sent to take part in Henry's campaign in France. This attempt failed in the first instance and James returned to England after Henry's death in 1422. About this time negotiations for the release of James were begun in earnest, and in September 1423 a treaty was signed at York, the Scottish nation undertaking to pay a ransom of 60,000 marks "for his maintenance in England."

By the terms of the treaty James was to wed a noble English lady, and on the 12th of February 1424 he was married at Southwark to Jane, daughter of John Beaufort, earl of Somerset, a lady to whom he was faithful through life. Ten thousand marks of his ransom were remitted as Jane's dowry, and in April 1424 James and his bride entered Scotland.

With the reign of James I., whose coronation took place at Scone on the 21st of May 1424, constitutional sovereignty may be said to begin in Scotland. By the introduction of a system of statute law, modelled to some extent on that of England, and by the additional importance assigned to parliament, the levies was prepared which was to work towards the destruction of the indefinite authority of the king and of the unbridled licentiousness of nobles. During the parliament held at Perth in March 1427 James arrested Murdoch, duke of Albany, and his son, Alexander; together with Albany's eldest son, Walter, and Duncan, earl of Lennox, who had been seized previously; they were sentenced to death, and the four were executed at Stirling. In a parliament held at Inverness in 1427 the king arrested many turbulent northern chiefs, and his whole policy was directed towards crushing the power of the nobles. In this he was very successful. Expeditions reduced the Highlands to order; earldom after earldom was forfeited; but this vigour aroused the desire for revenge, and at length cost James his life. Having been warned that he would never again cross the Firth, the king went to reside in Perth just before Christmas 1436. Among those whom he had angered was Sir Robert Graham (d. 1437), who had been banished by his orders. Instigated by the king's uncle, Walter Stewart, earl of Atholl (d. 1437), and aided by the royal chamberlain, Sir Robert Stewart, and by a band of Highlanders, Graham burst into the presence of James on the night of the 20th of February 1437 and stabbed the king to death. Graham and Atholl were afterwards executed. He had left two sons; Alexander, who died young, and James II., who succeeded to the throne; and six daughters, among them being Margaret, the queen of Louis XI. of France. His widow, Jane, married Sir James Stewart, the "black knight of Lorne," and died on the 15th of July 1445.

During the latter part of James's reign difficulties arose between Scotland and England and also between Scotland and the papacy. Part of the king's ransom was still owing to England; other causes of discord between the two nations existed, and in 1436 these culminated in a short war. In ecclesiastical matters James showed himself merciless towards heretics, but his desire to reform the Scottish Church and to make it less dependent on Rome brought him into collision with Popes Martin V. and Eugenius IV.

James was the author of two poems, the Kingis Quair and Good Counsel (a short piece of three stanzas). The Song of Absence, Pebis to the Play and Christis Kirk on the Greene have been ascribed to him, but without any evidence. The Kingis Quair is preserved in the Selden MS. B. in the Bodleian Library as an allegorical poem of the cours d'amour type, written in seven-lined Chaucerian stanzas and extending to 1379 lines. It was composed during James's captivity in England and celebrates his courtship of Lady Jane Beaufort. Though in many respects a Chaucerian pastiche, it not rarely equals its model in verbal and metrical felicity. Its language is an artificial blend of northern and southern (Chaucerian) forms, of the type shown in Lancelot of the Lake and the Quair of Jelusy.

Laing (Edinburgh, 1872–1879); and Walter Bower's continuation of John of Fordun, The Complaynt of Scotland, ed. B. H. Hearne (Oxford, 1722). See also J. Pinkerton, History of Scotland (1797); A. Lang, History of Scotland, vol. i. (1900); and G. Burnett, Introduction to the Exchequer Rolls of Scotland (Edinburgh, 1878–1903). The Kingis Quair was first printed in the Poetical Remains of James the First, edited by William Tytler (1783). Later editions are Morison's reprint (Perth, 1786); J. Sibbald's, in his Chronicles of Scottish Poetry (1802, vol. i.); Thomson's in 1815 and 1824; G. Chalmers's, in his Poetical Remains of some of the Scottish Kings (1824); Rogers's Poetical Remains of King James the First (1837); Skeat's edition published by the Scottish Text Society (1884). An attempt has been made to dispute James's authorship of the poem, but the arguments elaborated by C. J. Morison (in The Accident of James IV. (Edinburgh, 1890) have been conclusively answered by J. A. Bruyere in its Jacobs 1er d’Ecosse fut-il poète? Etude sur l'autenticité du cahier du roi (Paris, 1897, reprinted from the Revue historique, vol. lxiv.). See also the full correspondence between the Duke of Roxburghe and Dr. W. A. Neilson, Origins and Sources of the Court of Love (Boston, 1890), pp. 152 &c., 235 &c.; and Gregory Smith, Transition Period (1900), pp. 40, 41.

James II. (1430–1460), king of Scotland, the only surviving son of James I. and his wife, Jane, daughter of John Beaufort, earl of Somerset, was born on the 16th of October 1430. Crowned
JAMES III.—IV. OF SCOTLAND

King at Holyrood in March 1437, shortly after the murder of his father, he was at first under the guardianship of his mother, while Archibald, 5th earl of Douglas, was regent of the kingdom, and considerable power was possessed by Sir Alexander Livingstone and Sir William Crichton (d. 1454). When about 1439 Queen Jane was married to Sir James Stewart, the knight of Lorne, Livingstone obtained the custody of the young king, whose minority was marked by fierce hostility between the Douglases and the Crichtons, with Livingstone first on one side and then on the other. About 1443 the royal cause was espoused by William, 8th earl of Douglas, who attacked Crichton in the king’s name, and civil war lasted until about 1446. In July 1449 James was married to Mary (d. 1463), daughter of Arnold, Duke of Gelderland, and undertook the government himself; and almost immediately Livingstone was arrested, but Douglas retained the royal favour for a few months more. In 1452, however, this powerful earl was invited to Stirling by the king, and, charged with treachery, was stabbed by James and then killed by the attendants. Civil war broke out at once between James and the Douglases, whose lands were ravaged; but after the Scots parliament had exonerated the king, James, the new earl of Douglas, had made his submission. Early in 1455 the struggle was renewed. Marching against the rebels James gained several victories, after which Douglas was attainted and his lands forfeited. Fortified by this success and assured of the support of the parliament and of the great nobles, James, acting as an absolute king, could view without alarm the war which had broken out with England. After two expeditions across the borders, a truce was made in July 1457, and the king employed the period of peace in strengthening his authority in the Highlands. During the Wars of the Roses he showed his sympathy with the Lancastrian party after the defeat of Henry VI. at Northampton by attacking the English possessions to the south of Scotland. It was while conducting the siege of Roxburgh Castle that James was killed, through the bursting of a cannon, on the 3rd of August 1460. He left three sons, his successor, James III., Alexander Stewart, duke of Albany, and John Stewart, earl of Mar (d. 1479); and two daughters. James, who is sometimes called “Fiery Face,” was a vigorous and popular prince, and, although not a scholar like his father, showed interest in the arts, and his reign is looked upon as an epoch in the legislative history of Scotland, as measures were passed with regard to the tenure of land, the reformation of the coinage, and the protection of the poor, while the organization for the administration of justice was greatly improved.

JAMES III. (1451–1488), king of Scotland, eldest son of James II., was born on the 10th of July 1451. Becoming king in 1460 he was crowned at Kelso. After the death of his mother in 1463, and of her principal supporter, James Kennedy, Bishop of St Andrews, two years later, the person of the young king, and with it the chief authority in the kingdom, were seized by Sir Alexander Boyd and his brother Lord Boyd, while the latter’s son, Thomas, was created earl of Arran and married to the king’s sister, Mary. In July 1460 James himself was married to Margaret (d. 1486), daughter of Christian I., king of Denmark and Norway, but before the wedding the Boyds had lost their power. Having undertaken the government in person, the king received the submission of the powerful earl of Ross, and strengthened his authority in other ways. But his preference for a sedentary life and not for an active life, and his increasing attachment to favourites of humble birth diminished his popularity, and caused him to have some differences with his parliament. About 1470, probably with reason both suspicious and jealous, James arrested his brothers, Alexander, Duke of Albany, and John, earl of Mar; Mar met his death in a mysterious fashion at Craigmillar, but Albany escaped to France and then visited England, where in 1482 Edward IV. recognized him as king of Scotland by the gift of the king of England. War broke out with England, but James, made a prisoner by his nobles, was unable to prevent Albany and his ally, Richard, Duke of Gloucester (afterwards Richard III.), from taking Berwick and marching to Edinburgh. Peace with Albany followed, but soon afterwards the duke was again in communication with Edward, and was condemned by the parliament after the death of the English king in April 1483. Albany’s death in France in 1485 did not end the king’s troubles. His policy of living at peace with England and of arranging marriages between the members of the royal families of the two countries did not commend itself to the turbulent section of his nobles; his artistic tastes and lavish expenditure added to the discontent, and a rebellion broke out. Fleeting into the north of his kingdom James collected an army and came to terms with his foes; but the rebels, having seized the person of the king’s eldest son, afterwards James IV., renewed the struggle. The rival armies met at the Sauchieburn near Bannockburn, and James soon fled. Reaching Beaton’s Mill he revealed his identity, and, according to the popular story, was killed on the 11th of June 1488 by a soldier in the guise of a priest who had been called in to shrieve him. He left three sons—his successor, James IV.; James Stewart, Duke of Ross, afterwards Archbishop of St Andrews, and John Stewart, Earl of Mar. James was a cultured prince with a taste for music and architecture, but was a weak and incapable king. His character is thus described by a chronicler: He was an item that loved solitude, and desired never to hear of war or peace, but devoted himself to a life of peace and building and he did the government of the realm.”

JAMES IV. (1473–1513), king of Scotland, eldest son of James III., was born on the 17th of March 1473. He was nominally the leader of the rebels who defeated the troops of James III. at the Sauchieburn in June 1488, and became king when his father was killed. As he adopted an entirely different policy with the nobles from that of his father, and, moreover, showed great affability towards the lower class of his subjects, among whom he delighted to wander incognito, few if any of the kings of Scotland have won such general popularity, or passed a reign so untroubled by intestine strife. Crowned at Scone a few days after his accession, James began at once to take an active part in the business of government. A slight insurrection was easily suppressed, and a plot formed by some nobles to hand him over to the English king, Henry VII., came to nothing. In spite of this proceeding Henry wished to live at peace with his northern neighbour, and soon contemplated marrying his daughter to James, but the Scottish king was not equally pacific. When, in 1505, he had married Margaret,pretended to be the Duke of York, Edward IV.’s younger son, came to Scotland and was bestowed upon him both an income and a bride, and prepared to invade England in his interests. For various reasons the war was confined to a few border forays. After Warbeck left Scotland in 1497, the Spanish ambassador negotiated a peace, and in 1502 a marriage was definitely arranged between James and Henry’s daughter Margaret (1489–1541). The wedding took place at Holyrood in August 1503, and it was this union which led to the accession of the Stewart dynasty to the English throne.

About the same time James crushed a rebellion in the western isles, into which he had previously led expeditions, and parliament took measures to strengthen the royal authority therein. At this date too, or a little earlier, the king of Scotland began to treat as an equal with the powerful princes of Europe, Maximilian I., Louis XII., and others; sending assistance to his uncle Hans, king of Denmark, and receiving special marks of favour from Pope Julius II., anxious to obtain his support. But his position was weakened when Henry VIII. followed Henry VII. on the English throne in 1509. Causes of quarrel between the two kings, and other causes, both public and private, soon arose between the two kings; sea-fights took place between their ships, while war was brought nearer by the treaty of alliance which James concluded with Louis XII. in 1512. Henry made a vain effort to prevent, or to postpone, the outbreak of hostilities; but urged on by his French ally and his queen, James declared for war, in spite of the counsels of some of his advisers, and (it is said) of the warning of an apparition. Gathering a large and well-armed force, he took Norham and other castles in August 1513, spending some time at Ford Castle, where, according to report, he was engaged in an amorous intrigue with the wife of its owner. Then
he moved out to fight the advancing English army under Thomas Howard, earl of Surrey. The battle, which took place at Flodden, or more correctly, at the foot of Branston Hill, on Friday the 9th of September 1513, is among the most famous and disastrous, if not among the most momentous, in the history of Scotland. Having led his troops from their position of vantage, the king himself was killed while fighting on foot, together with nearly all his nobles; there was no foundation for the rumour that he had escaped from the carnage. He left one legitimate child, his successor James V., but as his gallantries were numerous he had many illegitimate children, among them (by Marion Boyd) Alexander Stewart, archbishop of St Andrews and chancellor of Scotland, who was killed at Flodden, and (by Janet Kennedy) James Stewart, earl of Moray (d. 1544). One of his other mistresses was Margaret Drummond (d. 1501).

James appears to have been a brave and generous man, and a wise and energetic king. According to one account, he was possessed of considerable learning; during his reign the Scottish court attained some degree of refinement, and Scotland counted in European politics as she had never done before. Literature flourished under the royal patronage, education was encouraged, and the wealth of the country improved enormously. Prominent both as an administrator and as a lawgiver, the king by his vigorous rule did much to destroy the tendencies to independence which existed in the Highlands and Islands; but, on the other hand, his rash conduct at Flodden brought much misery upon his kingdom. He was specially interested in his navy. The tournaments which took place under his auspices were worthy of the best days of chivalry in France and England. James shared to the full in the superstitions of the age which was quickly passing away. He is said to have worn an iron belt as penance for his share in his father's death; and by his frequent visits to shrines, and his benefactions to religious foundations, he won a reputation for piety.

JAMES V. (1512-1542), king of Scotland, son of James IV., was born at Linlithgow on the 10th of April 1512, and became king when his father was killed at Flodden in 1513. The regency was at first vested in his mother, but after Queen Margaret's second marriage, with Archibald Douglas, 6th earl of Angus, in August 1514, it was transferred by the estates to John Stewart, duke of Albany. Hereforward the minority of James was disturbed by constant quarrels between a faction, generally favourable to England, under Angus, and the partisans of France under Albany; while the queen-mother and the nobles struggled to gain and to regain possession of the king's person. The English had not followed up their victory at Flodden, although there were as usual forays on the borders, but Henry VIII. was watching affairs in Scotland with an observant eye, and other European sovereigns were not indifferent to the possibility of a Scotch alliance. In 1524, when Albany had retired to France, the parliament declared that James was fit to govern, but that he must be advised by his mother and a council. This "erection" of James as king was mainly due to the efforts of Henry VIII. In 1526 Angus obtained control of the king, and kept him in close confinement until 1528, when James, escaping from Edinburgh to Stirling, put vigorous measures in execution against the earl, and compelled him to flee to England. In 1530 and 1531 the king made a strong effort to suppress his turbulent vassals in the Scottish lands and after an unsuccessful attempt to make peace with England, he abdicated in his favor, and in May 1534 a treaty was signed. At this time, as on previous occasions, Henry VIII. wished James to marry his daughter Mary, while other ladies had been suggested by the emperor Charles V.; but the Scottish king, preferring a French bride, visited France, and in January 1537 was married at Paris to Madeleine, daughter of King Francis I. Madeleine died soon after her arrival in Scotland, and in 1538 James made a much more important marriage, being united to Mary (1535-1560), daughter of Claude, duke of Guise, and widow of Louis of Orleans, duke of Longueville. It was this connexion, probably, which finally induced James to forsake his vacillating foreign policy, and to range himself definitely among the enemies of England.
Mahommedan princes of Valencia. On the 28th of September 1238 the town of Valencia surrendered, and the whole territory was conquered in the ensuing years. Like all the princes of his house, James took part in the politics of southern France. He endeavoured to form a southern state on both sides of the Pyrenees, which should counterbalance the power of France north of the Loire. Here also his policy failed against physical, social and political obstacles. As in the case of Navarre, he was too wise to launch into perilous adventures. By the Treaty of Corbeil, with Louis IX., signed the 11th of May 1258, he frankly withdrew from conflict with the French king, and contented himself with the recognition of his position, and the surrender of antiquated French claims to the lordship of Catalonia. During the remaining twenty years of his life, James was much concerned in warring with the Moors in Murcia, not on his own account, but on behalf of his son-in-law Alphonso the Wise of Castile. As a legislator and organizer he occupies a high place among the Spanish kings. He would probably have been more successful but for the confusion caused by the disputes in his own household. James, though orthodox and pious, had an ample share of moral laxity. After repudiating Leonora of Castile he married Violante (in Spanish Violante), daughter of Andrew II. of Hungary, who had a considerable influence over him. But she could not prevent him from continuing a long series of intrigues. The favour he showed his bastards led to protest from the nobles, and to conflicts between his sons legitimate and illegitimate. When one of the latter, Fernan Sanchez, who had behaved with gross ingratitude and treason to his father, was slain by the legitimate son Pedro, the old king recorded his grim satisfaction. At the close of his life King James divided his states between his sons by Violante of Hungary, Pedro and James, leaving the Spanish possessions on the mainland to the first, the Balearic Islands and the lordship of Montpellier to the second—a division which inevitably produced fratricidal conflicts. The king fell very ill at Alcira, and resigned his crown, intending to retire to the monastery of Poblet, but died at Valencia on the 27th of July 1276.

King James was the author of a chronicle of his own life, written or dictated at different times, which is a very fine example of autobiographical literature. A translation into English by J. Forster, with notes by Don Pascual de Gayangos, was published in London in 1883. See also James I., of Aragon, by F. Darwin Swinfen, (London Press, 1894), in which are many references to authorities.

JAMES II. (c. 1260-1327), king of Aragon, grandson of James I., and son of Peter III. by his marriage with Constance, daughter of Manfred of Beneventum, was left in 1285 as king of Sicily by his father. In 1291, on the death of his elder brother, Alphonso, to whom Aragon had fallen, he resigned his crown, and endeavoured to arrange the quarrel between his own family and the Angevine House, by marriage with Blanca, daughter of Charles of Anjou, king of Naples.

JAMES II. (1243-1311), king of Majorca, inherited the Balearic Islands from his father James I. of Aragon. He was engaged in constant conflict with his brother Pedro III. of Aragon, and in alliance with the French king against his own kin.

JAMES III. (1315-1340), king of Majorca, grandson of James II., was driven out of his little state and finally murdered by his cousin Pedro IV. of Aragon, who definitely reannexed the Balearic Islands to the crown.

JAMES (JAMES FRANCIS EDWARD STUART) (1688-1766), prince of Wales, known to the Jacobites as James III. and to the Hanoverian party as the Old Pretender, the son and heir of James II. of England, was born in St James's Palace, London, on the 10th of June 1688. The scandalous story that he was a supposititious child, started and spread abroad by interested politicians at the time of his birth, has been completely disproved, and most contemporary writers allude to his striking family likeness to the Royal Stuarts. Shortly before the flight of the king to Sheerness, the infant prince together with his mother was sent to France, and afterwards he continued to reside with his father at the court of St Germain. On the death of his father, on the 16th of September 1701, he was immediately proclaimed king by Louis XIV. of France, but a fantastic attempt to perform a similar ceremony in London so roused the anger of the populace that the mock pursuivants barely escaped with their lives. A bill of attainder against him received the royal assent a few days before the death of William III. in 1702, and the Princess Anne, half-sister of the Pretender, succeeded William on the throne. An influential party still, however, continued to adhere to the Jacobite cause; but an expedition from Dunkirk planned in favour of James in the spring of 1708 failed of success, although the French ships under the comte de Fourbin, with James himself on board, reached the Firth of Forth in safety. At the Peace of Utrecht James withdrew from French territory to Bar-le-Duc in Lorraine. A rebellion in the Highlands of Scotland was inaugurated in September 1715 by the raising of the standard on the braes of Mar, and by the solemn proclamation of James Stuart, "the chevalier of St George," in the midst of the assembled clans, but its progress was arrested in November by the indecisive battle of Sheriffmuir and by the surrender at Preston. Unaware of the gloomy nature of his prospects, the chevalier landed in December 1715 at Peterhead, and advanced as far as the Braes of Clackmannan. He was captured under the earl of Mar; but on learning of the approach of the duke of Argyll, he retreated to Montrose, where the Highlanders dispersed to the mountains, and he embarked again for France. A Spanish expedition sent out in his behalf in 1719, under the direction of Alberoni, was scattered by a tempest, only two frigates reaching the appointed rendezvous in the island of Lewis.

In 1718 James had become affianced to the young princess Maria Clementina Sobieski, grand-daughter of the warrior king of Poland, John Sobieski. The intended marriage was forbidden by the emperor, who in consequence kept the princess and her mother in honourable confinement at Innsbruck in Tirol. An attempt to abduct the princess by means of a ruse contrived by a zealous Jacobite gentleman, Charles Wogan, proved successful; Clementina reached Italy in safety, and she and James were ultimately married at Montefiascone on the 1st of September 1719. James and Clementina were now invited to reside in Rome at the special request of Pope Clement XI., who openly acknowledged their titles of British King and Queen, gave them a papal guard of troops, presented them with a villa at Albano and a palace (the Palazzo Muti in the Piazza dei Santi Apostoli) in the city, and also made them an annual allowance of 12,000 crowns out of the papal treasury. At the Palazzo Muti, which remained the chief centre of Jacobite intriguing, were born James's two sons, Charles Edward (the Young Pretender) and Henry Benedict Stuart. James's married life proved turbulent and unhappy, a circumstance that was principally due to the hot temper and jealous nature of Clementina, who soon after Henry's birth in 1725 left her husband and spent over two years in a Roman convent. At length a reconciliation was effected, which Clementina did not long survive, for she died at the early age of 32 in February 1735. Full regal honours were paid to the Stuart queen at her funeral, and the splendid but tasteless monument by Pietro Bracci (1700-1773) in St Peter's was erected to her memory by order of Pope Benedict XIV.

In the 19th century, when the Stuarts had lost their influence on the political scene, James's health and spirits greatly improved when he now began to grow feeble and indifferent, so that the political adherents of the Stuarts were gradually led to fix their hopes upon the two young princes rather than upon their fathers. Travellers to Rome at this period note that James appeared seldom in public, and that much of his time was given up to religious exercises; he was dévot à l'exéc, so Charles de Brosses, an unprejudiced Frenchman, informs us. It was with great reluctance that James allowed his elder son to leave Italy for France in 1744; nevertheless in the following year, he permitted Henry to follow his brother's example, but with the news of Culloden he evidently came to regard his cause as definitely lost. The estrangement from his elder and favourite son, which arose over Henry's adoption of an ecclesiastical career, so embittered his last years that he sank into a moping invalidry and rarely left his chamber. With the crushing failure of the
"Forty-five" and his quarrel with his heir, the once-dreaded James soon became a mere cipher in British politics, and his death at Rome on the 2nd of January 1766 passed almost unnoticed in London. He was buried with regal pomp in St Peter's, where Canova's famous monument, erected by Pius VII. in 1819, commemorates him and his two sons. As to James's personal character, there is abundant evidence to show that he was grave, high-principled, industrious, abstemious and dignified, and that the unflattering portrait drawn of him by Thackeray in Esmond is utterly at variance with historical facts. Although a fervent Roman Catholic, he was far more reasonable and liberal in his religious views than his father, as many extant letters testify.

See Earl Stanhope, History of England and Decline of the Last Stuarts (1853); Calendar of the Stuart Papers at Windsor Castle; J. H. Jessé, Memories of the Pretenders and their Adherents (1845); Sir John Doran, "Mann" and Manners at the Court of Florence (1876); Relazione della morte di Giacomo III., Re d'Inghilterra; and Charles de Brosses, Lettres sur l'Italie (1856). (H. M. V.)

JAMES, DAVID (1839-1893), English actor, was born in London, his real name being Belasco. He began his stage career at an early age, and after 1863 gradually made his way in humorous parts. His creation, in 1875, of the part of Perkyn Middleton in Our Boys made him famous as a comedian, the performance obtaining for the piece a then unprecedented run from the 16th of January 1875 till the 18th of April 1879. In 1883 he had another notable success as Blueskin in Little Jack Sheppard at the Gaiety Theatre, his principal associates being Fred Leslie and Nellie Farren. His song in this burlesque, "Botany Bay," became widely popular. In the part of John Dory in Wild Oats he again made a great hit at the Criterion Theatre in 1886; and among his other most successful impersonations were Simon Ingot in David Garrick, Tweedie in Tweedie's Rights, Macclesfield in The Gw'or', and Eccles in Caste. His uncanny humour and unfailing spirits made him a great favourite with the public. He died on the 2nd of October 1893.

JAMES, GEORGE PAYNE RAINSFORD (1790-1860), English novelist, son of Pinkstan James, physician, was born in George Street, Hanover Square, London, on the 9th of August 1799. He was educated at a private school at Putney, and afterwards in France. He began to write early, and had, according to his own account, composed the stories afterwards published as A Siring of Pearls before he was seventeen. As a contributor to newspapers and magazines, he came under the notice of Washington Irving, who encouraged him to produce his Life of Edward the Black Prince (1822). Richelieu was published in 1825, and was well thought of by Sir Walter Scott (who apparently saw it in manuscript), but was not brought out till 1829. Perhaps Irving and Scott, from their natural amiability, were rather dangerous advisers for a writer so inclined by nature to abundant production as James. But he took up historical romance writing at a lucky moment. Scott had firmly established the popularity of the style, and James in England, like Dumas in France, reaped the reward of their master's labours as well as of their own. For thirty years the author of Richelieu continued to pour out novels of the same kind though of varying merit. His works in prose fiction, verse narrative, and history of an easy kind are said to number over a hundred, most of them being three-volume novels of the usual length. Fifty-seven catalogued are in the British Museum. The best examples of his style are perhaps Richelieu (1829); Philip Augustus (1831); Henry Stuart (1833); probably the best of all (1832); Mary of Burgundy (1834); Darnley (1830); Corse de Leon (1841); The Smuggler (1845). His poetry does not require special mention, nor does his history, though for a short time during the reign of William IV. he held the office of historiographer royal. After writing copiously for about twenty years, James in 1850 went to America as British Consul for Massachusetts. He was consul at Richmond, Virginia, from 1852 to 1856, when he was appointed to a similar post at Venice, where he died on the 4th of June 1860.

James has been compared to Dumas, and the comparison holds good in respect of kind, though by no means in respect of merit. Both had a certain gift of separating from the picturesque parts of history what could without much difficulty be worked up into picturesc fiction, and both were possessed of a ready pen. Here, however, the likeness ends. Of purely literary talent James had little. His plots are poor, his descriptions weak, his dialogue often below even a fair average, and he was deplorably prone to repeat himself. The "two cavaliers" who in one form or another open most of his books have passed into a proverb, and Thackeray's good-natured but fatal parody of Barbare is likely to outlast Richelieu and Darnley by many a year. Nevertheless, though James cannot be allowed any very high rank among novelists, he had a genuine narrative gift, and, though his very best books fall far below Les trois mousquetaires and La reine Margot, there is a certain even level of interest that may be found in all of them. James never resorted to illegitimate methods to attract readers, and deserves such credit as may be due to a purveyor of amusement who never caters for the less creditable tastes of his guests.

His best novels were published in a revised form in 21 volumes (1844-1849).

JAMES, HENRY (1843-1916), American author, was born in New York on the 15th of April 1843. His father was Henry James (1811-1882), a theological writer of great originality, from whom both he and his brother Professor William James derived their psychological subtilty and their idiomatic, picturesque English. Most of Henry's boyhood was spent in Europe, where he studied under tutors in England, France and Switzerland. In 1860 he returned to America, and began reading law at Harvard, only to find speedily that literature, not law, was what he most cared for. His earliest short tale, "The Story of a Year," appeared in 1865, in the Atlantic Monthly, and frequent stories and sketches followed. In 1869 he again went to Europe, where he subsequently made his home, for the most part living in London, or at Rye in Sussex. Among his specially noteworthy works are the following: Watch and Ward (1871); Roderick Hudson (1875); The American (1877); Daisy Miller (1878); French Poets and Novelists (1878); A Life of Hawthorne (1879); The Portrait of a Lady (1881); Portraits of Places (1884); The Bostonians (1886); Partial Portraits (1888); The Tragic Muse (1890); Essays in London (1893); The Two Magics (1898); The Awkward Age (1898); The Wings of the Dove (1903); The Ambassadors (1903); The Golden Bowl (1904); English Hours (1905); The American Scene (1907); The High Bid (1909); Italian Hours (1909).

As a novelist, Henry James is a modern of the moderns both in subject matter and in method. He is entirely loyal to contemporaneous life and reverentially exact in his transcription of the phase. His characters are for the most part people of the world who conceive of life as a fine art and have the leisure to carry out their theories. Rarely are they at close quarters with any ugly practical task. They are subtle and complex with the subtlety and the complexity that come from conscious preoccupation with themselves. They are specialists in conduct and past masters in casuistry, and are full of variations and shadows of turning. Moreover, they are finely expressive of milieu; each belongs unmistakably to his class and his race; each is true to inherited moral traditions and delicately illustrative of some social code. To reveal the power and the tragedy of life through so many minutely limiting and apparently artificial conditions, and by means of characters who are somewhat self-conscious and are apt to make of life only a pleasant pastime, might well seem an impossible task. Yet it is precisely in this that Henry James is pre-eminently successful. The essentially human is what he really cares for, however much he may at times seem preoccupied with the technique of his art or with the mask of conventions through which he makes the essentially human reveal itself. Nor has "the vista of the spiritual been denied him." No more poignant spiritual tragedy has been recounted in recent fiction than the story of Isabel Archer in The Portrait of a Lady. His method, too, is as modern as his subject matter. He early
fall in love with the "point of view," and the good and the bad qualities of his work all follow from this literary passion. He is a very sensitive impressionist, with a technique that can fix the most elusive phase of character and render the most baffling surface. The skill is unending with which he places his characters in such relations and under such lights that they flash out in due succession their continuously varying facets. At times he may seem to forget that a character is something incalculably more than the sum of all its phases; and then his characters tend to have their existence, as Positivists expect to have their immortality, simply and solely in the minds of other people. But when his method is at its best, the delicate phases of character that he transcribes coalesce perfectly into clearly defined and suggestive images of living, acting men and women. Doubtless, there is a certain initiation necessary for the enjoyment of Mr James. He presupposes a cosmopolitan outlook, a certain interest in art and in social artifice, and no little abstract curiosity about the workings of the human mechanism. But for speculative readers, for readers who care for art in life as well as for life in art, and for readers above all who want to encounter and comprehend a great variety of very modern and finely modulated characters, Mr James holds a place of his own, unrivalled as an interpreter of the world of to-day.

For a list of the short stories of Mr Henry James, collected them together into one volume or other by the bibliographer F. A. King, in The Novels of Henry James, by Elisabeth L. Cary (New York and London, 1905), and by Le Roy Phillips, A Bibliography of the Writings of Henry James (Boston, Mass., 1906). In 1909 an edition de luxe of Henry James's novels was published in 24 volumes.

JAMES, JOHN ANGELL (1785-1859), English Nonconformist divine, was born at Blandford, Dorsetshire, on the 6th of June 1785. At the close of his seven years' apprenticeship to a linen-draper at Poole he decided to become a preacher, and in 1802 he went to David Bogue's training institution at Gosport. A year and a half later, on a visit to Birmingham, his preaching was so highly esteemed by the congregation of Carr's Lane Independent chapel that they invited him to exercise his ministry amongst them; he settled there in 1803, and was ordained in May 1806. For several years his success as a preacher was comparatively small; but he jumped into popularity about 1814, and began to attract large crowds wherever he officiated. At the same time his religious writings, the best known of which are The Anxious Inquirer and An Earnest Ministry, acquired a wide circulation. James was a typical Congregational preacher of the early 19th century, massive and elaborate rather than original. His preaching displayed little or nothing of Calvinism, the earlier severity of which had been modified in Birmingham by Edward Williams, one of his predecessors. He was one of the founders of the Evangelical Alliance and of the Congregational Union of England and Wales. Municipal interests appealed strongly to him, and he was also for many years chairman of Spring Hill (afterwards Mansfield) College. He died at Birmingham on the 1st of October 1859.

JAMES, THOMAS (c. 1572-1620), English librarian, was born at Newport, Isle of Wight. He was educated at Winchester and New College, Oxford, and became a fellow of New College in 1593. His wide knowledge of books, together with his skill in deciphering manuscripts and detecting literary forgeries, secured him in 1602 the post of librarian to the library founded in that year by Sir Thomas Bodley at Oxford. At the same time he was made rector of St Aldate's, Oxford. In 1603 he compiled a classified catalogue of the books in the Bodleian Library, but in 1620 substituted for it an alphabetical catalogue. The arrangement in 1610, whereby the Stationers' Company undertook to supply the Bodleian Library with every book published, was James's suggestion. Ill health compelled him to resign his post in 1620, and he died at Oxford in August 1620.

JAMES, WILLIAM (d. 1827), English naval historian, author of the Naval History of Great Britain from the Declaration of War by France in 1793 to the Accession of George IV., practised as a proctor in the admiralty court of Jamaica between 1801 and 1813. He was in the United States when the war of 1812 broke out, and was detained as a prisoner, but escaped to Halifax. His literary career began by letters to the Naval Chronicle over the signature of "Boxer." In 1816 he published An Inquiry into the Merits of the Principal Naval Actions between Great Britain and the United States. In this pamphlet, which James republished in 1817, enlarged and with a new title, his object was to prove that the American frigates were stronger than their British opponents nominally of the same class. In 1819 he began his Naval History, which appeared in five volumes (1822-1824), and was reprinted in six volumes (1826). It is a monument of pains-taking accuracy in all such matters as dates, names, tonnage, armament and movements of ships, though no attempt is ever made to show the connexion between the various movements. James died on the 8th of May 1827 in London, leaving a widow who received a civil list pension of £100.

A collection of James's works, with additions and notes by Capt. F. Chamier, was published in 1837, and a further one in 1886. An edition epitomized by R. O'Byrne appeared in 1888, and an Index by C. G. Toogood was issued by the Navy Records Society in 1891.

JAMES, WILLIAM (1842-1910), American philosopher, son of the Swedenborgian theologian Henry James, and brother of the novelist Henry, was born on the 11th of January 1842 at New York City. He graduated M.D. at Harvard in 1870. Two years after he was appointed a lecturer at Harvard in anatomy and physiology, and later in psychology and philosophy. Subsequently he became assistant professor of philosophy (1886-1888), professor (1888-1889), professor of psychology (1889-1897) and professor of philosophy (1897-1907). In 1890-1901 he delivered the Gifford lectures on natural religion at the university of Edinburgh, and in 1908 the Hibbert lectures at Manchester College, Oxford. With the appearance of his Principles of Psychology (2 vols., 1890), James at once stepped into the front rank of psychologists as a leader of the physical school, a position which he maintained not only by the brilliance of his analogies but also by the freshness and unconventionality of his style. In metaphysics he upheld the idealist position from the empirical standpoint. Beside the Principles of Psychology, which appeared in a shorter form in 1892 (Psychology), his chief works are: The Will to Believe (1897); Human Immortality (Boston, 1889); Talks to Teachers (1890); The Varieties of Religious Experience (New York, 1902); Pragmatism—a New Name for Some Old Ways of Thinking (1907); A Pluralistic Universe (1909); Hibbert lectures, in which, though he still attacked the hypothesis of absolutism, he admitted it as a legitimate alternative. He received honorary degrees from Padua (1893), Princeton (1896), Edinburg (1902), Harvard (1905). He died on the 27th of August 1910.

JAMES OF HEREFORD, HENRY JAMES, 1ST BARON (1828-1895), English lawyer and statesman, son of P. T. James, surgeon, was born at Hereford on the 30th of October 1828, and educated at Cheltenham College. A prize-man of the Inner Temple, he was called to the bar in 1852 and joined the Oxford Circuit, where he made a name, "in the same rank with Sir Edward Dillon," as he was "at the present time the most esteemed member of the court of exchequer," and in 1866 became a Q.C. At the general election of 1868 he obtained a seat in parliament for Taunton as a Liberal, by the unseating of Mr Serjeant Cox on a scrutiny in March 1866, and he kept the seat till 1885, when he was returned for Bury. He attracted attention in parliament by his speeches in 1872 in the debates on the Judicature Act. In 1875 (September) he was made solicitor-general, and in November attorney-general, and knighted; and when Gladstone returned to power in 1880 he resumed his office. He was responsible for carrying the Corrupt Practices Act of 1883. On Gladstone's conversion to Home Rule, Sir Henry James parted from him and became one of the most influential of the Liberal Unionists: Gladstone had offered him the lord chancellorship in 1886, but he declined it; and the knowledge
of the sacrifice he had made in refusing to follow his own chief in his new departure lent great weight to his advocacy of the Unionist cause in the country. He was one of the leading counsellors for The Times before the Parnell Commission, and from 1892 to 1895 was attorney-general to the Prince of Wales.

From 1895 to 1902 he was a member of the Unionist ministry as chancellor for the Duchy of Lancaster, and in 1895 he was made a peer as Baron James of Hereford. In later years he was a prominent opponent of the Tariff Reform movement, adhering to the section of Free Trade Unionists.

JAMES, EPISTLE OF, a book of the New Testament. The superscription (Jas. i. 1) ascribes it to that pre-eminent “pillar” (Gal. ii. 9) of the original mother church who later came to be regarded in certain quarters as the “bishop of bishops” (Epist. of James to Clement, Cl. Clemen. Hom. Superscription). As such he appears in a position to address an encyclical to “the twelve tribes of the dispersion”; for the context (i. 18, v. 7 seq.) and literary relation (cf. 1 Pet. i. 3, 23-25) prove this to be a figure for the entire new people of God, without the distinction of carnal birth, as Paul had described “the Israel of God” (Gal. vi. 16), spiritually begotten, like Isaac, by the word received in faith (Gal. iii. 28 seq., iv. 26; Rom. ix. 6-9, iv. 16-18). This idea of the spiritually begotten Israel becomes current after 1 Pet., as appears in 1 John i. 11-13, iii. 3-8; Barn. iv. 6, xiii. 13; 2 Clem. ii. 2, &c.

The interpretation which takes the expression “the twelve tribes” literally, and conceives the brother of the Lord as sending an epistle written in the Greek language throughout the Christian world, but as addressing Jewish Christians only (so e.g. Sieffert, s.v. “Jacobus in N.T.”), in Hauck, Realencycl. ed. 1900, vol. viii.), assumes not only such divisive interference as Paul might justly resent (cf. Gal. ii. 10-11), but involves a strange idea of conditions. Were worldliness, tongue, religion, moral indifference, the distinctive marks of the Jewish element? Surely the rebukes of James apply to conditions of the whole Church and not sporadic Jewish-Christian conventicles in the Greek-speaking world, if any such existed.

It is at least an open question whether the superscription (connected with that of Jude) be not a later conjecture preferred by some compiler of the catholic epistles, but of the late date implied in our interpretation of ver. 1 there should be small dispute. Whatever the currency in classical circles of the epistle as a letter to James, it is irrational to put first in the development of Christian literature this distinctive distinguishing the writing, the name, the tone, the thought of James, Greek, and afterwards the Pauline letters, which both as to origin and subsequent circulation were a product of conditions. The order consonant with history is (1) Paul’s “letters” to “the churches” of a province (Gal. i. 2; 2 Cor. i. 1); (2) the address to “the elect of the dispersion” in a group of the Pauline provinces (1 Pet. i. 1); (3) the address to “the twelve tribes of the dispersion” everywhere (Jas. i. 1; cf. Rev. vii. 2-4). James, like 1 John, is a homily, even more lacking than 1 John in every epistolary feature, not even supplied with the customary epistolary farewell. The superscription, if original, compels us to treat the whole writing as not only late but pseudonymous. If prefixed by conjecture, to secure recognition and authority for the book, even this was at first a failure. The earliest trace of any recognition of it is in Origen (A.D. 230) who refers to it as “said to be from James” (δεδομένη ἦν Ἰακώβου Ἐπιστολή), seeming thus to regard ver. 1 as superscription rather than part of the text. Eusebius (A.D. 325) classifies it among the disputed books, declaring that it is regarded as spurious, and that not many of the ancients have mentioned it. Even Jerome (A.D. 320), though he accepted it, admitted that it was “said to have been published by another in the name of James.” The Syrian canon of the Peshitta was the first to admit it.

Modern criticism naturally made the superscription its starting-point, endeavouring first to explain the contents of the writing on this theory of authorship, but generally reaching the conclusion that the two do not agree. Conservatives as a rule avoid the implication of a direct polemic against Paul in ii. 14-26, which would lay open the author to the bitter accusations launched against the interlopers of 2 Cor. xxiii., by dating before the Judaistic controversy. Other

1 Nothing added by Lightfoot (Comm. on Gal. Exc. “The faith of Abraham”) justifies the unsupported and improbable assertion that the quotation James ii. 21 seq. was probably in common use among the Jews to prove that the orthodoxy of Paul was insufficient for salvation” (Mayor, s.v. “James, Epistle of” in Hastings’ Dict. Bible, p. 546).
James, Epistle of

the relation has been defined above. Dependence on Revelation (A.D. 95) is probable (cf. i. 12 and ii. 5 with Rev. ii. 9, 10 and v. 9 with Rev. iii. 20), but the contacts with Clement of Rome (A.D. 95-120) indicate the reverse relation. James iv. 6 and v. 20 = 1 Clem. xlix. 5 and xxii. 2; but as both passages are also found in 1 Pet. iv. 8, v. 5, the latter may be the common source. Clement's further development of the cases of Abraham and Rahab, however, adding as it does to the demonstration of James from Scripture of their justification by works and not by faith only, that the particular good work which "wrought with the faith," of Abraham and Rahab to their justification was "hospitality" (1 Clem. x-xii.) seems plainly to presuppose James. Priority is more difficult to establish in the case of Hermas (A.D. 120-160), where the contacts are undisputed (cf. James iv. 7, 12 with Mand. xii. 5; 6; Sim. ix. 23).4

The date (A.D. 95-120) implied by the literary contacts of James of course precludes authorship by the Lord's brother, though this does not necessarily prove the superscription later still. The question whether the writing as a whole is pseudonymous, or only the superscription a mistaken conjecture by the scribe of Jude 1 is of secondary importance. A date about 100-130 for the substance of the writing is accepted by the majority of modern scholars and the prevalent idea in pointing out the similarities of James and the Shepherd of Hermas declares it to be certain that both writings presuppose like historical circumstances, and, from a similar point of view, direct their admonitions to their contemporaries, among whom a lax worldly-mindedness and unfruitful theological wrangling threatened to destroy the religious life.5 Holtzmann has characterized this as "the right visual angle" for the judgment of the book. Questions to the obligation of Mosaicism and the relations of Jew and Gentile have utterly disappeared below the horizon. Neither the attachment to the religious forms of Judaism, which we are informed was characteristic of James, nor that personal relation to the Lord which gave him his supreme distinction are indicated by so much as a single word. Instead of being written in Aramaic, as it would almost necessarily be if antecedent to the Pauline epistles, or even in the Semitic style characteristic of the older and more Palestinian elements of the New Testament, we have a Greek even more fluent than Paul's and metaphors and allusions (i. 17, iii. 1-12) of a type more like Greek rhetoric than anything else in the New Testament. Were we to judge by the contact with Hebrews, Clement of Rome and Hermas and the similarity of situation evidenced in the last-named, Rome would seem the most natural place of origin. The history of the epistle's reception into the canon is not opposed to this; for, once it was attributed to James, Syria would be more likely to take it up, while the West, more sceptical, if not better informed as to its origin, held back; just as happened in the case of Hebrews.

It is the author's conception of the nature of the gospel which mainly gives us pause in following this pretty general disposition of modern scholarship. With all the phenomena of vocabulary and style which seem to justify such conceptions as von Soden's that c. iii. and iv. 11-19 represent excerpts respectively from the essay of an Alexandrian scribe, and a fragment of Jewish apocalyptic, the analysis above given will be found the exponent of a real logical sequence. We might almost admit a resemblance in form to the general literary type which Spitta adduces. The term "wisdom" is included in the special and technical sense of the "wisdom" of Hebrew literature (Matt. xxii. 34), the sense of "the wisdom of the just" of Luke i. 17. True, the mystical sense given to the term in one of the sources of Luke, by Paul and some of the Church fathers, is not present. While the gospel is pre-eminent the divine gift of "wisdom," "wisdom" is not personified, but conceived primarily as a system of humanitarian ethics, i. 21-25, and only secondarily as a spiritual effluence, imparting the regenerate disposition, the "mind that was in Christ Jesus," iii. 13-18. And yet for James as well as for Paul Christ is "the wisdom of God." The difference in conception of the term is similar to that between Ecclesiastes and the Wisdom of Solomon. Our author, like Paul, expects the hearers of the word to be "a kind of first-fruits to God of his creation." (i. 18 cf. 1 Pet. i. 23), and bids them depend upon the gift of grace (i. 5, iv. 5 seq.), but for the evils of the world he has no remedy but the patient endurance of the Christian philosopher (i. 2-18). For the faithlessness (ἀθετεῖαι i. 6-8; cf. Didache and Hermas), worldliness (ii. 1-13) and hollow profession (ii. 14-20) of the church life of his time, with its "theological wrangling" (iii. 1-12), his remedy is again the God-given, peaceable spirit of the Christian philosopher (iii. 13-18), which is the antithesis of the spirit of self-seeking and censoriousness (iv. 1-12), and which appreciates the pettiness of earthly life with its sordid gains and its unjust distribution of wealth (iv. 13-19). This attitude of the Christian stoic will maintain the individual in his patient waiting for the expected "coming of the Lord" (v. 7-11); while the church sustains its official functions of healing and prayer, and reclamation of the erring (v. 13-20). For this conception of the gospel and of the officially organized church, our nearest analogy is in Matthew, or rather in the blocks of precepts of the Lord which after all constitute the "apocatastasis" of the authors who desired to underlie our first gospel. It may be mere coincidence that the material in Matthew as well as in the Didache seems to be arranged in five divisions, beginning with a commendation of the right way, and ending with warnings of the judgment, while the logical analysis of James yields something similar; but of the affinity of spirit there can be no doubt.

The type of ethical thought exemplified in James has been called Ebionite (Hilgenfeld). It is clearly manifest in the humanitarianism of Luke also. But with the possible exception of the prohibition of oaths there is nothing which ought to suggest the epiph. The strong sense of social wrongs, the impatience with tongue-religion, the utter ignoring of ceremonious, the reflection on the value and significance of "life," are distinctive simply of the "wisdom" writers. Like these our author holds himself so far aloof from current debate of ceremonial or doctrine as to escape our principal standards of measurement regarding place and time. Certain general considerations, however, are fairly decisive. The prolonged effort, mainly of English scholarship, to make the conception of the author of the epistle of James to be the basis of the Pauline epistles, grows more increasingly hopeless with increasing knowledge of conditions, linguistic and other, in that early period. The moralistic conception of the gospel as a "law of liberty," the very phrase recalling the expression of Barn. ii., "the new law of Christ, which is without the yoke of constraint," the conception of the church as primarily an ethical society, its functions actually officially distributed, suggest the period of the Didache, Barnabas and Clement of Rome. Independently of the literary contacts we should judge the period to be about A.D. 100-120. The connexions with the Pauline epistles are conclusive for a date later than the death of James; those with Clement and Hermas are perhaps sufficient to date it as prior to the former, and suggest Rome as the place of origin. The connexions with wisdom-literature favour somewhat the Hellenistic culture of Syria, as represented for example at Antioch.

The most important commentaries on the epistle are those of M. Hengstenberg (1823), K. G. W. Theile (1833), J. Kern (1838), G. H. Ewald (1892), C. F. G. Harnacker (1888), H. S. (1898), J. B. Mayor (1892) and W. Patrick (1906). The pre-Pauline date is championed by W. Weiss (Introdit.), W. Byleschlag (Meyer's Commentary), Th. Zahn (Introdit.), J. B. Mayor and W. Patrick. J. V. Bachhuber (1869), and F. von Emden (1893) is still common among English interpreters. F. K. Zimmer (Zw. Th. 1893) showed the priority of Paul, with many others. A. Hilgenfeld (Ebd.)

2 Das Urchristenthum, 1868, quoted by Cone, loc. cit.
3 The logical relation of v. 12 to the context is problematical. Perhaps it may be accounted for by the order of the compend of Christian ethics the writer was following. Cf. Matt. v. 34-37 in relation to Matt. v. 12 (cf. ver. 10) and vi. 19 seq. (cf. ver. 2, and iv. 13 seq.). The non-charismatic conception of healing, no longer the "gift" of some layman in the community (1 Cor. xii. 9 seq.) but a function of the "elders" (1 Tim. iv. 14), is another indication of comparatively late date.
damm) and A. Harnack (Chron.) under Hadrian. A convenient 
synopsis of results will be found in J. Moffat, Historical New Test.; 
(pp. 576-581), and in the articles s. e. "James" in Encyc. Bibl. and 
the Bible Dictionaries.

JAMESON, ANNA BROWNEll (1794-1860), British writer, 
was born in Dublin on the 17th of May 1794. Her father, Denis 
Brownell Murphy (d. 1842), a miniature and enamel painter, 
remained in England to 1798 with his family, and eventually 
settled at Hanwell, near London. At sixteen years of age Anna 
became governess in the family of the marquis of Winchester. 
In 1821 she was engaged to Robert Jameson. The engagement 
was broken off, and Anna Murphy accompanied a young pupil 
to Italy, writing in a fictitious character a narrative of what 
she saw and did. This diary she gave to a bookseller on condition 
of receiving a guitar if he secured any profits. Colburn ulti-
ately published it as The Diary of an Emmys (1826), which 
attracted much attention. The author was engaged to the 
children of Mr Littleton, afterwards Lord Hatherton, from 1821 
to 1825, when she married Robert Jameson. The marriage 
proved unhappy; when, in 1829, Jameson was appointed puisne 
judge in the island of Dominica the couple separated without 
regret, and Mrs Jameson visited the continent again with her 
father.

The first work which displayed her powers of original thought 
was her Characteristics of Women (1832). These analyses of 
Shakespeare's heroines are remarkable for delicacy of critical 
insight and fineness of literary touch. They are the result of a 
penetrating but essentially feminine mind, applied to the study 
of individuals of its own sex, detecting characteristics and 
defining differences not perceived by the ordinary critic and en-
tirely overlooked by the general reader. German literature and 
art had aroused much interest in England, and Mrs Jameson 
paid her first visit to Germany in 1833. The conglomeration of 
hard lines, cold colours and pedantic subjects which decorated 
Munich under the patronage of King Louis of Bavaria, were new 
to the world, and Mrs Jameson's enthusiasm first gave them an 
English reputation.

In 1836 Mrs Jameson was summoned to Canada by her husband, 
who had been appointed chancellor of the province of Toronto. 
He failed to meet her at New York, and she was left to make her 
way alone at the worst season of the year to Toronto. After 
six months' experiment she felt it useless to prolong a life far 
from all ties of family happiness and opportunities of usefulness. 
Before leaving, she undertook a journey to the depths of the 
Indian settlements in Canada; she explored Lake Huron, and 
saw much of emigrant and Indian life unknown to travellers, 
which she afterwards embodied in her Winter Studies and Summer 
Rambles. She returned to England in 1838. At this period 
Mrs Jameson began making careful notes of the chief private art 
collections in and near London. The result appeared in her 
Companion to the Private Galleries (1842), followed in the same 
year by the Handbook to the Public Galleries. She edited the 
Lady Byron's Early Italian Painters in 1845. In the same year 
she visited her friend Ottile von Goethe. Her friendship with 
Lady Byron dates from about this time and lasted for some 
seven years; it was brought to an end apparently through Lady 
Byron's unreasonable temper. A volume of essays published in 
1846 contains one of Mrs Jameson's best pieces of work, The 
House of Titian. In 1847 she went to Italy with her niece and 
subsequent biographer (Memoirs, 1878), Geraldine Bate (Mrs 
Macpherson), to collect materials for the work on which her 
reputation rests — her series of Sacred and Legendary Art. 
The time was ripe for such contributions to the traveler's library. 
The Acta Sanctorum and the Book of the Golden Legend had had 
their readers, but no one had ever pointed out the connexion 
between these tales and the works of Christian art. The way 
to these studies had been pointed out in the preface to Kugler's 
Handbook of Italian Painting by Sir Charles Eastlake, who had 
intended pursuing the subject himself. Eventually he made 
over to Mrs Jameson the materials and references he had 
collected. She recognized the extent of the ground before her as 
a mingled sphere of poetry, history, devotion and art. She 
infected her readers with her own enthusiastic admiration; 
and, in spite of her slight technical and historical equipment, 
Mrs. Jameson produced a book which thoroughly deserved its 
great success.

She also took a keen interest in questions affecting the educa-
tion, occupations and maintenance of her own sex. Her early 
essay on The Relative Social Position of Mothers and Governesses 
was the work of one who knew both sides; and in no respect does 
she more clearly prove the falseness of the position she describes 
in that the certainty with which she predicts its eventual reform. 
To her we owe the first popular enunciation of the principle of 
the male and female co-operation in works of mercy and education. 
In her later years she took up a succession of subjects all bearing 
the same principles of active benevolence and the best ways 
of carrying them into practice. Sisters of charity, hospitals, 
penitentiaries, prisons and workhouses all claimed her interest 
— all more or less included under those definitions of "the 
commission of love and communion of labour" which are inter-
connected with her memory. To the clear and temperate forms 
in which she brought the results of her convictions before her 
friends in the shape of private lectures — published as Sisters 
of Charity (1855) and The Communion of Labour (1856)— may be 
traced the source whence later reformers and philanthropists 
took counsel and courage.

Mrs Jameson died on the 17th of March 1860. She left the 
last of her Sacred and Legendary Art series in preparation. 
It was completed, under the title of The History of Our Lord in Art, 
by Lady Eastlake.

JAMESON (of Jamesone), GEORGE (c. 1587-1644), Scottish 
portrait-painter, was born at Aberdeen, where his father was 
architect and a member of the guild. After studying painting 
under Rubens at Antwerp, with Vandyck as a pupil, he 
returned in 1620 to Aberdeen, where he was married in 1624 and 
remained at least until 1630, after which he took up his residence 
in Edinburgh. He was employed by the magistrates of Edin-
burgh to copy several portraits of the Scottish kings for presen-
tation to Charles I. On his first visit to Scotland in 1623, and 
the king rewarded him with a diamond ring from his own finger. 
This circumstance at once established Jameson's fame, and he 
soon found constant employment in painting the portraits of 
the Scottish nobility and gentry. He also painted a portrait of 
Charles, which he declined to sell to the magistrates of 
Aberdeen for the price they offered. He died at Edinburgh in 
1644.

JAMESON, LEANDER STARR (1853- ), British colonial 
statesman, son of R. W. Jameson, a writer to the signet in Edin-
burgh, was born at Edinburgh in 1835, and was educated for the 
medical profession at University College Hospital, London 
(M.R.C.S. 1857; M.D. 1877). After acting as house physician, 
house surgeon and demonstrator of anatomy, and showing 
promise of a successful professional career in London, his health 
broke down from overwork in 1878, and he went out to South 
Africa where, in 1889, he was appointed governor of Cape Town. 
He rapidly acquired a great reputation as a medical man, and, 
besides numbering President Kruger and the Matabele chief 
Lobengula among his patients, came much into contact with Cecil 
Rhodes. In 1888 his influence with Lobengula was successfully 
exerted to induce that chieftain to grant the concessions to the 
agents of Rhodes which led to the formation of the British South 
Africa Company; and when the company proceeded to open up 
Mashonaland, Jameson abandoned his medical practice and joined 
the pioneer expedition of 1890. From this time his fortunes 
were bound up with Rhodes's schemes in the north. Imme-
diately after the pioneer column had occupied Mashonaland, 
Jameson, with F. C. Selous and A. R. Colquhoun, went east to 
Manicaland and was instrumental in securing the greater part 
of that country, to which Portugal was laying claim, for the 
Chartered Company. In 1891 Jameson succeeded Colquhoun as 
administrator of Rhodesia. The events connected with his
JAMESON, R.—JAMESTOWN

vigorouse administration and the wars with the Matabele are narrated under RHODESIA. At the end of 1861, "Dr Jim" (as he was familiarly called) came to England and was seated on all sides; he was made a C.B., and returned to Africa in the spring of 1865 with enhanced prestige. On the last day of that year the world was startled to learn that Jameson, with a force of 600 men, had made a raid into the Transvaal in support of a projected rising in Johannesburg, which had been connived at by Rhodes at the Cape (see RHODES AND TRANS-VAAL). Jameson's force was compelled to surrender at Doornkop, receiving a guarantee that the lives of all would be spared; he and his officers were sent to Pretoria, and, after a short delay, during which time sections of the Boer populace clamoured for the execution of Jameson, President Kruger on the surrender of Johannesburg (January 7) handed them over to the British government for punishment. They were tried in London under the Foreign Enlistment Act in May 1895, and Dr Jameson was sentenced to fifteen months' imprisonment at Holloway. He served a year in prison, and was then released on account of ill-health. He still retained the affections of the white population of Rhodesia, and subsequently returned there in an unofficial capacity. He was the constant companion of Rhodes in his journeys through South Africa, on which Rhodes died in May 1902 Jameson was left one of the executors of his will. In 1903 Jameson came forward as the leader of the Progressive (British) party in Cape Colony; and that party being victorious at the general election in January-February 1904, Jameson formed an administration in which he took the post of prime minister. He had to face a serious economic crisis and strenuously promoted the development of the agricultural and pastoral resources of the colony. He also passed a much needed Redistribution Act, and in the session of 1906 passed an Amnesty Act restoring the rebel voters to the franchise. Jameson, as prime minister of Cape Colony, attended the Colonial conference held in London in 1907. In September of that year the Cape parliament was dissolved, and as the elections for the legislative council went in favour of the Bond, Jameson resigned office, 31st of January 1908 (see Cape Colony: History). In 1908 he was chosen one of the delegates from Cape Colony to the inter-colonial convention for the closer union of the South African states, and he took a prominent part in settling the terms on which that union was effected in 1909. It was at Jameson's suggestion that the Orange River Colony was renamed Orange Free State Province.

JAMESON, ROBERT (1774-1854), Scottish naturalist and mineralogist, was born at Leith on the 11th of July 1774. He became assistant to a surgeon in his native town; but, having studied natural history under Dr John Walker in 1792 and 1793, he felt that his true province lay in that science. He went in 1800 to Freiberg to study for nearly two years under Werner, and spent two more in continental travel. In 1804 he succeeded Dr Walker as regius professor of natural history in Edinburgh university, and became perhaps the first eminent exponent in Great Britain of the Wernerian geological system; but when he found that theory untenable, he frankly announced his conversion to the views of Hutton. As a teacher, Jameson was remarkable for his power of imparting enthusiasm to his students, and from his class-room there radiated an influence which gave a marked impetus to the study of geology in Britain. His energy also, by means of government aid, private donation and personal outlay, brought about a great part of the splendid collection of minerals which now occupies the Geological Museum of the Royal Scottish Museum in Edinburgh. In 1819 Jameson, with Sir David Brewster, started the Edinburgh Philosophical Journal, which after the tenth volume remained under his sole conduct till his death, which took place in Edinburgh on the 19th of April 1854. His bust now stands in the hall of the Edinburgh University library.

Jameson was the author of Outline of the Mineralogy of the Shetland Islands and of the Island of Arran (1798), incorporated with Mineralogy of the Scottish Isles (1800); Mineralogical Description of Scotland, vol. i., pt. 1. (Dumfries, 1805); this was to have been the first of a series embracing all Scotland; System of Mineralogy (3 vols., 1804-1808; 3rd ed., 1820); Elements of Geography (1809); Mineralogical Travels through the Hebrides, Orkney and Shetland Islands (2 vols., 1813); and Manual of Mineralogy (1821); besides a number of occasional papers, of which a list will be found in the Edinburgh New Philosophical Journal for July 1854, along with a portrait and biographical sketch of the author.

JAMESTOWN, a city and the county-seat of Stuarts county, North Dakota, U.S.A., on the James River, about 93 m. W. of Fargo. Pop. (1900), 2835, of whom 587 were foreign-born; (1905) 5935; (1910) 4328. Jamestown is served by the Northern Pacific railway, of which it is a division head-quarters. At Jamestown is St John's Academy, a school for girls, conducted by the Sisters of St Joseph. The state hospital for the insane is just beyond the city limits. The city is the commercial centre of a prosperous farming and stock-raising region in the James River valley, and has grain-elevators and flour-mills. Jamestown was first settled in 1873, near Fort Seward, a U.S. military post established in 1872 and abandoned in 1877, and was chartered as a city in 1883.

JAMESTOWN, a city of Chautauqua county, New York, U.S.A., at the S. outlet of Chautauqua Lake, 68 m. S. by W. of Buffalo. Pop. (1900), 22,852, of whom 7270 were foreign-born, mostly Swedish; (1910 census) 31,977. It is served by the Erie and the Jamestown, Chautauqua & Lake Erie railways, by electric lines extending along Lake Chautauqua to Lake Erie on the N. and to Warren, Pennsylvania, on the S.; and by steamers on Lake Chautauqua. Jamestown is situated among the hills of Chautauqua county, and is a popular summer resort. There is a free public library. A supply of natural gas (from Pennsylvania) and a fine water-power combine to render Jamestown a manufacturing centre of considerable importance. In 1905 the value of its factory products was $10,340,752, an increase of 33.8% since 1900. The city owns and operates its electric-lighting plant and its water-supply system, the water, of exceptional purity, being obtained from artesian wells 4 m. distant. Jamestown was settled in 1810, was incorporated in 1827, and was chartered as a city in 1886. The city was named in honour of James Prendergast, an early settler.

JAMESTOWN, a former village in what is now James City county, Virginia, U.S.A., on Jamestown Island, in the James River, about 40 m. above Norfolk. It was here that the first permanent English settlement in America was founded on the 13th of May 1607, that representative government was inaugurated on the American Continent in 1619, and that negro servitude was introduced into the original thirteen colonies, also in 1619. In Jamestown was erected the first brick church built in America. The settlement was in a low marshy district which proved to be unhealthy; it was accidentally burned in January 1608, and was almost completely destroyed by Nathaniel Bacon in September 1676, the state house and other buildings were again burned in 1698, and after the removal of the seat of government of Virginia from Jamestown to the Middle Plantations (now Williamsburg) in 1699 the village fell rapidly into decay. Its population had never been large: it was about 490 in 1609, and 163 in 1623; the mortality was always very heavy. By the middle of the 19th century the peninsula on which Jamestown had been situated had become an island, and by 1900 the James River had worn away the shore but had hardly touched the territory of the "New Towne" (1610), immediately E. of the first settlement; almost the only visible remains, however, were the tower of the brick church and a few gravestones. In 1900 the association for the preservation of Virginia antiquities, to which the site was deeded in 1893, induced the United States government to build a wall to prevent the further encroachment of the river. The foundations of several of the old buildings have since been uncovered, many interesting relics have been found, and in 1907 there were erected a brick church (which is as far as possible a reproduction of the fourth one built in 1639-1647), a marble shaft marking the site of the first settlement, another shaft commemorating the first house of burgesses, a bronze monument to the memory of Captain John Smith, and another monument to the memory of Pocahontas. At the head of,
JAMÉSTOWN, the principal importance of details of Sewell's River whence he (as a student of Philologic, ot study, he works its Languages, Jami's works are illustrated in the title-page: Biographical Notices of its Bibliothèca Universitatis Edinburgensis, 1820) and the Sarajevo, the Philosopher of the Persian mystics, who is licensed to be a Dominican friar. He is called to his religious order and is a member of the Order of Preachers. He was an associate of Henry Webber and Scott in Illustrations of Northern Antiquities (1814). He died on the 24th of September 1834.

JAMKHANDI, a native state of India, in the Deccan division of Bombay, ranking as one of the southern Maharatta Jagirs. Area, 524 sq. m. Pop. (1901), 105,537; estimated revenue, £27,000; tribute, £350. The chief is a Brahman of the Patwardhan family. Cotton, wheat and millet are produced, and cotton and silk cloth are manufactured, though not exported. The town of Jamkhandi, the capital, is situated 68 m. E. of Kolhapur. Pop. (1901), 13,029.

JAMMU, or Jummo, the capital of the state of Jammu and Kashmir in Northern India, on the river Tawi (Ta-wi), a tributary of the Chenab. Pop. (1901), 36,130. The town and palace stand upon the right bank of the river; the fort overhangs the left bank at an elevation of 150 ft. above the stream. The lofty whitened walls of the palace and citadel present a striking appearance from the surrounding country. Extensive pleasure grounds, lakes, and gardens of great size, attest the former prosperity of the city when it was the seat of a Rajput dynasty whose dominions extended into the plains and included the modern district of Sialkot. It was afterwards conquered by the Sikhs, and formed part of Ranjit Singh's dominions. After his death it was acquired by Gulab Singh as the nucleus of his dominions, to which the British added Kashmir in 1846. It is connected with Sialkot in the Punjab by a railway 16 m. long. In 1850 the town was devastated by a fire, which destroyed most of the public offices.

The state of Jammu proper, as opposed to Kashmir, consists of a submontane tract, forming the upper basin of the Chenab. Pop. (1901), 1,521,307, showing an increase of 5% in the decade. A land settlement has recently been introduced under British supervision.

JAMSHID (T 'aqwia or Tāqwā), the Greek form of the Hebrew name Jaisingh—i.e. "God caused to build." (Josh. xxv. 11.)—or Jubbah (2 Chron. xxvi. 6), the modern Arabic name, a town of Palestine, on the border between Dan and Judah, situated 13 m. S. of Jaffa, and 4 m. E. of the seashore. The modern village stands on an isolated sandy hillock, surrounded by gardens with olives to the north and sand-dunes to the west. It contains a small crusaders' church, now a mosque. Jamnian belonged to the Philistines, and Uzziah of Judah is said to have taken it (2 Chron. xxvi. 6). In Maccabean times Joseph and Azarias attacked it unsuccessfully (1 Macc. v. 55-62; 2 Macc. xii. 8 seq. is untrustworthy). Alexander the Great subdue it, and under Pompey it became Roman. It changed hands several times, is mentioned by Strabo (xvi. 2) as being once very populous, and in the Jewish war was taken by Vespasian. The population was mainly Jewish (Philo, Leg. ad Gaium, § 80), and the town is principally famous as having been the seat of the Sanhedrin and the religious centre of Judaism from a.d. 70 to 135. It sent a bishop to Nicaea in 325. In 1144 a crusaders' castle was built on the hill, which is often mentioned under the name Ibelin. There was also a Daulnul in Lower Galilee (Josh. xix. 33), called later Caphar Yama, the present village Yamma, 8 m. S. of Tiberias; and another fortress in Upper Galilee was named Jamnia (Josephus, Vita, 37). Attempts have been made to unify these two Galilean sites, but without success.

JAMURD, a fort and cantonment in India, just beyond the border of Peshawar district, North-West Frontier Province, situated at the mouth of the Khyber Pass, 10½ m. W. of Peshawar city, with which it is connected by a branch railway. It was occupied by Hari Singh, Ranjit Singh's commander in 1836; but in April 1837 Dost Mohammed sent a body of Afghans to attack it. The Sikhs gained a doubtful victory, with the loss of...
their general. During the military operations of 1878–79
Jamrud became a place of considerable importance as the
frontier outpost on British territory towards Afghanistan, and
it was also the base of operations for a portion of the Tirah
campaign in 1897–98. It is the headquarters of the Khyber
Rifles, and the collecting station for the Khyber tolls. Pop.
(1901), 1,484.

JAMS AND JELLIES. In the article Food Preservation
it is pointed out that concentrated sugar solution inhibits the
growth of organisms and has, therefore, a preservative action.
The preparation of jams and jellies is based upon that fact. All
fresh and succulent fruit contains a large percentage of water,
amounting to at least four-fifths of the whole, and a compara-
tively small proportion of sugar, not exceeding as a rule from
10 to 15%. Such fruit is naturally liable to decomposition
unless the greater proportion of the water is removed or the
percentage of sugar is greatly increased. The jams and jellies
of commerce are fruit preserves containing so much added sugar
that the total amount of sugar forms about two-thirds of the
weight of the articles. All ordinary edible fruit can be and is
made into jam. The fruit is sometimes pulped and stained,
sometimes used whole and unbroken; oranges are sliced or
shredded. For the preparation of jellies only certain fruit is
suitable, namely such as contains a peculiar material which on
boiling becomes dissolved and on cooling solidifies with the
formation of a gelatinous mass. This material, often called
pectin, occurs mainly in comparatively acid fruit like goose-
berries, currants and apples, and is almost absent from straw-
berries and raspberries. It is chemically a member of the group
of carbohydrates, is closely allied with vegetable gums abun-
dantly formed by certain sea-weeds and mosses (agar-agar or
Iceland moss), and is probably a mixture of various pentoses.
Pentoses are devoid of food-value, but, like animal gelatine,
with which they are in no way related, can form vehicles for
food material. Some degree of gelatinization is aimed at also
in jams; hence to such fruits as have no gelatinizing power an
addition of apple or gooseberry juice, or even of Iceland moss or
agar-agar, is made. Animal gelatine is very rarely used.

The art of jam and jelly making was formerly domestic, but
has become a very large branch of manufacture. For the
production of a thoroughly satisfactory conserve the boiling-
down must be carried out very rapidly, so that the natural
colour of the fruit shall be little affected. Considerable expe-
rience is required to stop at the right point; too short boiling
leaves with a sour taste, while long boiling, especially with
concentration promotes crystallization of the sugar. The
manufactured product is on that account, as a rule, more uniform
and bright than the domestic article. The finish of the boiling
is mostly judged by rule of thumb, but in some scientifically
conducted factories careful thermometric observation is em-
ployed. Formerly jams and jellies consisted of nothing but
fruit and sugar; now starch-glucose is frequently used by
manufacturers as an ingredient. This permits of the produc-
tion of a slightly more aqueous and gelatinous product, alleged also
to be devoid of crystallizing power, as compared with the home-
made article. The addition of starch-glucose is not held to be
an adulteration. Aniline colours are very frequently used by
manufacturers to enhance the colour, and the effect of an excess
of water is sometimes to be counteracted by the addition of some
salicylic acid or other preservative. There has long been, and
still exists to some extent, a popular prejudice in favour of sugar
obtained from the sugar-beet as compared with that of the
sugar-beet. This prejudice is absolutely baseless, and enormous
quantities of beet-sugar are used in the boiling of jam. Adul-
teration in the gross sense, such as a substantial addition of coarse
pulp, like that of turnips or mangolds, very rarely occurs;
but the pulp of apple and other cheap fruit is often admired
without notice to the purchaser. The use of colouring matters
and preservatives is discussed at length in the article
Adulteration.

JANESVILLE, a city and the county-seat of Rock County,
Wisconsin, U.S.A., situated on both sides of the Rock river,
one of his journeys a curious windfall, a country house at Lucca, in a lottery, and wrote accounts of his travels; he wrote numerous tales and novels, and composed many other works, of which, by far the best is the *Fin d'un monde et du nez de Rameau* (1861), in which, under the guise of a sequel to Diderot's masterpiece, he showed his great familiarity with the late 18th century. He married in 1841; his wife had money, and he was always in easy circumstances. In the early part of his career he had many quarrels, notably one with Félix Pyat (1870–1880), whom he prosecuted successfully for defamation of character. For the most part his work is mere improvisation, and has few elements of vitality except a light and vivid style. His *Œuvres choisies* (12 vols., 1875–1878) were edited by A. de la Fizletière.

A study on Janin with a bibliography was published by A. Pédag- nel in 1874. See also Sainte-Beuve, *Causiers du lundi*, ii. and v., and Gustave Planche, *Portraits littéraires*.

**JANISSARIES** (corrupted from Turkish *yeni chiri*, new troops), an organized military force constituting until 1826 the standing army of the Ottoman empire. At the outset of her history Turkey possessed no standing army. All Moslems capable of bearing arms served as a kind of volunteer yeomanry known as *ağkisim*; they were summoned by publiccriers, or, if the occasion required, by secret messengers. It was under the Oktaham, a regular paid army, first organized: the soldiers were known as *yoya* or *piyadet*. The result was unsatisfactory, as the Turcomans, from whom these troops were recruited, were unaccustomed to act on foot or to submit to military discipline. Accordingly in 1330, on the advice of Chenderelı Khalı Khalı, the system known as *denshürme* or forced levy, was adopted, whereby a certain number of Christian youths (at first 1000) were every year taken from their parents, and after undergoing a period of apprenticeship, were enrolled as *yeni chiri* or new troops. The venerable saint Haji Bektash, founder of the Bektashi dervishes, blessed the corps and promised them victory; he remained ever after the patron saint of the janissaries.

At first the corps was exclusively recruited by the forced levy of Christian children, for which purpose the officer known as *tournadj-bashi*, or head-keeper of the cranes, made periodical tours in the provinces. The fixed organization of the corps dates only from Mahomed II., and its regulations were subsequently modified by Suleiman I. In early days all Christians were enrolled indiscriminately; later those from Albania, Bosnia and Bulgaria were preferred. The recruits while serving their apprenticeship were instructed in the principles of the faith by *koyos*, but according to D’Ohsson (vii. 327) they were not obliged to become Moslems.

The entire corps, commanded by the aga of the janissaries, was known as the *ojak* (hearth); it was divided into *ortos* or units of varying numbers; the *oda* (room) was the name given to the barracks in which the janissaries were lodged. There were, after the reorganization of Suleiman I., 106 ortas of three classes, viz. the *jemaat*, comprising 101 ortas, the *beulak*, 61 ortas, and the *sekban*, or *seimen*, 34 ortas; to these must be added 34 ortas of *ajomi* or apprentices. The strength of the orta varied greatly, sometimes being as low as 100, sometimes rising considerably beyond its nominal war strength of 500. The distinction between the different classes seems to have been principally in name; in theory the jemaat, or *yoya beller*, were specially charged with the duty of frontier-guards; the *beulaks* had the privilege of serving as the sultan’s guards and of keeping the sacred banner in their custody.

Until the accession of Murad III. (1574) the total effective of the janissaries, including the ajami or apprentices, did not exceed 20,000. In 1582 irregularities in the mode of admission to the ranks began. Soon parents themselves begged to have their children enrolled, so great were the privileges attaching to the corps; later the privilege of enlistment was restricted to the children or relatives of former janissaries; eventually the regulations were much relaxed, and any person was admitted, only negroes being excluded. In 1591 the ojak numbered 48,688 men. Under Ibrahim (1640–1648) it was reduced by Kara Mustafa to 17,000; but it soon rose again, and at the accession of Mahommed IV. (1648), the accession-bakshish was distributed to 50,000 janissaries. During the war of 1683–1689 the rules for admission were suspended, 30,000 recruits being received at one time, and the effective of the corps rising to 70,000; about 1805 it numbered more than 112,000; it went on increasing until the destruction of the janissaries, when it reached 135,000. It would perhaps be more correct to say that these are the numbers figuring on the pay-sheets, and that they doubtless largely exceed the total of the men actually serving in the ranks.

Promotion to the rank of warrant officer was obtained by long or distinguished service; it was by seniority up to the rank of *odabashi*, but odabashis were promoted to the rank of *chorbajı* (commander of an orta) solely by selection. Janissaries advanced in their own orta, which they left only to assume the command of another. Ortas remained permanently stationed in the fortress towns in which they were in garrison, being displaced in time of peace only when some violent animosity broke out between two companies. There were usually 12 in garrison at Belgrade, 14 at Khotin, 16 at Widdin, 20 at Bagdad, &c. The commander was frequently changed. A new chorbajı was usually appointed to the command of an orta stationed at a frontier post; he was then transferred elsewhere, so that in course of time he passed through different stations.

In time of peace the janissary received no pay. At first his war pay was limited to one asper per diem, but it was eventually raised to a minimum of three aspers, while veterans received as much as 20 aspers, and retired officers from 30 to 120. The aga received 24,000 piastres per annum; the ordinary pay of a commander was 120 aspers per day. The aga and several of his subordinates received a percentage of the pay and allowance of the troops; they also inherited the property of deceased janissaries. Moreover, the officers profited largely by retaining the names of dead or fictitious janissaries on the pay-rolls. Rations of mutton, bread and candles were furnished by the government, the supply of rice, butter and vegetables being at the charge of the commandant. The rations would have been entirely inadequate if the janissaries had not been allowed, contrary to the regulations, to pursue different callings, such as those of baker, butcher, glazier, boatman, &c. At first the janissaries bore no other distinctive mark save the white felt cap. Soon the red cap with gold embroidery was substituted. The uniform of the janissaries was white, the salesman was not the colour than the cut of the coat and the shape of the turban. The only distinction in the costume of commanding officers was in the colour of their boots, those of the beulaks being red while the others were yellow; subordinate officers wore black boots.

The fundamental laws of the janissaries, which were very early infringed, were as follows: implicit obedience to their officers; perfect accord and union among themselves; abstinence from luxury, extravagance and practices unseemly for a soldier and a brave man; observance of the rules of Haji Bektash and of the religious law; exclusion from the ranks of all save those properly levied; special rules for the infliction of the death-penalty; promotion to be seniority; janissaries to be admonished or punished by their own officers only; the infirm and unfit to be pensioned; janissaries were not to let their beards grow, not to marry, nor to leave their barracks, nor to engage in trade; but were to spend their time in drill and in practising the arts of war.

At some of these the state supplied no arms, and the janissaries on service in the capital were armed only with clubs; they were forbidden to carry any arm save a cutlass, the only exception being at the frontier-posts. In time of war the janissaries provided their own arms, and these might be any which took their fancy. However, they were induced by rivalry to procure the best obtainable and to keep them in perfect order. The uniform of the janissaries was of white silk on which verses from the Koran were embroidered in gold. This banner was planted beside the aga’s tent in camp, with four other flags in red cases, and his three horse-tails. Each orta had its flag, half-red and
half-yellow, placed before the tent of its commander. Each orla had two or three great caldrons used for boiling the soup and pilaw; these were under the guard of subordinate officers. A particular superstition attached to them: if they were lost in battle all the officers were disgraced, and the orla was no longer allowed to parade with its caldrons in public ceremonies. The janissaries were stationed in most of the guard-houses of Constantinople and other large towns. No sentries were on duty, but rounds were sent out two or three times a day. It was customary for the sultan or the grand vizier to bestow largesses on an orla which they might visit.

The janissaries conducted themselves with extreme violence and brutality towards civilians. They extorted money from them on every possible pretext: thus, it was their duty to sweep the streets in the immediate vicinity of their barracks, but they forced the civilians, especially if rayas, to perform this task or to pay a bribe. They were themselves subject to severe corporeal punishments; if these were to take place publicly the ojak was first asked for its consent.

At first a source of strength to Turkey as being the only well-organized and disciplined force in the country, the janissaries soon degenerated into a lawless and extravagant body. One frequent means of exhibiting their discontent was to set fire to Constantinople; 140 such fires are said to have been caused during the 28 years of Ahmed III's reign. The janissaries were at all times distinguished for their want of respect towards the sultans; their outbreaks were never due to a real desire for reforms of abuses or of misgovernment, but were solely caused to obtain the downfall of some obnoxious minister.

The first recorded revolt of the janissaries is in 1443, on the occasion of the second accession of Mahomed II, when they broke into rebellion at Adrianople. A similar revolt happened at his death, when Bayazid II. was forced to yield to their demands and thus the custom of the accession-bakshish was established; at the end of his reign it was the janissaries who forced Bayazid to summon Prince Selim and to hand over the reins of power to him. During the Persian campaign of Selim I. they mutinied more than once. Under Osman II. their disorders reached their greatest height and led to the dethronement and murder of the sultan. It would be tedious to recall all their acts of mischief throughout Turkey, but they have made use of instruments by unscrupulous and ambitious statesmen, and in the 17th century they had become a praetorian guard in the worst sense of the word. Sultan Selim III. in despair endeavoured to organize a properly drilled and disciplined force, under the name of nizam-i-jedid, to take their place; for some time the janissaries regarded this attempt in sullen silence; a curious detail is that Napoleon's ambassador Sebastiani strongly dissuaded the sultan from taking this step. Again serving as tools, the janissaries dethroned Selim III. and obtained the abolition of the nizam-i-jedid. But after the successful revolution of Bairakdar Pasha of Widdin the new troops were re-established and drilled: the resentment of the janissaries rose to such a height that they attacked the grand vizier's house, and after destroying it marched against the sultan's palace. They were repulsed by cannon, losing 600 men in the affair (1806). But such was the excitement and alarm caused at Constantinople that the nizam-i-jedid, or sebans as they were now called, had to be suspended. During the next 20 years the misdeeds and turbulence of the janissaries knew no bounds. Sultan Mahomed II. was powerfully impressed by their violence and lawlessness at his accession, and with the example of Mehemet Ali's method of suppressing the Mamlukes before his eyes, determined to rid the state of this scourge; long biding his time, in 1825 he decided to form a corps of regular drilled troops known as askeriyes. A fetha was obtained from the Sheikh-ul-Islam to the effect that it was the duty of Moslems to acquire military science. The imperial decree announcing the formation of the new troops was promulgated at a grand council, and the high dignitaries present (including certain of the principal officers of the janissaries who concurred) undertook to comply with its provisions. But the janissaries rose in revolt, and on the 10th of June 1826, began to collect on the Et Meidan square at Constantinople; at midnight they attacked the house of the aga of janissaries, and, finding he had made good his escape, proceeded to overturn the caldrons of as many orlas as they could find, thus forcing the troops of those orlas to join the insurrection. Then they pillaged and robbed throughout the town. Meanwhile the government was collecting its forces; the ulama, consulted by the sultan, gave the following fetva: "If unjust and violent men attack their brethren, fight against the aggressors and send them before their natural judge!" On this the sacred standard of the prophet was unfurled, and war was formally declared against these disturbers of order. Cannon were brought against the Et Meidan, which was surrounded by troops. Ibrahim Aga, known as Kara Jehennum, the commander of the artillery, made a last appeal to the janissaries to surrender; they refused, and fire was opened upon them. Such as escaped were shot down as they fled; the barracks where many found refuge were burnt; those who were taken prisoner were brought before the grand vizier and hanged. Before many days were over the corps had ceased to exist, and the janissaries, the glory of Turkey's early days and the scourge of the country for the last two centuries, had passed from the stage.

See M. d'Ohsson, Tableaux de l'empire ottoman (Paris, 1787-1820); Ahmed Vefyck, Lelh-i-osmanli (Constantinople, 1790-1874); A. Djévad Bey, État militaire ottoman (Constantinople, 1885).

JANIUAY, a town of the province of Iloilo, Panay, Philippine Islands, on the Suque river, about 20 m. W.W.N. of Iloilo, the capital. Pop. (1893), 27,399, including Lambháno (6661) annexed to Janiuay in 1903. The town commands delightful views of mountain and valley scenery. An excellent road connects it with Pototan, about 10 m. E. The surrounding country is hilly but fertile and well cultivated, producing rice, sugar, tobacco, vegetables (for the Iloilo market), hemp and Indian corn. The women weave and sell beautiful fabrics of pina, silk, cotton and abaca. The language is Panay-Visayan. Janiuay was founded in 1758; it was first established in the mountains and was subsequently removed to its present site.

JANJIRA, a native state of India, in the Konkan division of Bombay, situated along the coast among the spurs of the Western Ghats, 40 m. S. of Bombay city. Area, 324 sq. m. Pop. (1901), 83,414, showing an increase of 4% in the decade. The estimated revenue is about £2,700,000; there is no tribute. The chief, whose title is Nawab Sahib, is by descent a Sidi or Abyssinian Mahomedan; and his ancestors were for many generations admirals of the Mahomedan rulers of the Deccan. The state, popularly known as Habsan (= Abyssinian), did not come under direct subordination to the British until 1870. It supplies sailors and fishermen, and also firewood, to Bombay, with which it is in regular communication by steamer.

The Nawab of Janjira is also chief of the state of Jafarabad (q.v.).

JAN MAYEN, an arctic island between Greenland and the north of Norway, about 72°N. 8°W. It is 34 m. long and 9 m. in greatest breadth, and is divided into two parts by a narrow isthmus. The island is of volcanic formation and mountainous, the highest summit being Beerenberg in the north (8350 ft.). Volcanic eruptions have been observed. Glaciers are fully developed. Henry Hudson discovered the island in 1609 and called it Hudson's Turtles or Touches. Thereafter it was several times visited by navigators who successively claimed it as a discovery and resided on it. In 1613, 1615, 1616, or the following year whalers from Hull named it Trinity Island; in 1612 Jean Vrolicoq, a French whaler, called it Île de Richelieu; and in 1614 Joris Carolus named one of its promontories Jan Meys Hoek after the captain of one of his ships. The present name of the island is derived from this, the claim of its discovery by a Dutch navigator, Jan Mayen, in 1611, being unsupported. The island is not permanently inhabited, but has been frequently visited by explorers, sealers and whalers; and an Austrian station for scientific observations was maintained here for a year in 1882-1883. During this period a mean temperature of 27-8°F. was recorded.
JANSEN, CORNELIUS (1585–1638), bishop of Ypres, and father of the religious revival known as Jansenism, was born of humble Catholic parentage at Accoy in the province of Utrecht on the 28th of October 1585. In 1602 he entered the university of Louvain, then in the throes of a violent conflict between the Jesuit, or scholastic, party and the followers of Michael Baisus, who wrote by St Augustine. Jansen ended by attaching himself strongly to the latter party, and presently made a momentous friendship with a like-minded fellow-student, Du Vergier de Hauranne, afterwards abbot of Saint Cyran. After taking his degree he went to Paris, partly to recruit his health by a change of scene, partly to study Greek. Eventually he joined Du Vergier at his country home near Bayonne, and spent some years teaching at the bishop's college. All his spare time was spent in studying the early Fathers with Du Vergier, and laying plans for a reformation of the Church. In 1616 he returned to Louvain, to take charge of the college of St Puleheria, a hostel for Dutch students of theology. Pupils found him a somewhat choleric and exacting master and academic society a great recluse. However, he took an active part in the university's resistance to the Jesuits; for these had established a theological school of their own in Louvain, which was proving a formidable rival to the official faculty of divinity. In the hope of repressing their encroachments, Jansen was sent twice to Madrid, in 1624 and 1626; the second time he narrowly escaped the Inquisition. He warmly supported the Catholic missionary bishop of Holland, Rovenius, in his contests with the Jesuits, who were trying to evangelize that country without regard to the bishop's wishes. He also crossed swords more than once with the Dutch Presbyterian champion, Vossius, still remembered for his attacks on Descartes. Antipathy to the Jesuits brought Jansen no nearer Protestantism; on the contrary, he yearned to beat these by their own weapons, chiefly by showing them that Catholics could interpret the Bible in a manner quite as mystical and pietistic as theirs. This became the great object of his lectures, when he was appointed regius professor of scriptural interpretation at Louvain in 1620. Still more was it the object of his *Augustinus*, a bulky treatise on the theology of St Augustine, barely finished at the time of his death. Preparing it had been his chief occupation ever since he went back to Louvain. But Jansen, as he said, did not mean to be a school-pedant all his life; and there were moments when he dreamt of political dreams. He looked forward to a time when Belgium should throw off the Spanish yoke and become an independent Catholic republic on the model of Protestant Holland. These ideas became known to his Spanish rulers, and to assuage them he wrote a philippic called the *Mars gallicus* (1635), a violent attack on French ambitions generally, and on Richelieu's indifference to international Catholic interests in particular. The *Mars gallicus* did not do much to help Jansen's friends in France, but it more than appeased the wrath of Madrid with Jansen himself; in 1636 he was appointed bishop of Ypres. Within two years he was cut off by a sudden illness on the 4th of May 1638; the *Augustinus*, the book of his life, was published posthumously in 1640.

Full details as to Jansen's career will be found in Reuchlin's *Geschichte von Port Royal* (Hamburg, 1839), vol. i. See also *Jansenius* by the Abbés Callaert and Nols (Louvain, 1893). (ST C.)

**JANSENISM**, the religious principles laid down by Cornelius Jansen in his *Augustinus*. This was simply a digest of the teaching of St Augustine, drawn up with a special eye to the needs of the 17th century. In Jansen's opinion the church was suffering from three evils. The official scholastic theology was anything but evangelical. Having set out to embody the mysteries of faith in human language, it had fallen a victim to the excellence of its own methods; language proved too strong for mystery. Theology sank into a formless doctrine; whatever would not fit in with a logical formula was cast aside as useless. But average human nature does not take kindly to a syllogism, and theology had ceased to have any appreciable influence on popular religion. Simple souls found their spiritual pastime in little mining "devotions"; while robuster minds built up for themselves a natural moralistic religion, quite as close to Epicurus as to Christianity. All these three evils were attacked by Jansen. As against the theologians, he urged that in a spiritual religion experience, not reason, must be our guide. As against the stoical self-sufficiency of the moralists, he dwelt on the helplessness of man and his dependence on his maker. As against the ceremonialists, he maintained that no amount of church-going will save a man, unless the love of God is in him. But this capacity for love no one can give himself. If he is born without the religious instinct, he can only receive it by going through a process of "conversion." And whether God converts this man or that depends on his good pleasure. Thus Jansen's theories of conversion melt into predestination; although, in doing so, they somewhat modify its grimness. Even for the worst miscreant there is hope—for who can say that but God may yet think fit to convert him? Jansen's thoughts went back every moment to his two spiritual heroes, St Augustine and St Paul, each of whom had been "the chief of sinners."

Such doctrines have a marked analogy to those of Calvin; but in many ways Jansen differed widely from the Protestants. He vehemently rejected their doctrine of justification by faith; conversion might be instantaneous, but it was only the beginning of a long and gradual process of justification. Secondly, although the one thing necessary in religion was a personal relation of the human soul to its maker, Jansen held that that relation was only possible in and through the Roman Church. Herein he was following Augustine, who had managed to couple together a high theory of church authority and sacramental grace with a strongly personal religion. But the circumstances of the 17th century were not those of the 5th; and Jansen landed his followers in an inextricable confusion. What were they to do, when the outward church said one thing, and the inward voice said another? Some time went by, however, before the two authorities came into open conflict. Jansen's ideas were popularized in France by his friend Du Vergier, who left the St Cyran and he dwelt mainly on the practical side of the matter—on the necessity of conversion and love of God, as the basis of the religious life. This brought him into conflict with the Jesuits, whom he accused of giving absolution much too easily, without any serious inquiry into the dispositions of their penitent. His views are expounded at length by his disciple, Antoine Arnauld, in a book on *Frequent Communion* (1643). This book was the first manifestation of Jansenism to the general public in France, and raised a violent storm. But many divines supported Arnauld; and no official action was taken against his party till 1649. In that year the Paris University condemned five propositions from Jansen's *Augustinus*, all relative to predestination. This censure, backed by the signatures of eighty-five bishops, was sent up to Rome for endorsement; and in 1653 Pope Innocent X. declared all five propositions heretical.

This decree placed the Jansenists between two fires; for although the five propositions only represented one side of Jansen's teaching, it was recognized by both parties that the whole question was to be fought out on this issue. Under the leadership of Arnauld, who came of a great family of lawyers, the Jansenists accordingly took refuge in a series of legal tactics. Firstly, they denied that Jansen had meant the propositions in the sense condemned. Alexander VII. replied (1656) that his predecessor had condemned them in the sense intended by their author. Arnauld retorted that the church might be infallible in abstract questions of theology; but as to what was passing through an author's mind it knew no more than any one else. However, the French government supported the pope. In 1656 Arnauld was deprived of his degree, in spite of Pascal's *Provincial Letters* (1656–1657), begun in an attempt to save him (see PASCAL; CASUISTRY). In 1661 a formulary, or solemn renunciation of Jansen, was imposed on all his suspected followers; those who would not sign it went into hiding, or to the Bastille. Peace was only restored under Clement IX. in 1669.

This peace was treated by Jansenist writers as a triumph; really it was the beginning of their downfall. They had set out
to reform the Church of Rome; they ended by having to fight hard for a doubtful foothold within it. Even that foothold soon gave way. Louis XIV. was a fanatic for uniformity, civil and religious; the last thing he was likely to tolerate was a handful of eccentric recusants, who believed themselves to be in special touch with Heaven, and therefore might at any moment set their conscience up against the law. During the lifetime of his cousin, Madame de Longueville, the great protectress of the Jansenists, Louis stayed his hand; on her death (1679) the reign of severity began. That summer Arnauld, who had spent the greater part of his life in hiding, was forced to leave France for good.

Six years later he was joined in exile by Pasquier Quesnel who succeeded him as leader of the party. Long before his flight from France Quesnel had published a devotional commentary on the Book of Job—Les Janssens et le Livre de Job (1685). This little work, which had gone through many editions without exciting official suspicion. But in 1695 Louis Antoine de Noailles, bishop of Châlons, was made archbishop of Paris. He was known to be very hostile to the Jesuits, and at Châlons had more than once expressed official approval of Quesnel's Réflexions. So the Jesuit party determined to wreck archbishop and book at the same time. The Jansenists played into their hands by suddenly raising (1701) in the Paris divinity school the question whether it was necessary to accept the condemnation of Jansen with interior assent, or whether a "respectful silence" was enough. Very soon ecclesiastical France was in a blaze. In 1703 Louis XIV. wrote to Pope Clement XI., proposing that they should take joint action to "put an end to their Jansenian philosophy" with a bull condemning respectful silence. This measure only whetted Louis's appetite. He was growing old and increasingly superstitious; the affairs of his realm were going from bad to worse; he became frenziedly anxious to propitiate the wrath of his maker by making war on the enemies of the Church. In 1711 he asked the pope for a second, and still stronger bull, that would tear up Jansenism by the roots. The pope's choice of a book to condemn fell on Quesnel's Réflexions; in 1713 appeared the bull Unigenitus, anathematizing no less than one-hundred-and-one of its propositions. Indeed, in his zeal against the Jansenists the pope condemned various practices in no way peculiar to their party; thus, for instance, many orthodox Catholics were exasperated at the heavy blow he dealt at popular books which he held as a direct upshot from Archbishop de Noailles and others who did not call themselves Jansenists. In the midst of the conflict Louis XIV. died (September 1715); but the freethinking duke of Orleans, who succeeded him as regent, continued after some wavering to support the bull. Thereupon four bishops appealed against it to a general council; and the country became divided into "appellant" and "acceptant." (1717) The regent's disreputable minister, Cardinal Dubois, patched up an abstruse truce in 1720, but the appellants promptly "re-appealed" against it. During the next ten years, however, they were slowly crushed, and in 1730 the Unigenitus was proclaimed part and parcel of the law of France. This led to a great quarrel with the judges, who were insensitive to Gallican but put up with Gallic opposition from Archbishop de Noailles and others who did not call themselves Jansenists.

Meanwhile the most ardent Jansenists had followed Quesnel to Holland. Here they met with a warm welcome from the Dutch Catholic body, which had always been in close sympathy with Jansenism, although without regarding itself as formally pledged to the Augustinus. But it had broken loose from Rome in 1702, and was now organizing itself into an independent church (see Urrecht). The Jansenists who remained in France had meanwhile fallen on evil days. Persecution usually begots hysteria in its victims; and the more extravagant members of the party, who had often wandered far afield to apocalyptic prophecy and "speaking with tongues," About 1728 the miracles of St. Médard became the talk of Paris. This was the cemetery where was buried François de Paris, a young Jansenist deacon of singularly holy life, and a erstwhile opponent of the Unigenitus. All sorts of miraculous cures were believed to have been worked at his tomb, until the government closed the cemetery in 1732. This gave rise to the famous epigrams:

"De par le roi, défense à Dieu
De faire miracle en ce lieu.

On the miracles soon followed the rise of the so-called Convulsionaries. These worked themselves up, mainly by the use of frightful self-tortures, into a state of frenzy, in which they prophesied and cured diseases. They were eventually disowned by the more reputable Jansenists, and were severely repressed by the police. But in 1772 they were still important enough for Diderot to enter the field against them. Meanwhile genuine Jansenism survived in many country parsonages and convents, and led to frequent quarrels with the authorities. Only one of its latter-day disciples, however, rose to real eminence; this was the Abbé Henri Grégoire, who played a considerable part in the French Revolution. A few small Jansenist congregations still survive in France; and others have been started in connexion with the Old Catholic Church in Holland.

LITERATURE.—For the 18th century see the Port Royal of Sainte-Beuve (5th ed., Paris, 1892) in six volumes. See also H. Reuchlin, Geschichte von Port Royal (2 vols., Hamburg, 1839-1844), and A. Janssens, Port Royal theological commentaries (5 vols., London, 1801). No satisfactory Roman Catholic history of the subject exists, though reference may be made to Count Joseph de Maistre's De l'église gallicane (last ed., Lyons, 1881). On the Jansenism of the 18th century no single work exists, though much information will be found in the Gallican Church of Canon Jervis (2 vols., London, 1872). For a series of excellent sketches see also Seiche, Les Derniers Jansénistes (3 vols., Paris, 1891). A more detailed list of books bearing on the subject will be found in the 5th volume of the Cambridge Modem History; and J. Paquier's Le Jansénisme (Paris, 1900) may also be consulted.

—(St. C.)

JANSSEN, or Jansen (sometimes Johnson), CORNELIUS (1593-1664), Flemish painter, was apparently born in London, and baptized on the 14th of October 1593. There seems no reason to suppose, as was formerly stated, that he was born at Amsterdam. He worked in England from 1618 to 1643, and afterwards retired to Holland, working at Middelburg, Amsterdam, The Hague and Utrecht, and dying at one of the last two places about 1664. In England he was patronized by James I. and the court, and under Charles I. he continued to paint the numerous portraits which adorn many English mansions and collections. Jansen's pictures, chiefly portraits, are distinguished by clearness and grace, and great care and careful finish. He generally painted upon panel, and often worked on a small scale, sometimes producing replicas of his larger works. A characteristic of his style is the very dark background, which throws the carnations of his portraits into rounded relief. In all probability his earliest portrait (1618) was that of John Milton as a boy of ten.

JANSSEN, JOHANNES (1829-1891), German historian, was born at Xanten on the 10th of April 1829, and was educated as a Roman Catholic at Münster, Louvain, Bonn and Berlin, afterwards becoming a teacher of history at Frankfort-on-the-Main. He was ordained priest in 1866; became a member of the Prussian Chamber of Deputies in 1875; and in 1880 was made domestic prelate to the pope and apostolic prothonotary. He died at Frankfort on the 24th of December 1891. Jansen was a stout champion of the Ultramontane party in the Roman Catholic Church. His great work is his Geschichte des deutschen Volkes seit dem Ausgang des Mittelalters (8 vols., Freiburg, 1878-1894). In this book he shows himself very hostile to the Reformation, and attempts to prove that the Protestants were responsible for the general unrest in Germany during the 16th and 17th centuries. The author's partisanship led to some controversy, and Janssen wrote An meine Kritiker (Freiburg, 1882) and Ein zweites Wort an meine Kritiker (Freiburg, 1883) in reply to the Janssens Geschichte des deutschen Volkes (Munich, 1883) of M. Lenz, and other criticisms.

The Geschichte, which has passed through numerous editions, has been continued and improved by Ludwig Pastor, and the greater part of it has been translated into English by M. A. Mitchell and A. M.
JANSSEN, P. J. C.—JANUS

155

In bold composition and in treatment of the nude he equalled him; but in faculty of colour and in general freedom of disposition and touch he fell far short. A master of chiaroscuro, he gratified his taste for strong contrasts of light and shade in his torchlights and similar effects. Good examples of this master are to be seen in the Antwerp museum and the Vienna gallery. The stories of his jealousy of Rubens and of his dissolute life are quite unfounded. He died at Antwerp in 1632.

JANUARIUS, ST, or SAN G E N N A R O, the patron saint of Naples. According to the legend, he was bishop of Benevento, and flourished towards the close of the 3rd century. On the outbreak of the persecution by Diocletian and Maximian, he was taken to Nola and brought before Timotheus, governor of Campania, on account of his profession of the Christian religion. After various assaults upon his constancy, he was sentenced to be cast into the fiery furnace, through which he passed wholly unharmed. On the following day, along with a number of fellow martyrs, he was exposed to the fury of wild beasts, which, however, laid themselves down in tame submission at his feet. For a second time, again pronouncing sentence of death, was struck with blindness, but immediately healed by the powerful intercession of the saint, a miracle which converted nearly five thousand men on the spot. The ungrateful judge, only roused to further fury by these occurrences, caused the execution of Januarius by the sword to be forthwith carried out. The body was ultimately removed by the inhabitants of Naples to that city, where the relic became very famous for its miracles, especially in countering the more dangerous eruptions of Vesuvius. Whatever the difficulties raised by his Acta, the cult of St Januarius, bishop and martyr, is attested historically at Naples as early as the 5th century (Biblioth. hagiog. latina, No. 6538). Two phials preserved in the cathedral are believed to contain the blood of the martyr. The relic is shown twice a year—in May and September. On these occasions the substance contained in the phial liquefies, and the Neapolitans see in this phenomenon a supernatural manifestation. The "miracle of St Januarius" did not occur before the middle of the 15th century.

A great number of saints of the name of Januarius are mentioned in the martyrologies. The best-known are the Roman martyr (festival, the roth of July), whose epitaph was written by Pope Damasus (De Rossi, Bulletinino, p. 17, 1863), and the martyr of Cordova, who forms along with Faustus and Martialis the group designated by Prudentius (Peristephanon, iv. 20) by the name of tares coronae. The festival of these martyrs is celebrated on the 13th of October.

JANSSEN, PIERRE JULES CÉSAR (1824-1907), French astronomer, was born in Paris on the 22nd of February 1824, and studied mathematics and physics at the faculty of sciences. He taught at the lycée Charlemagne in 1853, and in the school of architecture 1865-1871, but his energies were mainly devoted to various scientific missions entrusted to him. Thus in 1857 he went to Peru in order to determine the magnetic equator; in 1861-1862 and 1864, he studied telluric absorption in the solar spectrum in Italy and Switzerland; in 1867 he carried out optical and magnetic experiments at the poles; he successfully observed both transits of Venus, that of 1874 in Japan, that of 1882 at Oran in Algeria; and he took part in a long series of solar eclipse-expeditions, e.g. to Trani (1867), Guntoo (1868), Algiers (1870), Siam (1875), the Caroline Islands (1883), and to Alicobne in Spain (1905). To see the eclipse of 1870 he escaped from besieged Paris in a balloon. At the great Indian eclipse of 1868 he demonstrated the gaseous nature of the red prominences, and devised a method of observing them under ordinary daylight conditions. One main purpose of his spectroscopic inquiries was to answer the question whether the sun contains oxygen or not. An indispensable preliminary was the virtual elimination of oxygen-absorption in the earth's atmosphere, and his bold project of establishing an observatory on the top of Mont Blanc was prompted by a perception of the advantages to be gained by reducing the thickness of air through which observations have to be made. This observatory, the foundations of which were fixed in the snow that appears to cover the summit to a depth of ten metres, was built in September 1893, and Janssen, in spite of his sixty-nine years, made the ascent and spent four days taking observations. In 1875 he was appointed director of the new astrophysical observatory established by the French government at Meudon, and set on foot there in 1876 the remarkable series of solar photographs collected in his great Atlas de photographies solaires (1904). The first volume of the Annales de l'observatoire de Meudon was published by him in 1896. He died at Paris on the 23rd of December 1907.

See A. M. Clerke, Hist. of Astr. during the 19th Century (1903); H. Macpherson, Astronomers of To-Day (1905).

JANSSENS (or JANSES), VICTOR HONORIUS (1664-1730). Flemish painter, was born at Brussels. After seven years in the studio of an obscure painter named Volders, he spent four years in the household of the duke of Holstein. The next eleven years Janssens passed in Rome, where he took greater advantage of all the aids to artistic study, and formed an intimacy with Tempesta, in whose landscapes he frequently inserted figures. Rising by humble steps to a place among the number of cabinet historians; but, on his return to Brussels, the claims of his increasing family restricted him almost entirely to the larger and more lucrative size of picture, of which very many of the churches and palaces of the Netherlands contain examples. In 1718 Janssens was invited to Vienna, where he stayed three years, and was made painter to the emperor. The statement that he visited England is based only upon the fact that certain fashionable interiors of the time in that country have been attributed to him. Janssens's colouring was good, his touch delicate and his taste refined.

JANSSENS (or JANSES) VAN NUYSSSE, ABRAHAM (1567-1632). Flemish painter, was born at Antwerp in 1567. He studied under Jan Snellinck, who was a "master" in 1602, and in 1607 was dean of the master-painters. Till the appearance of Rubens he was considered perhaps the best historical painter of his time. The styles of the two artists are not unlike. In correctness of drawing Janssens excelled his great contemporary;
of doorways (januae) and in this connexion is the patron of all entrances and beginnings. According to Mommsen, he was "the spirit of opening," and the double-head was connected with the gate that opened both ways. Others, attributing to him an Etruscan origin, regard him as the god of the vault of heaven, which the Etruscan arch is supposed to resemble. The rationalists explained him as an old king of Latium, who built a citadel for himself on the Janiculum. It was believed that his worship, which was said to have existed as a local cult before the foundation of Rome, was introduced there by Romulus, and that a temple was dedicated to him by Numa. This temple, in reality only an arch or gateway (Janus geminus) facing east and west, stood at the north-east end of the forum. It was open during war and closed during peace (Livy i. 12): it was shut only four times before the Christian era. A possible explanation is, that it was considered a bad omen to shut the city gates while the citizens were outside fighting for the state; it was necessary that they should have free access to the city, whether they returned victorious or defeated. Similarly, the door of a private house was kept open while the members of the family were away, but when all were at home it was closed to keep out intruders. There was also a temple of Janus near the theatre of Marcellus, in the forum olitorium, erected by Gaius Duilius (Tacitus, Ann. ii. 49), if not earlier.

The beginning of the day (hence his epithet Matutinus), of the month, and of the year (January) was sacred to Janus; on the 9th of January the festival called Agonia was celebrated in his honour. He was invoked before any other god at the beginning of any important undertaking; his priest was the Rex Sacrorum, the representative of the ancient king in his capacity as religious head of the state. All gateways, house doors and entrances generally, were under his protection; he was the inventor of agriculture (hence Consivius, "he who sows or plants"), of civil laws, of the coinage of money and of religious worship. He was worshipped on the Janiculum as the protector of trade and shipping; his head is found on the obverse, together with the prow of a ship. He is usually represented on the earliest coins with two bearded faces, looking in opposite directions; in the time of Hadrian the number of faces is increased to four. In his capacity as porter or doorkeeper he holds a staff in his right hand, and a key (or keys) in his left; as such he is called Patulcius (opener) and Clusius (closer).

His titles Curitius, Patricius, Quirinus originate in his worship in the gentes, the curiae and the state, and have no reference to any special functions or characteristics. In later times, he is both bearded and unbearded; in place of the staff and keys, the fingers of his right hand show the number 300 (CCC.), those of his left the number of the remaining days of the year (I.B.V.). According to A. B. Cook (Classical Review, xviii. 567), Janus is only another form of Jupiter, the name under which he was worshipped by the pre-Latin (aboriginal) inhabitants of Rome; after their conquest by the Italians, Janus and Jana took their place as independent divinities by the side of the Italian Jupiter and Juno. He considers it probable that the three-headed Janus was a triple oak-god worshipped in the form of two vertical beams and a cross-bar (such as the liegillum sororium, for which see Horatii); hence also the door, consisting of two lintels and side-posts, was sacred to Janus. The three-headed type may have been the original, from which the two-headed and four-headed types were developed. J. G. Frazer (The Early History of the Kingship, pp. 214, 253), who also identifies Janus with Jupiter, is of opinion that Janus was not originally a doorkeeper, but that the door was called after him, not vice versa. Janua may be an adjective, janua foris meaning a door with a symbol of Janus close by the chief entrance, to serve as a protection for the house; then janua alone came to mean a door generally, with or without the symbol of Janus. The double head may have been due to the desire to make the god look both ways for greater protection. By J. Rhys (Hibbert Lectures, 1886, pp. 82, 94) Janus is identified with the three-faced (sometimes three-headed) Celtic god Cernunnos, a chthonian divinity, sometimes compared by Rhys with the Teutonic Heimdral, the warer of the gods of the under-world; like Janus, Cernunnos and Heimdral were considered to be the fons et origo of all things.

JAORA, a native state of Central India, in the Malwa agency. It consists of two isolated tracts, between Ratlam and Neemuch. Area, with the dependencies of Piplhua and Pait Piplaua, 630,000 m. Pop. (1901), 3,42,202. The estimated revenue is Rs. 2,57,000; tribute, Rs. 3,000. The chief, whose title is nawab, is a Mahommedan of Afghan descent. The state was confirmed by the British government in 1818 by the Treaty of Mandeurs. Nawab Mahommehd Ismail, who died in 1895, was an honorary major in the British army. His son, Iftkhar Ali Khan, a minor at his accession, was educated in the Daly College at Indore, with a British officer for his tutor, and received powers of administration in 1906. The chief crops are millets, cotton, maize and poppy. The last supplies a large part of the Malwa opium of commerce. The town of Jaora is on the Rajputana-Malwa railway, 20 m. N. of Ratlam. Pop. (1901), 23,854. It is well laid out, with many good modern buildings, and has a high school and dispensary. To celebrate Queen Victoria's Diamond Jubilee, the Victoria Institute and a zenana dispensary were opened in 1898.

JAPAN, an empire of eastern Asia, and one of the great powers of the world. The following article is divided for convenience into ten sections:—I. Geography; II. The People; III. Language and Literature; IV. Art; V. Economic Conditions; VI. Government and Administration; VII. Religion; VIII. Foreign Intercourse; IX. Domestic History; X. The Claim of Japan.

I. Geography

The continent of Asia stretches two arms into the Pacific Ocean, Kamchatka in the north and Malacca in the south, between which lies a long cluster of islands constituting the Japanese empire, which covers 37° 14' N. of latitude and 20° 11' of longitude. On the north-west are the Kuriles (called by the Japanese Chikskima or the "myriad isles"), which extend to 156° 2' E. and to 50° 56' N.; on the extreme south is Formosa (called by the Japanese Taiwain), which extends to 122° 6' E., and to 21° 45' N. There are six large islands, namely Sakhalin (called by the Japanese Karafuto); Yezo or Ezo (which with the Kuriles is designated Hokkaido, or the north-sea district); Nippon (the "origin of the sun"), which is the main island; Shikoku (the "four provinces"), which lies on the east of Nippon; Kiushiu or Kyushu (the "nine provinces"), which lies on the south of Nippon; and Formosa, which forms the most southerly link of the chain. Formosa and the Pescadores were ceded to Japan by China after the war of 1894-1895, and the southern half of Sakhalin—the part south of 50° N.—was added to Japan by cession from Russia in 1905. Korea, annexed in August 1910, is separately noticed.

Coast-line. — The following table shows the numbers, the lengths of coast-line, and the areas of the various groups of islands only, and not the islands of 20 to 50 in. in length. The total coast-line of 2,018,000 miles, or that, though smaller, are inhabited; except in the case of Formosa and the Pescadores, where the whole numbers are given:—

The Japanese Alps—The Japanese Alps are the highest mountain range in Japan, with peaks reaching over 3,000 m. They are located in the north-central part of the country, primarily in the prefectures of Nagano, Toyama, and Gifu.

depths. Lofty summits are separated by comparatively low branches, which lie at the level of crystalline rocks and schists constituting the original uplands upon which the summits have been piled by volcanic action. The scenery among the mountains is generally barren and stony, there being nothing either rugged or abrupt, until an impression of gentle undulation rather than of grandeur is suggested. Nowhere is the region of eternal snow reached, and masses of foliage enhance the gentle aspect of the landscape. Innumerable local spots of striking brilliancy. The Mountain alternates with valleys, so that not more than one-eighth of the country's entire area is cultivable.

The king of Japanese mountains is Fuji-yama or Fuji-san (pier-1374-83, known as the 'Mount Fuji'. The height is about 3,776 m, or 12,389 ft. above sea-level. The remarkable grace of this moun-

from the summit, but the rest are covered, for the most part, with deep deposits of ashes and scoriae. On the south Fuji slopes unbroken. To the sea, but on the other

the delusion that nature as represented in the classical pictures (byunijusetsu) of China and Japan exists only in the artist's imagination. Further south, in the province of Kai (Koshu), and separating two great rivers, the Fuji-kawa and the Tenri-gawa, there lies a range of hills with peaks of the highest, Mount Fuji-yama, is 3,776 ft. high and two other mountains, Mounts Hida and Ozaya, are 3,249 ft. and 3,013 ft., respectively. Between these ranges and the sea is a belt of lowland, the Kai plain, and the coast of Kai is the longest in Japan. The Pacific Ocean washes the southern and southeastern shores of Kai, the island of Enoshima lies off the coast of the southern part of the province, and the island of Tsushima lies off the northern end of the province.

**Volcanoes.**

Japanese regard it as a sacred mountain, and numbers of pilgrims make the ascent in midsummer. From 500 to 600 ft. is supposed to be the depth of the crater. There are neither sulphur exhalations nor escapes of steam at present, and it would seem that this great volcano is permanently extinct. But experience in other parts of Japan shows that a long quiescent crater may, at any moment burst into disastrous activity. The crater of Japan's written history several eruptions are recorded the last having been in 1707, when the whole summit burst into flame, rocks were shattered, ashes fell to a depth of several inches even in Yedo (Tokyo), 60 m. distant, and the crater poured forth streams of lava. Among still active volcanoes the following are the best known.—

**Name of Volcano.**

**Height in feet.**

**Remarks.**

**Tarumai (Yezo) 2999.**

Forms southern wall of a large ancient crater now occupied by a lake (Shikotsu). A little stream still issues from several smaller cones on the summit of the mound. As well as from one, called Eniwa, on the northern side.

**Noboribetsu 1149.**

(Yezo) In a state of continuous activity, with frequent detonations and rumblings. The crater is divided by a wooded rock-wall. The northern part is occupied by a steaming lake, while the southern part contains numerous small fissures and boiling springs.

**Komagatake 3822.**

(Yezo) The ancient crater-wall, with a lofty pinnacle on the western side, contains a low cone with numerous steaming rits and vents. The crater is occupied by a steaming lake, forming the S.E. flank of the mountain and the country side in that direction were denuded of trees.

**Escan 2067.**

A volcanic promontory at the Pacific end of the Tsugaru Strait: a finely formed cone surrounded on three sides by the sea, the crater breached on the land side. The central vent displays a fountain of grey, white and yellow deposits from numerous fumaroles.

**Agatsuma 5230.**

Bandai-san (Iwahiro) 6037.

Erupted in 1888 after a long period of quiescence. The outburst was preceded by an earthquake of some severity, all of which about 20 explosions took place. A huge avalanche of earth and rocks buried the Nagase Valley with its villages and inhabitants, and destroyed a line of over 27 sq. m. The number of lives lost was 406; four hamlets were completely entombed with their inhabitants and cattle: seven villages were partially wrecked: forests were levelled or the trees entirely denuded of bark; rivers were blocked up, and an ice was formed. The extent of the fracture is now marked by a line of steaming vents.

Long considered extinct, but has erupted several times since 1853. The last eruption having been in 1890, when sulphur-diggers were killed or injured; ashes were thrown to a distance of 5 m., accumulating in places to a depth of 5 ft. and a crater of 20 ft. in diameter, and as many in depth, was formed on the E. side of the mountain. This crater is still active. The summit-crater is occupied by a beautiful lake. On the Fukuishima (E.) side of the volcano rises a large parasitic cone, extinct. The crater on the E. summit is a lakeshore island, and the one on the other side, which rises to a height of 500 ft. above
JAPAN

The surrounding floor is about 2 m.; while the present crater, which displays incessant activity, has itself a diameter of \( \frac{1}{2} \) m. The largest active volcano in Japan, an eruption in 1783, with a deliberate lava, destroyed an extensive forest and overwhelmed several villages. The present cone is the third, portions of two concentric crater rings remaining. The present crater is remarkable for the absolute perpendicularity of its walls, and has an immense depth—from 600 to 800 ft. It is circular, \( \frac{1}{2} \) m. in circumference, with sides honeycombed and burned to a red hue. Japan also experiences a vast number of petty vibrations not perceptible without the aid of delicate instruments. But of earthquakes proper, large or small, she has an exceptional abundance. Thus in the thirty years ending in 1897—that is to say, the first period when really scientific apparatus for recording purposes was available—she was visited by no fewer than 17,750 shocks, being an average of something over 33 daily. The frequency of the phenomena is in some degree a source of security, for the minor vibrations are believed to exercise a binding effect by removing weak cleavages. Nevertheless, the annals show that during the three centuries before 1897 there were 108 earthquakes sufficiently disastrous to merit historical mention. The calculation by which it is said that some of these occurred before the beginning of the Tokugawa administration (early in the 17th century) and therefore in an era when methods of recording were comparatively defective, exact data being naturally lacking. The story, so far as it is known, may be gathered from the following table:

<table>

</table>

(1) An area of over 1,200,000 acres swallowed up by the sea.
(2) Tidal wave killed thousands of people.
(3) Hamana lagoon formed.

In the capital (Tokyo) the average yearly number of shocks throughout the 26 years ending in 1906 was 96, exclusive of minor vibrations, but during the 50 years then ending there were only two severe shocks (1854 and 1864), and they were not directly responsible for any loss of life. The Pacific coast of Japan, however, is more liable than the western shore to shocks disturbing a wide area. Apparent proof has been obtained that the shocks occurring in the Pacific districts originate at the bottom of the sea—the Tsucharomon Deep is supposed to be the centre of subaqueous activity—and they are accompanied in most cases by tidal waves. It seems that late years Tajima, Hida, Kozuke and some other islands in central Japan have enjoyed the greatest immunity, while Musashi (in which province Tōkyō is situated) and Sagami have been most subject to disturbance.

Plains.—Japan, though very mountainous, has many extensive plains. The northern island—Yezo—contains seven, and there are many more in the main and southern islands, to say nothing of flat lands of minor dimensions. The principal are given in the following table:

<table>

Rivers.—Japan is abundantly watered. Probably no country in the world possesses a closer network of streams, supplemented by canals and lakes. But the quantity of water carried seawards varies within wide limits; for whereas, during the summer season, the rivers are less than half filled, in winter and while the snows are melting in spring, great volumes of water sweep down from the mountains, these broad rivers dilate at other times to petty rivulets trickling among a waste of pebbles and boulders. Nor are they as a whole broken by shallows and rapids that navigation is generally impossible except by means of flat-bottomed boats drawing only a few inches. The chief rivers are given in the following table:

Lakes and Waterfalls.—Japan has many lakes, remarkable for the beauty of their scenery rather than for their extent. Some are contained in alluvial depressions in the river valleys or in basins that have been formed by volcanic eruptions, the ejection damming the rivers until exit was found over cliffs or through gorges. Some of these lakes have become favourite summer resorts for foreigners. To that category belong especially the lakes of Hakone, of Chuzenji, of Šōjō, of Inajawasho, and of Biwa. Among these the highest is Lake Chuzenji, which is 4375 ft. above sea-level, has a maximum depth of 32 ft., and contains 15,000 fathoms, and empties itself at one end over a fall (Keōgō) 250 ft. high. The Šōjō lakes lies at a height of 3160 ft., and has between its boulder-boundaries in scenic charms. Lake Hakone is at a height of 2428 ft.; Inajawasho, at a height of 1900 ft., and Biwa at a height of 328 ft. The Japanese associate Lake Biwa (Onmi) with certain special deities, (Omi-no-baakku). Lake Suwa, in Shinano, which is emptied by the Tenri-gawa, has a height of 2624 ft. In the vicinity of many of these mountain lakes thermal springs, with remarkable curative properties, are to be found. (F. B.)

Geology.—It is a popular belief that the islands of Japan consist of the most part of volcanic rocks. But although this conception might reasonably be suggested by the presence of many active and
extinct volcanoes, Professor J. Milne has pointed out that it is literally true of the Kuriles alone, partially true for the southern half of the Main Island and for Kitushu, and quite incorrect as applied to Formosa. Half of the volcanic rocks of the Island and to Shikoku. This authority sums up the geology of Japan thus: "The sedimentary rocks are ... of the Palaeozoic rocks, we meet in many parts of Japan with gneisses and other rocks possibly of Cambrian or Silurian age. Triolobites have been discovered from the Japanese Islands. Carboniferous rocks are represented by mountain masses of Fassian and other limestone basins. This is also amongst the Palaeozoic group an interesting series of red beds containing Radiolari. Mesozoic rocks are represented by shales, sandstones, and Monoids, evidently of Triassic age, and by sandstones, siltstones, and limestones containing Ammonoids. Besides the Palaeozoic and Mesozoic rocks containing Triangia and many other fossils. The Cenozoic or Tertiary rocks are found in the mountain ranges of the empire. They chiefly consist of stratified volcanic rocks of all ages, coal, lignites, fossilized plants and an invertebrate fauna. Diatomaceous earth exists at several places in Yezo. In the alluvium which covers alluvial plains, remains have been discovered of several species of elephants, which, according to Dr. Edmund Naumann, are of Indian origin. The most common eruptive rock is andesite. Some of the Palaeozoic rocks, as basalt, diorite and trachyte are comparatively rare. Quartz porphyry and granitoid rocks are rare. These rocks are generally found in the mountain system of Japan; they may be divided into three main lines. One runs from S.W. to N.E., another from M. to N.E., and the third is meridional. These rocks are all represented by the "northern schist range," and the "snow range," the last consisting mainly of crystalline rocks belonging usually to upper Palaeozoic and Lower Mesozoic sediments. They form the only known occurrence of metamorphic rocks in Japan. The bones of elephants, rhinos, and other animals are found in layers of sedimentary rocks. These bones are often perfectly preserved and show signs of disintegration. The result of the activity of the earth's crust, and the effects of weathering and erosion are well marked in the landscape of Japan. The volcanic rocks are distributed throughout the country, and the products of the eruptions are found in various parts of the country. The volcanic rocks are of two main types: the basaltic and the andesitic. The basaltic rocks are found in the southern part of Kyushu, and consist chiefly of basalt and andesite. The andesitic rocks are found in the central part of Honshu, and consist chiefly of andesite and dacite. The volcanic rocks are of great importance in the economic development of Japan. The basaltic rocks are used as building stones, and the andesitic rocks are used for the production of obsidian, which is used for making tools and weapons. The volcanic rocks are also rich in minerals, such as asbestos, talc, and mica.
Climate.—The large extension of the Japanese islands in a northerly and southerly direction causes great varieties of climate. General characteristics are hot and humid through short summers, and long, cold and clear winters. The equatorial currents produce conditions differing from those existing at corresponding latitudes on the neighbouring continent. In Kitshu, Shikoku and the southern half of the main island, the months of July and August alone are marked by oppressive heat at the sea-level, while in elevated districts a cool and even bracing temperature may always be found, though the direct rays of the sun retain disturbing power. Winter in these districts does not last more than two months, from the end of December to the beginning of March; for although the latter month is not free from frost and even snow, the balminess of spring makes itself plainly perceptible. In the northern half of the main island, in Yezo and in the Kuriles, the cold is severe during the winter, which lasts from four to six months, and snow falls sometimes to great depths. Whereas in Tokyô the number of frosty nights during a year does not average much over 60, the corresponding number in Sapporo on the north-west of Yezo is 145. But the variation of the thermometer in winter and summer being considerable—as much as 72° F. in Tokyô—the climate proves somewhat trying to persons of weak constitution. On the other hand, the mean daily variation is in general less than that in other countries having the same latitude; it is least in January, when it reaches 18°F., and least in July, when it barely exceeds 9°F. The monthly variation is very great in March, when it usually reaches 43°F.

For the first forty years of the Meiji era numerous meteorological stations were established. Reports are constantly forwarded telegraphically by the central observatory in Tokyô, which issues daily statements of the climatic conditions during the previous twenty-four hours, as well as forecasts for the next twenty-four. The whole country is divided into districts for meteorological purposes, and storm-warnings are issued when necessary. At the most important stations observations are taken every hour; at the less important, six observations daily; and at the least important, three observations. From the record of three decades the following yearly averages of temperature are obtained:—

There are three wet seasons in Japan: the first, from the middle of April to the beginning of May; the second, from the middle of June to the beginning of July; and the third, from early in September to early in October. The rainy season lasts from the middle of May till the beginning of August. September is the wettest month. January the driest. During the period from November to February inclusive only about 18% of the whole rain falls for the year. In the district on the east coast, rain and the falling snow is during the winter, and the depth of the snow is usually wrapped in a veil of clouds. These differences are due to the action of the north-westerly wind that blows over Japan from Siberia. The intervening sea being comparatively warm, this wind becomes less cold, and the falling snow is generally accompanied by the carrying moisture which it deposits as snow on the western faces of the Japanese mountains. Crossing the mountains and descending their eastern slopes, the wind becomes less saturated and warmer, so that the formation of clouds is avoided. Hence the precipitation as snow is confined to the western districts. A wet country is one where the average for the whole country is over 1570 mm. per annum. Still there are about four sunny days for every three on which rain or snow falls, the actual figures being 150 days of snow or rain and 215 days of sunshine.

During the cold season, which begins in October and ends in April, northerly and westerly winds prevail throughout Japan. They come from the adjacent seas and develop considerable strength owing to the fact that they have a great difference of pressure of approximately 5 mm. between the southern and the northern end of the country. The southwesterly wind from the warm sea, especially in the vicinity of Luzon. Their season is from June to October, but they occur in other months also, and they develop a velocity of 5 to 75 m. an hour. The meteorological record for ten years shows small variations from the average of 12 annually. September had 14 of these phenomena. March 11 and April 10, leaving 85 for the remaining 9 months. But only 65 out of the whole number developed disastrous force. It is particularly desirable that the South China Sea should be the source of greatest typhoon frequency, for the earlier varieties of rice flower in that month and a heavy storm does much damage. Thus, in 1902—by no means an abnormal year—statistics show the following disasters owing to southwesterly winds: Casualties and loss of life, 2600; casualties and loss of life, 12000; cattle and boats lost, 2344; buildings destroyed wholly or partially, 665,062; land inundated, 1,021, 575 acres; roads destroyed, 1236 m.; bridges washed away, 13,656; embankments broken, 705 m.; crops damaged, 87,615,562; rice crops, including cost of relief, was estimated at nearly 3 millions sterling, which may be regarded as an annual average.

**Flora.** The flora of Japan has been carefully studied by many scientific men from Siebold downwards. Foreigners visiting Japan are immediately struck by the abundance of the people for flowers, trees and natural beauties of every kind. In actual wealth of blossom or dimensions of forest trees the Japanese islands cannot claim credit for a special distinction. The only plants which may be considered as the tints of the foliage in autumn and the flowering trees in the spring. In beauty and variety of pattern and colour the autumnal tints are unsurpassed. The colours pass from deep brown through yellow to white. White flower and white bloom are the result of the dark green of non-decidious shrubs and trees. Oaks and wild prunus, wild vines and sumachs, various kinds of maple, the sandwich Islands, and the bamboo, a wonderful bush which in autumn develops a hue of vivid crimson, are adorned with all kinds of flower and with multitudinous trellises to the brilliance of a spectable which is further enriched by masses of feathery bamboo. The one defect is lack of green sward. The grass used for Japanese lawns loses its verdure in November, and in January turns to a greyishbrown blot on the scene. Spring is supposed to begin in February when, according to the old calendar, the new year sets in, but the only flowers then in bloom are the camellia japonica and some kinds of azalea. The true spring—the period when the flowers may often be seen glowing fiery red amid snow, but the pink (shiro-tsukubaki), white (shiro-tsukubaki) and variegated (shirobo-tsukubaki) kinds do not bloom until March or April. Neither the camellia nor the daphne is regarded as a refined flower; their leaf of shedding their blossoms is too unsightly. Queen of spring flowers is the plum (ume). The tree lends itself with peculiar readiness to the skilful
manipulation of the gardener, and is by him trained into shapes of remarkable grace. Its pure white or rose-red blossoms, heralding the first approach of genial weather, are regarded with special favour and are accounted the symbol of unassuming hardihood. The peony finds many envoys in the Far East; the winter-blooming peony (Eurynome botanica), which is regarded by many Japanese as the king of flowers and is cultivated assiduously. A species of weeping maple (Shidare-momiji) dresses itself in peachy-red foliage and is trained into magnificent shapes, though not without detriment to its longevity. Summer sees the lotus (Ren) convert wide expanses of lake and river into sheets of white and red blossoms; a comparatively flowerless interval ensues until, in October and November, the chrysanthemum arrives to furnish an excuse for fashionable gatherings. With the exception of the dog-days and the dead of winter, there is no season when flowers cease to be an object of attention to the Japanese, nor does any class fail to participate in the season's activities. The remarkable habit of Japanese gardens, from the 16th century onwards, of the art of landscape gardening steadily grew into a science, with esoteric as well as exoteric aspects, and with a special vocabulary. The underlying principle is to re-create on earth the conditions in heaven. The aim is to avoid all scale, so that however restrained the space, there shall be no violation of proportion. Thus the artificial lakes and hills, the stones forming rockeries or simulating solitary crags, the trees and even the bushes are selected and arranged for the occasion. The achievement is marvelously beautiful, though it should be said that the total lack of naturalism in this is a result of the absence of trees and shrubs that would keep them company require much taste and much toil. Thus the gardener, like the poet, must have a poet's eye, and being able to see things as they are, not as they are not, be able to see into the composition of many place-names, an evidence of the people's familiarity with the animal. There are ten species of bat (komori) and seven of insect-eaters, and prominent in this class are the moke (numura) and the hedghog (hari-nemuri). Among the martens there is a weasel (stachi), which, though useful as a rat-killer, has the evil repute of being responsible for sudden and mysterious injuries to human beings; there is a river-otter (kuro- tobi), which, though useful as a fish-killer, is protected by law, and there is the brown bear (Ursus arctos) which, though harmless, is feared by the Japanese as the spirit of the land.<ref>

The investigations of Japanese botanists are adding constantly to the above number, and it is not likely that finality will be reached for some time. According to a comparison made by A. Gray with regard to the numbers of genera and species respectively represented in different regions of the northern hemisphere, the following is the case:

<table>

While there can be no doubt that the luxuriance of Japan's flora is due to rich soil, the high temperatures, and the plenty of water but well distributed over the whole year, the wealth and variety of its trees and shrubs must largely be the result of immigration. Japan has four insular chains which link her to the continent, and through her south border are brought in her within reach of Formosa and the Malayian archipelago; on the west, Okl, Iki, and Tushima bridge the sea between her and Korea; on the north-west Sakhalin connects her with the Amur region; and the southern islets, noted an important route to Kamchatka. By these paths the germs of Asian plants were carried over to join the endemic flora of the country, and all found suitable homes amid greatly varying conditions of climate and physiography.

Flora.—Japan is an exception to the general rule that continents are richer in fauna than are their neighbouring islands. It has been said with truth that "an industrious collector of beetles, butterflies, neuroptera, &c., finds a greater number of species in a square mile near Tockey than are exhibited by the whole British Isles."

Of mammals 50 species have been identified and catalogued. Neither the lion nor the tiger is found. The true Carnivora are three in number: the dog, the bear, and the fox. The dog is not scientifically recognized, but one of them, the ice-bear (Ursus maritimus), is only an accidental visitor, carried down by the Arctic current. In the main island the black bear (kuma, Ursus japonicus) is recognized, and one other, the red bear (called shi-guma, ohi-kuma or aki-kuma), the "grizzly" of North America. The bear does not attract much popular interest in Japan. Tradition centres rather upon the fox (kitten) and the badger (hifikiri) as animals of great courage and sagacity and being worshipped as the messenger of the harvest god, while the latter is regarded as a mischievous rascal. Next to these come the monkey (saru), which dwells equally among the snows of the north and the heat of the south, and is a familiar sight among the gardens. The tame is represented by an abundance of rats, with comparatively few mice, and by the ordinary squeak, to which the people give the name of kabana-murusu (house mouse). The rodentia, which is very striking in some species, are represented by the three-toed sloth (Setis), the spruce marten (Shishi-inu), the ferret (Neko), the young sea otter (Hato), and the Amur wolf (Hato). There are also several species of bats and a number of those species of cats, which, though of scenic beauty, are not valued for their use. The hawk (Shishia) is the recognized symbol of the country, and is found in various numbers, and representatives of all those species of birds which, in an ornithological sense, are known as "mammals." The wild boar (shissho or ni-no-shissho) does not differ appreciably from its European congener. Its flesh is much relished, and for some unexplained reason is called by its vendors "mountain-whale" (Jama-so). A very beautiful stag (shika), with eight-branched antlers, inhabits the remote woodlands, and there are five species of antelope (kamo-shika) which are found in the highest regions. The bear (Ussur), though of recent domestication, has for representatives the horse (sumo), a small beast with little beauty of form though possessing much hardihood and endurance; the ox (tani), mainly a beast of burden or draught; the pig (kuro-na), which is of especial service in the rice-fields, and the brahman (neko), with a stump in lieu of a tail; barndoor fowl (mawo-tori), ducks (shihe), and pigeons (kato). The turkey (shichi-menchou) and the goose (gacho) have been introduced but are little appreciated. Although so-called singing birds exist in tolerable numbers, those whose name of songster are few. Eminently first is a species of nightingale (osugi), which, though smaller than its congener of the same name in Europe, yet has that same melting melody of considerate range. The osugi is a dainty bird in the matter of temperature. After May it retires from the low-lying regions and gradually ascending to higher altitudes as midsummer approaches. In the highlands of the country (chiefly the mountain region called the forest of Utsukus) the limen of its voice is heard as an accompaniment of the osugi, and there are also three other species, the kakhdorei (Cuculus cænus), the tsutsu-dori (C. himalayana), and the manju-karyu (Salvinia niponica), joins its voice, and the cooing of the pigeon (kato) is supplemented by the twitting of the ubiquitous sparrow (susume),
of fishes.

The seas surrounding the Japanese islands may be called a reservoir of
tropical, in that they are rich in tropical species, and there are many fish species
that are found only in Japan. Of the 500 species of fish that are found in the
Japanese waters, over 200 are found nowhere else in the world. These species
include the Pacific cod (Gadus macrocephalus), the Pacific saury (Engraulis
ringens), the Pacific herring (Clupea harengus), the Japanese flounder (Platichthys
flesus), and the Pacific salmon (Oncorhynchus tschawytscha).

Japanese rivers and lakes are the habitat of several—seven or

eight—species of freshwater fish, which live in the
rivers and lakes of Japan. These species include the

Pacific salmon (Oncorhynchus tschawytscha), the

Japanese herring (Clupea harengus), the

Japanese flounder (Platichthys flesus), and the

Japanese pufferfish (Takifugu rubripes).

Japanese rivers and lakes are also the habitat of

multitudes of freshwater mollusks, including

the freshwater mussel (Unio crassus), the

freshwater snail (Planorbis planorbis), and the

freshwater clam (Corbicula fluminea). These species
are found in the rivers and lakes of Japan and
are important as food sources for humans and other
animals.
Japanese archipelago, and several others have since then been added to the list. As for the land and fresh-water molluscs, some 200 of which are known, they are mainly kindred with those of China and Siberia, and the Indian Archipelago being exceptional. There are 57 species of Helix (maisaituburi, dedemski, katatsumaki or beakya), and 25 of Clausilia (kiyura-gai or pipe-snail), including the two largest snails in Japan, namely the Cl. Martensi and the Cl. Vokohamae, which attain to a length of 58 mm. and 44 mm. respectively. The muscula (t-musculus) is in all probability represented by the species numas-gau (marsh-mussel), karas-ga (rauen-mussel), kumasori-gau (razor-mussel), shijimi-no-kai (Corbicula), of which there are nine species, &c. Unlike the land-molluscs, the great majority of Japanese sea-molluscs are akin to those of the Philippine and the Malay Archipelago. Some of them extend westward as far as the Red Sea.

The best known and most frequent forms are the asaris (Tapes philippinarum), the hamaguri (Hamaguri tasiora), the baka (Macra sulcata), the aki-gai (Scapharca inflata), the baka (oyaya), the azabi (Halitosis japonica), the saue (Turbo cornutus), the kora-gai (Tristonium trilobum), &c. Among the cephalopods several are of great value as articles of food, e.g. the urume (Onychocidaris Banksii), the tako (octopus), the shidako (Eledone), the taka (Sepia) and the tako-ta (Argonauta).

Greep enumerates, as denizens of Japanese seas, 26 kinds of sea-urchins (gazei or uni) and 12 of starfish (biodo or tako-no-makura). These, like the molluscs, indicate the influence of the Kuro Shio and the south-west monsoon, for they have close affinity with species found in the Indian and Pacific Oceans. For edible purposes the most valuable of the Japanese echinodermata is the sea-slug or bêche de mer (namako), which is greatly appreciated and sold in the markets as a staple of export to China. Rein writes: "Very remarkable in connexion with the starfishes is the occurrence of Astarias rubens on the Japanese coast; it more frequently displays an almost unexampled frequency and extent of distribution in the whole North Sea, in the western parts of the Baltic, near the Faroe Islands, Iceland, Greenland, and the English coasts, so that it may be regarded as a characteristically North Sea echinoderm form. Towards the south this starfish disappears, it seems, completely; for it is not yet known with certainty to exist either in the Mediterranean or in the southern parts of the Atlantic Ocean. In other asaris rubens is not known, and then it suddenly reappears in Japan. Archeraster typicus has a pretty wide distribution over the Indian Archipel, and Asterideae of Japan, on the other hand, appear to be confined to its shores."

Japanese is not rich in corals and sponges. Her most interesting contributions are crust-coralis (Gorgonidae, Corallium, Ixas, &c.), and especially flint-sponges, called by the Japanese keshi-gai and known as "glass-coni" (Hyalonema simplex). These last have not been found anywhere except at the entrance of the Bay of Tôkyô at a depth of some 200 fathoms.

II.—THE PEOPLE.

Population.—The population was as follows on the 31st of December 1897:—

<table>
<thead>
<tr>
<th>Year</th>

</table>

According to quasi-historical records, the population of the empire in the year A.D. 610 was 4,988,842, and in 736 it had grown to 8,631,770. It is impossible to say how much reliance may be placed on these figures, but from the 18th century, when the name of every subject was to be written on a wall as a temple as a measure for his adoption of Christianity, a tolerably trustworthy census could always be taken. The returns thus obtained show that from the year 1723 until 1846 the population remained almost stationary, from 1846 to the first year being 26,055,422, and that in the latter year 26,907,625. There had, indeed, been during this period an increase in population in that interval of 124 years, namely, the periods 1738–1744, 1750–1762, 1773–1774, 1791–1792, and 1844–1846. But after 1846 the census showed a total of 33,116,926, the population grew steadily, its increment between 1872 and 1891 included, a period of 27 years, being 10,640,990. Such a rate of increase invests the question of subsistence with great importance. In former times the area of land under cultivation increased in a marked degree. Returns prepared at the beginning of the 10th century showed 21 million acres under crops, whereas the figure in 1834 was over 8 million acres. But the development of means of subsistence has been outstripped by the growth of population in recent years. Thus, during the period between 1899 and 1907 the population received an increment of 11-5%, whereas the food-producing area increased by only 4-4%. This discrepancy caused anxiety at one time, but large fields suitable for colonization have been opened in Sakhalin, Korea, Manchuria and Formosa, so that the problem of subsistence has ceased to be troublesome. The birth-rate, taking the average of the annual period ended 1907, is 4-05% of the population, and the death-rate is 2-70%. Males exceed females in the ratio of 0-5% approximately. But this rule does not hold after the age of 65, when 1,300 females only 83 males are found. The Japanese are of low stature as compared with the inhabitants of Western Europe: about 16% of the adult males are below 5 ft. But there are evidences of steady improvement in this respect. Thus, during the period of ten years between 1893 and 1902, it was found that the percentage of recruits of 5 ft. 5 in. and upward grew from 10-9 to 12-67, the rate of inductees having been remarkably increased, and the percentage of those under 5 ft. declined from 20-21 to 16-20.

Towns.—There are in Japan 23 towns having a population of over 50,000, and there are 76 having a population of over 20,000. The larger towns, their populations and the growth of the latter during the five-year period commencing with 1898 were as follows:—

<table>
<thead>
<tr>

</tbody>
</table>

The growth of Kure and Sasebo is attributable to the fact that they have become the sites of large ship-building yards, the property of the Mexican government.

The number of houses in Japan at the end of 1903, when the census was last taken, was 8,725,544, the average number of inmates in each house being thus 3-5.

Physical Characteristics.—The best authorities are agreed that the Japanese people do not differ physically from their Korean and Chinese neighbours as much as the inhabitants of northern Europe differ from those of southern Europe. It is true that the Japanese are shorter in stature than either the Chinese or the Koreans. Thus the average height of the Japanese male is only 5 ft. 3½ in., and that of the female 4 ft. 10 in., whereas in the case of the Koreans and the northern Chinese the corresponding figures for males are 5 ft. 5 in. and 5 ft. 7 in. respectively. Yet in other physical characteristics the Japanese, the Koreans...
and the Chinese resemble each other so closely that, under similar conditions as to costume and coiffure, no appreciable difference is noticed. Thus it has become the fashion for Chinese students to flock to the schools and colleges of Japan, there adopting, as do their Japanese fellow-students, Occidental garments and methods of hairdressing, the distinction of nationality ceases to be perceptible. The most exhaustive anthropological study of the Japanese has been made by Dr. E. Baclz (emeritus professor of medicine in the Imperial University of Tôkyô), who enumerates the following sub-divisions of the race inhabiting the Japanese islands. The first and most important is the Manchu-Korean type; that is to say, the type which prevails in north China and in Korea. This is seen especially among the upper classes in Japan. Its characteristics are exceptional tallness combined with slenderness and elegance of figure; a face somewhat long, with a small amount of prominence of the cheek-bones but having more or less oblique eyes; an aquiline nose; a slightly receding chin; large upper teeth; a long neck; a narrow chest; a long trunk, and delicately shaped, small hands with long, slender fingers. The most plausible hypothesis is that men of this type and descendants of Korean colonists who, in prehistoric times, settled in the province of Izumo, on the west coast of Japan, having made their way either from the Korean peninsula by the island of Oki, or by the cold current flowing along the eastern coast of Korea. The second type is the Mongol. It is not very frequently found in Japan, perhaps because, under favourable social conditions, it tends to pass into the Manchu-Korean type. Its representative has a broad face, with prominent cheek-bones, oblique eyes, a nose more or less flat and a wide mouth. The figure is strongly and squarely built, but this last characteristic can scarcely be called typical. There is no satisfactory theory as to the route by which the Mongols reached Japan, but it is scarcely possible to doubt that they found their way thither at one time. More important than either of these types as an element of the Japanese nation is the Malay. Small and slender, these short and dark-skinned people, whose hair is almost straight, black, and very fine, have black eyes, and their hair often grows to their shoulders. The Manchu-Koreans and the Malays, until only a mere handful of them survived in the northern island of Yezo. Like the Malay and the Mongol types they are short and thickly built, but unlike either they have prominent brows, bushy locks, round deep-set eyes, long divergent lashes, straight noses and much hair on the face and the body. In short, the Ainu suggest much closer affinity with Europeans than does any other of the types that go to make up the population of Japan. It is not to be supposed, however, that these traces of different elements indicate any lack of homogeneity in the Japanese race. Amalgamation has been completely effected in the course of long centuries, and even the Ainu, though the small surviving remnant of them now live apart, have left a trace upon their conquerors.

The typical Japanese of the present day has certain marked physical peculiarities. In the first place, the ratio of the height of his head to the length of his body is greater than it is in Europeans. The Englishman's head is often one-eighth of the length of his body or even less, and in continental Europeans, as a rule, the ratio does not amount to one-seventh; but in the Japanese it exceeds the latter figure. In all nations men of short stature have relatively large heads, but in the case of the Japanese there appears to be some racial reason for the phenomenon. Another striking feature is shortness of legs relatively to length of trunk. In northern Europeans the leg is usually much more than one-half of the body's length, but in Japanese the ratio is one-half or even less; so that whereas the Japanese, when seated, looks almost as tall as a European, there may be a great difference between their statures when both are standing. This special feature has been attributed to the Japanese habit of kneeling instead of sitting, but investigation shows that it is equally marked in the working classes who pass most of their time standing. In Europe the same physical traits—relative length of head and shortness of legs—distinguish the central race (Alpine) from the Teutonic, and seem to indicate an affinity between the former and the Mongols. It is in the face, however, that we find specially distinctive traits, namely, in the eyes, the eyelashes, the cheekbones and the beard. Not that the eyelash itself differs from that of an Occidental. The difference consists in the fact that the socket of the eye is comparatively small and shallow, and the osseous ridges at the brows being little marked, the eye is less deeply set than in the European. Again, in profile, forehead and upper lip often form an unbroken line.

In Japan, the open eye is almost invariably horizontal in the European, it is often oblique in the Japanese on account of the higher level of the upper corner. Even apart from obliqueness, the shape of the corners is peculiar in the Mongolian eye. The inner corner is partly or entirely covered by a fold of the upper lid continuing more or less into the lower lid. This fold often covers also the whole free rim of the upper lid, so that the insertion of the eyelashes is hidden and the opening between the lids is so narrowed as to disappear altogether at the moment of laughter. As for the pre-lid furrow, it is not only less pronounced, but is also more converging, so that whereas in a European the free ends of the lashes are further distant from each other than their roots, in a Japanese they are nearer together. Prominence of cheekbones is another special feature, but it is much more prominent in the lower than in the upper classes, where elongated faces may be almost said to be the rule. Finally, there is marked paucity of hair on the face of the average Japanese—apart from the Ainu—and what hair there is is nearly always straight. It is not to be supposed, however, that because the Japanese is short of stature and often finely moulded, he lacks either strength or endurance. On the contrary, he possesses both in a marked degree, and his deftness of finger is not less remarkable than the suppleness and activity of his body.

Moral Characteristics.—The most prominent trait of Japanese disposition is gaiety of heart. Emphatically of a laughing-nature, the Japanese passes through the world with a smile on his lips. The petty ills of life do not disturb his equanimity. He takes them as part of the day's work, and though he sometimes grumbles, rarely, if ever, does he repine. Exceptional to this general rule, however, is a mood of pessimism which sometimes overtakes youths on the threshold of manhood. Finding the problem of life insolvable, they abandon the attempt to solve it and take refuge in the grave. It seems as though there were always a number of young men hovering on the brink of such suicidal despair. An example alone is needed finally to destroy the equilibrium. Some one throws himself over a cataract or leaps into the crater of a volcano, and immediately a score or two follow. Apparently the more picturesquely awful the manner of the demise, the greater its attractive force. The thing is not a product of insanity, as the term is usually interpreted; letters always left behind by the victims prove them to have been in full possession of their reasoning faculties up to the last moment. Some observers lay the blame at the door of Buddhism, a creed which promotes pessimism by besetting the anchorite, the ascetic and the shuddering believer in seven hells. But Buddhism did not formerly produce such
incidents, and, for the rest, the faith of Shaka has little sway over the student mind in Japan. The phenomenon is modern: it is not an outcome of Japanese nature nor yet of Buddhist teaching, but is due to the stress of endeavouring to reach the standards of Western acquirement with grievously inadequate equipment, opportunities and resources. In order to support himself and pay his academic fees many a Japanese has to fall into the ranks of the physical labourer during a part of each day or night. Ill-nourished, over-worked and, it may be, disappointed, he finds the struggle intolerable and so passes out into the darkness. But he is not a normal type. The normal type is light-hearted and buoyant. One naturally expects to find, and one does find, that this moral sunshine is associated with good temper. The Japanese is exceptionally serene. Irascibility is regarded as permissible in sickly children only: grown people are supposed to be superior to displays of impatience. But there is a limit of imperturbability, and when that limit is reached, the subsequent passion is desperately vehement. It has been said that these traits go to make the Japanese soldier what he is. The hardships of a campaign cause him little sufferings—immensities to any civilized man. He never seems to realize that he is comforting himself with the thought that he is getting on. He is too great to be forgotten of anything save victory. In the case of the military class—and prior to the Restoration of 1867 the term “military class” was synonymous with “educated class”—this spirit of stoicism was built up by precept on a solid basis of heredity. The samurai (soldier) learned that his first characteristic must be to suppress all outward displays of emotion. Pain, pleasure, passion and peril must all find him unperturbed. The supreme test, satisfied so frequently as to be commonplace, was a shocking form of suicide performed with a placid mien. This capacity, coupled with readiness to sacrifice life at any moment on the altar of country, fief or honour, made a remarkably heroic character. On the other hand, some observers hold that the education of this stoicism was effected at the cost of the feelings it sought to conceal. In support of that theory it is pointed out that the average Japanese, man or woman, will recount a death or some other calamity in his own family with a perfectly calm, if not a smiling, face. Probably there is a measure of truth in the criticism. Feelings cannot be habitually hidden without being more or less blunted. But here another Japanese trait presents itself—politeness. There is no more polite nation in the world than the Japanese. Whether in real courtesy of heart they excel Occidentals may be open to doubt, but in all the forms of comity they are unrivalled. Now one of the cardinal rules of politeness is to avoid burdening a stranger with the weight of one’s own woes. Therefore a mother, passing from the chamber which has just witnessed her paroxysms of grief, will describe calmly to a stranger—especially a foreigner—the death of her only child. The same suppression of emotional display in public is observed in all the affairs of life. Youths and maidens maintain towards each other a demeanour of reserve and even indifference, from which it has been confidently affirmed that love does not exist in Japan. The truth is that in no other country do so many dual suicides occur—suicides of a man and woman who, unable to be united in this world, go to a union beyond the grave. It is true, nevertheless, that love as a prelude to marriage finds only a small place in Japanese ethics. Marriages in the great majority of cases are arranged with little reference to the feelings of the parties concerned. It might be supposed that conjugal fidelity must suffer from such a custom. It does suffer seriously in the case of the husband, but emphatically not in the case of the wife. Even though she be cognisant—as she often is—of her husband’s extra-marital relations, she abates nothing of the duty which she has been taught to regard as the first canon of female ethics. From many points of view, indeed, there is no more beautiful type of character than that of the Japanese woman. She is entirely unsensual; exquisitely modest without being anything of a prude; abounding in intelligence which is never obscured by egotism; patient in the hour of suffering; strong in time of affliction; a faithful wife; a loving mother; a good daughter; and capable, as history shows, of heroism rivalling that of the stronger sex. As to the question of sexual virtue and morality in Japan, grounds for a conclusive verdict are hard to find. In the interests of hygiene prostitution is licensed, and that fact is by many critics construed as proof of tolerance. But licensing is associated with strict segregation, and it results that the great cities are conspicuously free from evidences of vice, and that the streets may be traversed by women at all hours of the day and night with perfect impunity and without fear of encountering offensive spectacles. The ratio of marriages is approximately 8.46 per thousand units of the population, and the ratio of divorces is 1.36 per thousand. There are thus about 16 divorces for every hundred marriages. Divorces take place chiefly among the lower orders, who frequently treat marriage merely as a test of a couple’s suitability to be helpmates in the struggles of life. If experience develops incompatibility of temper or some other mutually repellent characteristic, separation follows as a matter of course. On the other hand, divorces among persons of the upper classes are comparatively rare, and divorces on account of a wife’s unfaithfulness are almost unknown.

Concerning the virtues of truth and probity, extremely conflicting opinions have been expressed. The Japanese samurai is himself occasionally described as “no second hand.” He never drew his sword without using it; he never gave his word without keeping it. Yet it may be doubted whether the value attached in Japan to the abstract quality, truth, is as high as the value attached to it in England, or whether the consciousness of having told a falsehood weighs as heavily on the heart. Much depends upon the motive. Whatever may be said of the upper class, it is probably true that the average Japanese will not sacrifice expediency on the altar of truth. He will be varacious only so long as the consequences are not seriously injurious. Perhaps no more can be affirmed of any nation. The “white lie” of the Anglo-Saxon and the hōben no uso of the Japanese are twins. In the matter of probity, however, it is possible to speak with more assurance. There is undoubtedly in the lower ranks of Japanese tradesmen a comparatively large fringe of persons whose standard of commercial morality is defective. They are descendants of feudal times when the mercantile element, being counted as the dregs of the population, lost its self-respect. Against this blashem—which is in process of correction—the fact has to be set that the better class of merchants, the whole of the artisans and the labouing classes in general, obey canons of probity fully on a level with the best to be found elsewhere. For the rest, frugality, industry and patience characterize all the bread-winners; courage and burning patriotism are attributes of the whole nation.

There are five qualities possessed by the Japanese in a marked degree. The first is frugality. From time immemorial the great mass of the people have lived in absolute ignorance of luxury in any form and in the perpetual presence of a necessity to economize. Amid these circumstances there has emerged capacity to make a little go a long way and to be content with the most meagre fare. The second quality is endurance. It is born of causes cognate with those which have begotten frugality. The average Japanese may be said to live without artificial heat; his paper doors admit the light but do not exclude the cold. His brazier barely suffices to warm his hands and his face. Equally is he a stranger to methods of artificial cooling. He takes the frost that winter inflict and the fever that summer brings as unavoidable. The third quality is obedience; the offspring of eight centuries passed under the shadow of military autocracy. Whatever he is authoritatively bidden to do, that the Japanese will do. The fourth quality is altruism. In the upper classes the welfare of the family has been set above the interests of each member. The fifth quality is a genius for detail. Probably this is the outcome of an extraordinarily elaborate system of social etiquette. Each generation has added something to the canons of its predecessor, and for every ten points preserved not more than one has been discarded. An instinctive respect for minutiae has thus been inculcated, and has gradually extended to all the affairs of life. That this accuracy may sometimes degenerate into triviality, and that such absorption in trifles may occasionally hide the broad horizon, is conceivable.
As to which of the first two methods of pronunciation had chronological precedence, the weight of opinion is that the kan came later than the go. Evidently this trilocalization of sounds had many disadvantages, but, on the other hand, the whole Chinese language may be said to have been in transition. Chinese has the widest capacity of any tongue ever invented. It consists of thousands of monosyllabic roots, each having a definite meaning. These monosyllables may be used singly or combined, two, three or four in number, so that the combinations convey almost any conceivable shades of meaning. Take, for example, the word 'electricity.' The very idea conveyed was wholly novel in Japan. But scholars were immediately able to construct the following:

Lightning. 
Dem.  Denki. 
Electricity.  Denki.  HS = tides. 
Telegraph.  Dempō.  To = lamp. 
Positive electricity.  Yodenki.  Yo = the positive principle. 
Telephone.  Denwa.  Wa = conversation.

Every branch of learning can thus be equipped with a vocabulary. Patent, however, as such a vehicle is for expressing thought, its ideographic script constitutes a great obstacle to general acquisition, and the Japanese soon applied themselves to minimizing the difficulty by substituting a phonetic system. Analysis showed that all the sounds in the language could be divided into two groups, having selected the ideographs that corresponded to these sounds, they reduced them, first, to six, then to six, and, secondly, to still more simplified forms called katakana.

In brief, then, is the story of the development of writing in Japan. When we come to dissect it, we find several striking characteristics. First, the construction is unlike that of any European tongue: all qualifiers precede the words they qualify, except prepositions which become expressions. Thus instead of saying 'the house of Mr. Smith is in that street,' a Japanese says 'Smith Mr of house that street in is.' There is no relative pronoun, and the resulting complication seems great to an English-speaking person, as the following illustration will show:

JAPANESE. 
Zenaku wo saiban suru tame no 
Virtue vice-judging sake of 
mochitaru yūsō no hojun wo 
used unique standard which 
ji no kotō tada 
benevolence of conduct only 
kore no ni. 
mei no.

The unique standard which is used for judging virtue or vice is benevolent conduct solely.

It will be observed that in the above sentence there are two untranslatable words, wo and wa. These belong to a group of forty auxiliary particles called te ni wa ha (or wo), which serve to mark the cases of nouns, te (or de) being the sign of the instrumental ablative; ni that of the dative; wo that of the objective, and wa that of the nominative. Of the two, te and ni have been borrowed from Chinese, the latter also, and the characters corresponding to them have not been used in any other tongue. There are also polite and ordinary forms of expression, often so different as to constitute distinct languages; and there are a number of honorifics which frequently discharge the duty of pronouns. Another marked peculiarity is that active agency is never attributed to neuter nouns. A Japanese does not say "the poison killed him" but "he died on account of the poison;" nor does he say "the war has caused commodities to appreciate," but "commodities have appreciated in consequence of the war." That the language loses much force owing to this limitation cannot be denied: metaphor and allegory are almost completely banished.

The difficulties that confront an Occidental who attempts to learn Japanese are enormous: a person must, in the first place, become acquainted with the Chinese ideographs. For example, the ideographs signifying rice or metal or water in Chinese were used to convey the same ideas in Japanese. Each ideograph thus came to have two sounds, one Japanese, the other Chinese—a e.g. the ideograph shi, "the sky," signifying heaven in Chinese and "the sun" in Japanese, nor was this the whole story. There were two epochs in Japan's study of the Chinese language: first, the epoch when she received Confucianism through Korea; and, secondly, the epoch when she began to study Buddhism directly from China. For examples of ideographs that came by Korea were corrupt, or whether the interval separating these epochs had sufficed to produce a sensible difference of pronunciation in China itself, it would seem that the students of Buddhism who went from Korea to the Middle Kingdom could not have been sure (A.D. 589-619) insisted on the accuracy of the pronunciation acquired there, although it diverged perceptibly from the pronunciation already recognized in Japan. Thus, in fine, each word came to have two Chinese, one as this and the go, and one Japanese, known as the kun. For example:

<table>
<thead>
<tr>
<th>KAN</th>
<th>&quot;GO&quot;</th>
<th>JAPANESE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nem</td>
<td>Zen</td>
<td>Toshi</td>
</tr>
<tr>
<td>Jinkan</td>
<td>Ningen</td>
<td>Uta no aida</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Human being.</td>
</tr>
</tbody>
</table>

In view of this there is a strong movement in favour of romanizing the Japanese script: that is to say, abolishing the ideograph and adopting in its place the Roman alphabet. But while everyone appreciates the magnitude of the relief that would thereby be afforded, it is not yet certain that the progress is not blocked.

A language which has been adapted from its infancy to ideographic transmission cannot easily be fitted to phonetic uses.

and its consequent accessibility, there arose a galaxy of scholars under whose influence the archaic style and the ancient Japanese traditions entered a period of renaissance. The story of this period and of its products has been admirably told by Sir Ernest Satow ("Revival of Pure Shinto," Proceedings of the Asiatic Society of Japan, vol. iii.), whose essay, together with Professor Chamberlain's Kojiki, the same author's introduction to The Classical Poetry of the Japanese, and Mr. W. G. Aston's Nihongi, are essential to every student of Japanese literature. To understand this 17th century renaissance, knowledge of one fact is necessary, namely, that about the year a.d. 810, a celebrated Buddhist priest, Kūkai, who had spent several years studying in China, compounded out of Buddhism, Confucianism and Shinto a system of doctrine called Ryōbu Shinto (Dual Shinto), the prominent tenet of which was that the Shintō deities were merely transmigrations of Buddhist divinities. By this device Japanese conservatism was effectively conciliated, and Buddhism became in fact the creed of the nation, its positive and practical precepts entirely eclipsing the agonistic intuitionalism of Shintō. Against this hybrid faith several Japanese scholars arrayed themselves in the 17th and 18th centuries, the greatest of them being Mabuchi and Motoori. The latter's magnum opus, Kojikiden (Exposition of the Record of Ancient Matters), declared by Chamberlain to be "perhaps the most admirable work of which Japanese erudition can boast," consists of 44 large volumes, devoted to elucidating the Kojiki and resuscitating the Shintō cult as it existed in the earliest days. This great work of reconstruction was only one feature of the literary activity which marked the 17th and 18th centuries, when, under Tokugawa rule, the blessing of long-unknown peace came to the nation. Ieyasu himself devoted the last years of his life to collecting ancient manuscripts. In his country retreat at Shizuoka he formed one of the richest libraries ever brought together in Japan, and by will he bequeathed the Japanese section of it to his eighth son. When, however, the latter was no more, the Prince of Ikkō, the successor to his tenth son, the prince of Kishū, with the result that under the former feudatory's auspices two works of considerable merit were produced treating of ancient ceremonies and supplementing the Nihongi. Much more memorable, however, was a library formed by Ieyasu's grandson the feudal chief of Mito (1662–1700), who not only collected a vast quantity of books hitherto scattered among Shintō and Buddhist monasteries and private houses, but also employed a number of scholars to compile a history unprecedented in magnitude, the Dai-Nihon-shi. It consisted of 240 volumes, and it became at once the standard in its own branch of literature. Still more comprehensive was a book emanating from the same source and treating of court ceremonies. It ran to more than 500 volumes, and the emperor honoured the work by bestowing on it the title Reiō Shū Tenn (Rules of Ceremonials). These compilations together with the Nihon Gwatsū (History of Japan Outside the Court), written by Kai Sanyo and published in 1827, constituted the chief sources of historical knowledge before the Meiji era. Kai Sanyo devoted twenty years to the preparation of his 22 volumes and took his materials from 259 Japanese and Chinese works. But neither he nor his predecessors recognized in history anything more than a vehicle for recording the mere sequence of events and their relations, together with some account of the personages concerned. Their volumes make profoundly dry reading. Vicarious interest, however, attaches to the productions of the Mito School on account of the political influence they exercised in rehabilitating the nation's respect for the throne by unveiling the picture of an epoch prior to the usurpations of military feudalism. The struggles of the great rival clans, replete with episodes of the most tragic and stirring character, inspired quasi-historical narrations of a more popular character, which often took the form of illuminated scrolls. But it was not until the Meiji era that history, in the modern sense of the term, began to be written. During recent times many students have turned their attention to this branch of literature. Works of wide scope and clear insight have been produced, and the Historiographers' section in the Imperial University of Tōkyō
JAPAN

has been for several years, engaged in collecting and publishing materials for a history which will probably rank with anything of the kind in existence.

In their poetry above everything the Japanese have remained impervious to foreign influences. It owes this conservatism of its prosody. Without rhyme, without variety of metre, without elasticity of dimensions, it is also without known counterpart. To alter it in any way would be to deprive it of all distinctive character. It would lose the distinctive character of a national order of songs seems to have discovered that a peculiar and very fascinating rhythm is produced by lines containing 5 syllables and 7 syllables alternately. That is Japanese poetry (uta or tanka). There are generally five lines: the first and third consisting of 5 syllables, the second, fourth, and fifth of 7 syllables, making a total of 31 in all. The number of lines is not compulsory: sometimes they may reach to thirty, forty or even more, but the alternation of 5 and 7 syllables is compulsory. The most attested form of all is the onya (of the form consisting of the thought. The 17 syllables. Necessarily the ideas embodied in such a narrow vehicle must be fragmentary. Thus it results that Japanese poems are, for the most part, impressionist; they suggest a great deal more than they actually express. Here is an example:

Momiji ha wo
Kaze ni makasete
Miyabi ni
Hakana nano wa
Inochi nari keri

More fleeting than the glint
Of withered leaf, wind-blow'd, the thing called life.

There is no English metre with this peculiar cadence.

It is not to be inferred that the writers of Japan, enamoured as they were of Chinese ideographs and Chinese style, deliberately excluded everything Chinese from the realm of poetry. On the contrary, such words were admitted and which showed something of the "parallelism" peculiar to Chinese poetry, since the first ideograph of the last line was required to be identical with the final ideograph. But this rule, whether written and preserved, the alternation of 5 and 7 being, however, dispensed with. Such Couplets were called shi to distinguish them from the pure Japanese uta or tanka. The two greatest masters of Japanese poetry were Hitomaro and Akiko. The first was born in 907, the other in 997, and both died in 1055. Tosa Tairakute, who flourished at the beginning of the 10th century, and is not supposed to have transmitted his mantle to any successor. The choicest productions of the former two with those of many other poets were brought together in 1756 and embodied in thevolume Anthologie (Collection of a Mere Lender). The volume remained unique until the beginning of the 19th century, when the volume 905 Tsurayuki and three coadjutors composed the Kokushi (Collection of Odes Ancient and Modern), the first of twenty-one similar acento, and it may well be doubted whether the Japanese language can be adapted to such uses.

It was under the auspices of an empress (Suiko) that the first historical manuscript is said to have been compiled in 620. It was written in Chinese characters and is called the Nihon shoki. In the 11th century, the composition of the uta gradually deteriorated from the end of the 9th century; the when a game uta-awase became a fashionable pastime, and aristocratic men and women tried to string together verses of 31 syllables, connected by the form consisting of the thought. The uta, in its later developments, may not unjustly be compared to the Occidental game of bouts-rimés. The poetry of the nation remained immovable in the ancient grove until very modern times, when, either by direct access to the originals or through the medium of various translations, the nation became acquainted with the masters of Occidental song. A small coterie of authors, headed by Professor Toyama, then attempted to revolutionize Japanese poetry by recasting it on European lines. But the project failed elegantly, and it may be supposed whether the Japanese language can be adapted to such uses.

Influence

The Record of Ancient Matters was transcribed (712) from the

women, tips of a court lady. And it was under the auspices of an

of Ancient Literature.

in the feminine language, the classical, or Chinese, form being adapted to men. The distinction continued throughout the ages. To this day the reappeared in Japan in the form of Japanese in the infancy of Japanese literature. It is easy to understand the connexion between them and the Nō. Very soon the Nō came to occupy in the estimation of the military class a position similar to that held by the tanka as a literary pursuit, and its dramatic composition. The artistic aims not only patronized the Nō but were themselves ready to take part in it. Costumes of the utmost magnificence were worn, and the chiselling of masks for the use of the performers occupied scores of skilled artists. The few classical dramas of this kind in a compendium called the Yōyōka Tōge, and many of them are inseparably connected with the names of Kawanai Kyōsai (1406) and his son Motokō (1453), who are counted the fathers of the art. For a moment, when the tide of Western civilization swept over Japan, the Nō seemed likely to be permanently submerged. But the renaissance of nationalism (hokusai hosen) saved the venerable drama, and owing to the exertions of Prince Ikukawa, the artist Hôshô Kuro and Umewarō Minor, it stands as high as ever in popular favour.

Concerning the
five schools into which the Nō is divided, their characteristics and their differences—these are matters of interest to the initiated alone. The Japanese are essentially a laughter-loving people. They are highly susceptible of tragic emotions, but they turn gladly to the lighter phases of life. Hence a need was steadily felt of something to dispel the pessimism of the Nō, and that something took the form of comedies played in the interludes of the Nō and called Kyōgen (mad words). The Kyōgen needs no elaborate description. It is the declamatory, melodramatic, or histrionic, Aristocratic Nō and the Kyōgen. The Jōruri and the Kabuki. They were born at the close of the 16th century and they owed their origin to the growing influence of the commercial class, who asserted a right to a more lighthearted and less aristocratic Nō and the Kyōgen. The Jōruri is a dramatic ballad, sung or recited to the accompaniment of the samisen and in unison with the movements of puppets. It came into existence in Kioto and was usually sung to two melodies: the first, a slow Japanese playwright, Chikamatsu Monzaemon (1653-1724), and a musician of exceptional talent, Takemoto Gidayū, collaborated to render this puppet drama a highly popular entertainment. It flourished for nearly 200 years in Yedo, and is still occasionally performed in Osaka. Like the Nō the Jōruri dealt always with sombre themes, and was followed by the Kabuki (farce). This last owed its inception to a priestess who, having abandoned her religious vocation, took up the art of the Nō as means of livelihood and trained a number of girls for the purpose. The law presently interdicted these female comedians (onna-ka-buki) in the interests of public morality, and they were succeeded by "boy comedians" (ojō-buki) who simulated the girls and were dressed in their turn, in civil or in lilliputian kabuki (comedians with queues). Gradually the Kabuki developed the features of a genuine theatre; the actor and the playwright were discerned, and the performances taking the form of domestic drama (Wagoto and Kabuki). The occupation of the Kabuki is essentially one of perpetual fame sprung up, as Sakata Tōjirō and Ichikawa Danjirō (1660-1704). Mimetic posture-dances (Shosagoto) were always introduced as interludes; past and present indiscriminately contended with highest dramatic achievement. The actor's expression was so intense that it was incomparably heightened by the extreme of histrionic talent of the very highest order was often displayed. But the Kabuki-za and its yakusaka (actors) always remained a plebeian institution. No samurai frequented the former or associated with its followers. Introduction of the kabuki to the civilisation in modern times, however, the theatre ceased to be tabooed by the aristocracy. Men and women of all ranks began to visit it; the emperor himself consented (1887) to witness a performance by the great stars of the stage at the private residence of Marquess Inoue. The Kabuki is not the only reminder of the influence of prominent noblemen and scholars; drastic artistic efforts were made to purge the old historical dramas of anachronisms and inconsistencies, and at length a theatre (the Yuraku-za) was built on purely European lines, with a stage rising over the spectators, and one long-drawn-out drama with interludes of whole farces, a visitor may devote only a few evening-hours to the pastime. The Shosagoto has not been abolished, nor is there any reason why it should be. It has, however, given his countrymen to the philosophy of Chu-Hi; the kyangaku of that time. For their day and country they were emphatically the salt of earth." But naturally not all were believers in the same philosophy. The fervour of the followers of Chu-Hi (the orthodox school) could not fail to provoke opposition. Thus was the idea of a devoted idealism, essayed by the Nō of Wang Yang-ming, and others advocated direct study of the works of Confucius and Mencius. Connected with this rejection of Chu-Hi were such eminent names as those of Ito Junsai (1672-1718), Brother Daisen (1659-1735), and Brother Kunsai (1679-1747). These Chinese scholars made a substitute of the present aversion for Buddhism, and in their turn they were held in abeyance by the Buddhists and the Japanese scholars (cagakuscha), so that the second half of the 18th century was a time of perpetual wrangling among the adherents of the two religions. By the end of the period, at any rate, Buddhist and Confucianism had by no means lost their hold. But the sent of Buddhist was in a state of reaction from the minds of the people, and, to be sure, there were Buddhists who were weary of the old ideas of Buddhism and were willing to accept a rationalist creed in its place. In the end, however, the influence of the Confucianism was predominant and the Buddhist went into the underground as a reaction to the strictures of Confucianism. The实惠 of the latter was that it was not essential to Buddhism, and it was not essential to the Confucianism to be on the side of the people. The实惠 of the latter was that it was not essential to Buddhism, and it was not essential to the Confucianism to be on the side of the people.
Newspapers:

Japan

Setchūhā (Plum blossoms in snow) and Kwakten-ō (Nightingale among Flowers) by Suyehiro. This idea of subserving literature to political ends is said to have been suggested by Nakaie Tokusuke’s translation of Rousseau’s Contrat social. The year 1882 saw Julius Caesar in a Japanese dress. The translator was Tsubouchi Shōyō, one of the greatest writers of the Meiji era. His Shōsetsu Shinshū (Essentials of a Novel) was an eloquent plea for realism as contrasted with the artificiality of the characters depicted by Bakin, and his own works were greatly admired. In the same year, later in the same year, the Tsubouchi Shōyō also published the first literary periodical published in Japan, namely, the Waseda Bungaku, so called because Tsubouchi was professor of literature in the Waseda University, an institution founded by Count Okuma, whose name cannot be omitted from any history of Meiji literature. Tsubouchi also wrote in favor of the rapid development of familiarity with foreign authors, a Japanese retrospect of the Meiji era notes that whereas Macaulay’s Essays were in the curriculum of the Imperial University in 1851–1852, they were dropped from the syllabus a few years later as students of the latter were able to read with understanding the works of Goldsmith, Tennyson and Thackeray. Up to Tsubouchi’s time the Meiji literature was all in the literary language, but there was then formulated a demand calling itself Kenkōsō, some of whose associations, as Bimyōsai—used the colloquial language in their works, while others—as Kōyō, Rōhan, &c.—went back to the classical diction of the Genromo era (1653–1705). Rōhan is one of the most renowned of Japanese authors. At the same time, the newspaper, which had been hitherto a mere vehicle for news, began to assume the role of a periodical. Henceforward, newspapers began to appear in increasing numbers. Novels—such as Dickens, Thackeray, Turguéniev, may be cited—as Gunki, Tōshi and Makichi—in short, every literary magnate of the Occident has found one or more interpreters in Japan. Accurate reviewers of the era have divided it into periods of two or three years each, according to the varying output of Japanese periodicals that have every year seen a large addition to the number of Japanese who study the masterpieces of Western literature in the original.

Newspapers, as the term is understood in the West, did not exist in old Japan. The term is used here, and Tsubouchi defines as newspapers the publications that submit to the government of Nagasaki selected extracts from newspapers arriving from Batavia, and these extracts, having been translated into Japanese, were forwarded to the court in Yedo (now Tokyo) by order of the then government. Onoda fuseshū (Dutch Reports) was given. Immediately after the conclusion of the first treaty in 1857, the Yedo authorities instructed the office for studying foreign books (Bunsho torishirabē) to translate those books into Japanese, and attempts were made to translate both minor works and works of acknowledged renown. Occasionally these translations were copied for circulation among officials, but the bulk of the people knew nothing of them. Thus the first real newspaper did not see the light until 1861, when a Yedo publisher brought out the Batusi News, a compilation of items from the Batavia news, and his compatriots did as well, and the government permitted him to continue his periodical. The Yonmari Shimbun (Buy and Read News) was the first to break away from this pernicious fashion. Established in 1875, it adopted a style midway between the defence of free institutions and that of the middle classes and to the entire female population. The Yonmari Shimbun (Pictorial Newspaper), the first to illustrate publications and to publish feuilleton romances. Both of these journals were accompanied by the great majority of the newspapers and periodicals ranged themselves under the flag of this or that party. An era of embittered polemics ensued. The journals, while fighting continuously against each other, were at the same time established as authorities for itself and the other. Few readers turned away in disgust, and journal after journal passed out of existence. The situation was saved by a newspaper which from the outset of its career obeyed the best canons of journalism. This was the Yonmari Shimbun, which having its advantage of having its policy controlled by one of the greatest thinkers of modern Japan, Fukuzawa Yukichi. Its basic principle was liberty of the individual, liberty of the family and liberty of the nation. It was distributed without charge on the side of broad-minded, just and liberal opinions. It derived its materials from foreign and domestic sources. Other newspapers of greatly improved character followed the Yonmari Shimbun, especially notable among them being the Kokumin Shimbun. In the meanwhile Osaka, always pioneer in matters of commercial enterprise, had set the example of applying the force of capital to journalistic development. Tokyō journals were all on a literary or political basis, but the Osaka Asahi Commercial Shimbun (Osaka Rising Sun News) was purely a financial venture, and the newspaper industry made no exception. Ryūhei, spared no expense to obtain news from all quarters of the
world, and for the first time the Japanese public learned what stores of information may be found in the columns of a really enterprise
journal. Very soon the Asahi had a keen competitor in the Osaka
Mainichi, Osaka Daily News, and these papers ultimately
broke all rivals in Osaka. In 1888 Matsumura established the
Asahi in Tokyo, and thither he was quickly followed by his Osaka
rival, which in Tokyo took the name of Mainichi Dempo (Daily
Times). These two newspapers now stand alone as purveyors
of copious telegraphic news, and in the next rank, not greatly lower,
comes the Yomi Shimpo.

With the opening of the diet in 1890, politics again obtruded
itself into newspaper columns, but as practical living issues
now occupied the public mind, the political exaltation of earlier
years was at length secured. Already (1887) the government had
voluntarily made a great step in advance by divesting itself of the right
to intrude in matters which were not of its concern. But it reserved
the power of suppressing or suspending a newspaper, and this was
a reservation a majority of the lower house voted, session after session,
only to see the bill rejected by the peers, who shared the govern-
ment’s opinion that to grant a larger measure of liberty would
certainly encourage licentiousness until 1897 was this opposition
fully overcome. A new law, passed by both houses and confirmed
by the emperor, took from the executive all power over journals,
except in cases of as he majesty, and nothing now remains of the
former arbitrary system except that any periodical having a political
complexion is required to deposit security varying from 175 to 350
yen. The result has falsified all sinister forebodings. A much more
modern tone pervades the writings of the press since restrictions
were entirely removed, and in 1887-1897 there were published 775 journals
and periodicals published throughout the empire, with an annual
circulation of some 700 million copies, full of language,
such as in former times would have provoked official interference,
but practically none. In the case of Chinese periodicals editors have
captured with remarkable alacrity the spirit of modern Japan.
But a few years ago they used to compile laborious essays, in which
the inspiration was drawn from Occidental text-books, and the alien
character of the source was hidden under a veneer of Chinese
aphorisms. To-day they write terse, succinct, closely pressed, one-
paragraph articles, seldom diffuse, often witty; and generally free from extra-
gavation of thought or diction. Incidentally they are hastening
the destruction of the monotype, and the spoken languages (genbun
itchi) which may possibly precede it, still giving a greater satisfaction
of the ideographic script. Yet, with few exceptions, the profession
of journalism is not remunerative. Very low rates of subscription,
and a small profit, or even charges for advertising, are chiefly to blame.

The vicissitudes of the enterprise may be gathered from the fact
that, whereas 2767 journals and periodicals were started between
1889 and 1894 (inclusive), no less than 2465 ceased publishing.
The largest circulation recorded in 1908 was about 150,000 copies daily,
and the home of origin of that exceptional figure belonged to the
Osaka Asahi Shimbum.

IV.—JAPAN ART

Painting and Engraving.—In Japanese art the impressionist
element is predominant. Pictures, as the term is understood
in Europe, can scarcely be said to have existed at
any time in Japan. The artist did not depict emotion: he depicted the subjects that produced emotion. Therefore he took his motives from nature rather
than from history; or, if he borrowed from the latter, what
he selected was a scene, not the pains or the passions of its
actors. Moreover, he never exhausted his subject, but was always careful to leave a wide margin for the imagination of the spectator.
This latter consideration sometimes impelled him to
represent things which, to European eyes, seem trivial or insigni-
ficant, but which really convey hints of deep significance. In
short, Japanese pictures are like Japanese poetry: they do not
supply thought but only awaken it. Often their methods show
conventionalism, but it is conventionalism so perfect and free
in its elements that nature seems to suggest both the motive
and the treatment. Thus though neither botanically nor orni-
tologically correct their flowers and their birds show a truth
to nature, and a habit of minute observation in the artist, which
cannot be too much admired. Every blade of grass, every leaf
and feather, has been the object of loving and patient study.
It has been rashly assumed by some writers that the Japanese
do not study from nature. All their work is an emphatic pro-
test against this supposition. It can in fact be shown conclusively
that the Japanese have derived all their fundamental
ideas of symmetry, so different from ours, from a close study of
nature and her processes in the attainment of endless variety.
A special feature of their art is that, while often closely and
minutely imitating natural objects, such as birds, flowers and
flowers, the especial objects of their predilection and study, they
frequently combine the facts of external nature with a conven-
tional mode of treatment better suited to their purpose. During
the long apprenticeship that educated Japaneseerve to acquire
the power of writing with the brush the complication of charac-
ters borrowed from Chinese, they unconsciously cultivate the
habit of minute observation and the power of accurate
imitation, and with these the delicacy of touch and freedom of
hand which only long practice can give. A hair’s-breadth devia-
tion in a line is fatal to good calligraphy, both among the Chinese
and the Japanese. When they come to use the pencil in drawing,
they already possess accuracy of eye and free command of the
brush. Whether a Japanese art-worker sets himself to copy
what he sees before him or to give play to his fancy in combining
what he has seen with some ideal in his mind, the result shows
perfect facility of execution and easy grace in all the lines.

The beauties of the human form never appealed to the
Japanese artist. Associating the nude solely with the performance
of menial tasks, he deemed it worse than a solem to transfer
his attention to it in its present form, and thus a wide field of motive
was closed to him. On the other hand, the draped figure received
admirable treatment in his brush, and the naturalistic skill
of the 17th, 18th and 19th centuries reached a high level of skill
in depicting men, women and children in motion. Nor has there
ever been a Japanese Landseer. Sosen’s monkeys and badgers
constitute the one possible exception, but the birds, oxen, deer,
tigers, dogs, bears, foxes and even cats of the best Japanese
artists were ill drawn and badly modelled. In the field of
landscape the Japanese painter fully reached the eminence on which
his great Chinese masters stood. He did not obey the laws of
linear perspective as they are formulated in the Occident, nor
did he show cast shadows, but his aerial perspective and his
foreshortening left nothing to be desired. It has been suggested
that he deliberately eschewed chiaroscuro because his pictures,
destined invariably to hang in an alcove, were required to be
equally effective from every aspect and had also to form part of a
decorative scheme. But the more credible explanation is that
he merely followed Chinese example in this matter, as he did also in
linear perspective, accepting without question the curiously
curving lines which form the spine of this new art.

It is in the realm of decorative art that the world has chiefly
benefited by intercourse with Japan. Her influence is second only
to that of Greece. Most Japanese decorative designs consist of
natural objects, treated sometimes in a more
or less conventional manner, but always distinguished
by delicacy of touch, graceful freedom of conception and delight-
fully harmonized tints. Perhaps the admiration which the
Japanese artist has won in this field is due not more to his wealth
of fancy and skilful adaptation of natural forms, than to his
individuality of character in treating his subjects. There is
complete absence of uniformity and monotony. Repetition
without any variation is abhorrent to every Japanese. He
will not tolerate the stagnation and tedium of a dull uniformity
by mechanical reproduction. His temperament will not let him
endure the labour of always producing the same pattern. Hence
the repetition of two articles exactly like each other, and,
generally, the division of any space into equal parts are
instinctively avoided, as nature avoids the production of any
two plants, or even any two leaves of the same tree, which in
all points shall be exactly alike.

The application of this principle in the same free spirit is the secret of much of the originality and the excellence of the decorative
art of Japan. Her artists and artisans alike aim at symmetry, not by an equal division of parts, as we do, but rather by a cer-
tain balance of corresponding parts each different from the
other, and not numerically even, with an effect of variety and
freedom from formality. They seek it, in fact, as nature attains
the same end. If we take for instance the skins of animals that

text is incomplete, it is likely to contain a significant amount of information. The text is about Japanese art, specifically painting and engraving. It discusses the distinct nature of Japanese art, which is largely based on naturalistic observation and the ability to depict emotion. The text also touches on the differences between Japanese and Chinese approaches to art, particularly in landscape and decorative art. The text notes the influence of Japanese art on European art, particularly in the realm of decorative art.

are striped or spotted, we have the best possible illustration of nature's methods in this direction. Examining the tiger or the leopard, in all the beauty of their symmetrical adornment, we do not see in any one example an exact repetition of the same stripes or spots on each side of the mesial line. They seem to be alike, and yet are all different. The line of division along the spine, it will be observed, is not perfectly continuous or defined, but in part suggested; and each radiating stripe on either side is full of variety in size, direction, and to some extent in colour and depth of shade. Thus nature works, and so, following in her footsteps, works the Japanese artist. The same law prevailing in all nature's creation, in the plumage of birds, the painting of butterflies' wings, the marking of shells, and in all the infinite variety and beauty of the floral kingdom, the lesson is constantly renewed to the observant eye. Among flowers the orchids, with all their fantastic extravagance and mimick imitations of birds and insects, are especially prolific in examples of symmetrical effects without any repetition of similar parts or divisions into even numbers.

The orchids may be taken as offering fair types of the Japanese artist's ideal in all art work. And thus, close student of nature's processes, methods, and effects as the Japanese artist workman is, he ever seeks to produce humble replicas from his only art master. Thus he proceeds in all his decorative work, avoiding studiously the exact repetition of any lines and spaces, and all diametrical divisions, or, if these be forced upon him by the shape of the object, exercising the utmost ingenuity to disguise the fact, and train away the eye from observing the weak point, as nature does in like circumstances. Thus if a lacquer box in the form of a parallelogram is the object, Japanese artists will not divide it in two equal parts by a perpendicular line, but by a diagonal, as offering a more pleasing line and division. If the box be round, they will seek to lead the eye away from the naked regularity of the circle by a pattern distracting attention, as, for example, by zigzagging the circular outline, or ornamented by floral ornaments. A similar feeling is shown by them as colourists, and, though sometimes eccentric and daring in their contrasts, they never produce discords in their chromatic scale. They have undoubtedly a fine sense of colour, and a similarly delicate and subtle feeling for harmonious blending of brilliant and sober hues. As a rule they prefer a quiet and refined style, using full but low-toned colours. They know the value of bright colours, however, and how best to utilize them, both supporting and contrasting them with their secondary and complementaries.

The development of Japanese painting may be divided into the following six periods, each signalized by a wave of progress.

Division into Periods.

1. From the middle of the 6th to the middle of the 9th century: the naturalization of Chinese and Chino-Japanese Buddhist art.
2. From the middle of the 9th to the middle of the 15th century: the establishment of great native schools under Košo no Kanaoka and his descendants and followers, the pure Chinese school gradually falling into neglect.
3. From the middle of the 15th to the latter part of the 17th century: the revival of the Chinese style.
4. From the latter part of the 17th to the latter part of the 18th century: the establishment of a popular school.
5. From the latter part of the 18th to the latter part of the 19th century: the foundation of a naturalistic school, and the first introduction of European influence into Japanese painting; the acme and decline of the popular school.
6. From about 1875 to the present time: a period of transition.

Reference is due to the tradition of a Chinese artist named Nanriu, invited to Japan in the 5th century as a painter of the Imperial banners, but of the labours and influence of this man and of his descendants we have no record.

The real beginnings of the study of painting and sculpture in their higher branches must be dated from the introduction of Buddhism from China in the middle of the 6th century, and for three centuries after this event there is evidence that the practice of the arts was carried on mainly by or under the instruction of Korean and Chinese immigrants.

The paintings of which we have any mention were almost limited to representations of Buddhist masters of the Tang dynasty (638–905), notably Wu Tao-tzu (8th century), of whose genius romantic stories are related. The oldest existing work of this period is a mural painting, in the year of the temple of Horyu-ji, attributed to a Korean priest named Donchō, who lived in Japan in the 6th century; and this painting, in spite of the destructive effects of time and exposure, shows traces of the same power of line, composition, and colour as the best of the later examples of Buddhist art.

The native artist who created the first great wave of Japanese painting was a court noble named Košo no Kanaoka, living under the patronage of the emperor Seiwa (850–859) and his successors down to about the end of the 9th century, in the midst of a period of peace and culture. Of his own work few, if any, examples have reached us; and those attributed with more or less probability to his hand are all representations of Buddhist divinities, showing a somewhat formal and conventional design, with a masterly calligraphic touch and perfect harmony of colouring. Tradition credits him with an especial genius for delineation of animals and landscape, and commemorates his skill by a curious anecdote of a painted horse which left its frame to ravage the fields, and was reduced to pictorial stability only by the sacrifice of its eyes. He left a line of descendants extending far into the 15th century, all famous for Buddhist pictures, and some engaged in establishing a native style, the Wa-gwa-ryū.

At the end of the 9th century there were two exotic styles of painting, Chinese and Buddhist, and the beginning of a native style founded upon these. All three were practised by the same artists, and it was not until a later period that each became the badge of a school.

The Chinese style (Kara-ryū), the fundamental essence of all Japanese disintegrated, has a history, dating back to the introduction of Buddhism into China (A.D. 62), and it is said to have been chiefly from the works of Wu Tao-tzu, the master of the 8th century, that Kanaoka drew his inspiration. The early Chinese manner, which lasted in the country down to the period of its senility, was characterized by a virile grace of line, a grave dignity of composition, striking simplicity of technique, and a strong but incomplete naturalistic ideal. The colouring, harmonious but subdued in an every delicate sense of line and outline, the value of the line, and was frequently omitted altogether, even in the most famous works. Shadows and reflections were ignored, and perspective, approximately correct for landscape distances, was isosmorial for figures. Chinese black and white and occasional use of water-colours, brushes, usually of Deer-hair, and a surface of unsized paper, translucent silk or wooden panel. The chief motives were landscapes of a peculiarly wild and romantic type, animal life, trees and flowers, and figure compositions drawn from Chinese Buddhist history and Taoist legend; and these, together with the grand aims and strange shortcomings of its principles and the limited range of its methods, were adopted almost without change. It was a noble art, but unfortunately the rivalry of the Buddhist and later native styles permitted it to fall into comparative neglect, and it was left for a few of the faithful, the most famous of whom was a priest of the 14th century named Kawo, to preserve it from oblivion till the last period of the 15th century. The stamp of traditional Chinese influence was left upon the next period. The reputed founder of Japanese caricature may also be added to the list. He was a priest named Kakyū, but better known as the abbot of Toda, who lived in the 12th century. An accomplished artist, the first to introduce the comic spirit into Japanese painting, his works are characterized by burlesque sketches, marked by a grace and humour that his imitators never equalled. Later, the motive of the Toda pictures, such as caricatures were called, tended to degenerate, and the elegance by which they were replaced by something often substituted indecency and ugliness for art and wit. Some of the old masters of the Yamato school were, however, admirable in their rendering of the burlesque, and in modern times Kyōsai, the last of the old Japanese school, outdid his predecessors and the originality of his weird and comic fancies. A new phase of the art now lives in the pages of the newspaper press.

The Buddhist style was probably even more ancient than the Chinese, as indeed it seems to have been that the Buddhist picture was almost certainly of Indian origin; brilliant and decorative, and heightened by a lavish use of gold, it was essential to the effect of a picture destined for the dim light of the Buddhist temple. The style was applied only to the representations of sacred personages and scenes, and...
as the traditional forms and attributes of the Brahmanic and Buddhist divinities were mutable only within narrow limits, the subjects seldom afforded scope for originality of design or observation of nature. The principal Buddhist painters down to the 12th century were members of the court school, and these canons, the first descended from Kankaoka, the second from Takuma Tameji (ending 10th century), and the third from Fujiwara no Motonobu (11th century). The last and greatest master of the school was, however, Minamoto no Motonobu, who was appointed as Chief Druid, or Chuden, of the Japanese Fra Angelico. It is to him that Japan owes the possession of some of the most stately and most original works in her art, sublime in conception, line and colour, and deeply instinct with the religious spirit. He was the 1st of the great Buddhist painters who left the seclusion of the temple where he had passed the whole of his days.

The native style, Yamato or Wa-gawa-ryû, was an adaptation of Chinese art forms to motives drawn from the court life, poetry and stories of old Japan. It was undoubtedly practiced by the successors, but did not take shape as a school until the beginning of the 11th century under Fujiwara no Motonobu, who was a pupil of Kose no Kincho; it then became known as Tosa-ryû, a title which two centuries later was changed to that of Tosa, on the occasion of one of its masters, Fujiwara no Tsunetaka, assuming that appellation as a family name. The Yamato-Tosa artists painted in all styles, but that which was the specialty of the school, to be found in nearly all the historical roles bequeathed to us by their leaders, was a lightly-touched outline filled in with flat and bright body-colours, in which verdigris-green played a great part. The originality of the motive did not prevent the adoption of many of those attributes which distinguished the work of the artist's own. The curious expedient of spiriting away the roof of any building of which the artist wished to show the interior was one of the most remarkable of these. Amongst the foremost names in the school were those of Juunen (14th century), Mitsuho (13th century, and Matsunaga (16th century), and his son, Mitsuho (17th century). The struggle between the Taira and Minamoto clans for the power that they had enjoyed in theocratic days lasted through the 11th and the greater part of the 12th centuries, ending only with the rise of Yoritomo the shoqun in 1185. These intercine disturbances had been unfavourable to any new departure in art, except in matters appertaining to arms and armor, and this led to the rise of the Tosa style. By the end of the 14th century the Tosa style had become the most popular, and the Tosa school was seated in the capital or Kyôto. The rise of the shogun and the nobility, who wished to imitate their Chinese exemplars, till the heirs to the splendid traditions of the great masters preserved little more than their conventions and shortcomings. It was time for a new departure, and this seemed to be insufficiently marked within the framework of the Tosa school, and the new movement was destined to come from the masses, whose voice had hitherto been silent in the art world.

A new era in art began in the latter half of the 17th century with the establishment of a popular school under an embroiderer's draughtsman named Hishigawa Moronobu (c. 1646–1715). Perhaps no great change is ever entirely a novelty. The old painters of the Yamato-Tosa line had frequently shown something of the daily life around them, and one of the later scions of the school, named Iwasa Matakai, had even made a specialty of this class of motive; but so little is known of Matakai and his work that even his period is a matter of dispute, and the few pictures attributed to his pencil are open to question on grounds of authenticity. He probably worked some two generations before the time of Moronobu, but there is no reason to believe that his labours had any bearing on the creation and trend of the new school.

Moronobu was a consummate artist, with all the delicacy and calligraphic force of the best of the Tosa masters, whom he undoubtedly strove to emulate in style; and his pictures are not only the most beautiful but also the most trustworthy records of the life of his time. It was not to his paintings, however, that he owed his great triumphs, but to the invention of a new line of books, the illustration of books and broadsides by wood-engravings. It is true that illustrated books were known as early as 1608, if not before, but they were few and unattractive, and did little to inaugurate the new style. Moronobu realized the potentialities of this method so large, and so evoked a share in the education of his own class. It is to Moronobu that Japan owes the popularization of artistic wood-engravings, for nothing before his series of xylographic albums approached his best work in the least, and he more than his contemporaries surpassed it. Later there came abundant aid to the cause of popular art, partly from pupils of the Kano and Tosa schools, but mainly from the artisan class. Most of these artists were designers for books and broadsides, and the majority of them did nothing for the engravers. Throughout the whole of this period, embracing about a hundred years, there still continued to work, altogether apart from the men who were making the success of popular art, a large number of able painters of the Kano, Tosa, and other schools who multiplied patterns that had every merit except that of originality. These men, living in the past, paid little attention to the great popular movement, which seemed to be quite outside their social and artistic sphere and scarcely worthy of
cultural criticism. It was in the middle of the 18th century that the decorative, but relatively feeble, Chinese art of the later Ming period found favour in Japan and a clever exponent in a painter named Ryūngyuō. It must be regarded as a sad decadence from the old Chinese masters of the Ashikaga School (1222-1573) that this was fastened, from about 1700, upon the popularity of the Southern Chinese style. This was a weak affection that found its chief votaries amongst literary men ambitious of an easily earned artistic reputation. The principal Japanese masters of the school (1722-1778) have been, in volume of copies of his sketches, Taigado sansui juseki, published about 1780, is one of the best attractive albums ever printed in Japan.

The fifth period was introduced by a movement as momentous as that which stamped its predecessor—the foundation of a naturalistic school under a group of men outside the orthodox academical circles. The naturalistic principle was by no means a new one; some of the old Chinese masters were naturalistic in a broad and noble manner, and their Japanese followers could be admirably and minutely accurate when they pleased; but too many of the latter were content to construct their pictures out of fragmentary reminiscences of ancient Chinese masterpieces, not presuming to sever a rock, a tree, an ox, or a human figure, in the Chinese manner. It was a farmer’s son, named Ōkyō, trained in his youth to paint in the Chinese manner, who was first bold enough to adopt as a canon what his predecessors had only admitted under rare exceptions, the principle of an exact imitation of nature. Unfortunately, even he had not all the courage of his creed, and while he would paint a bird or a fish with perfect realism, he no more dared to trust his eyes in larger motives than did the most devout follower of Shūbun or Motonobu. He was essentially a painter of the classical schools, with the specialty of elaborate reproduction of detail in certain sections of animal life, but fortunately this partial concession to truth, emphasized as it was by a rare sense of beauty, did large service.

Ōkyō rose into notice about 1775, and a number of pupils flocked to his studio in Shijō Street, Kōtō (whence Ōkyō school). Amongst these the most famous were Goshun (1742-1811), who is sometimes regarded as one of the founders of the school; Sosen (1757-1821), an animal painter of remarkable power, but especially celebrated for his pictures of monkeys; Shūhō, the younger brother of the last, also an animal painter; Rōsetsu (1755-1799), the best landscape painter of his school; Keibun, a younger brother of Goshun; and some later followers of scarcely less fame, notably Huyen, a pupil of Keibun; Tessan, an adopted son of Sosen; Ippō and Yōsha (1788-1878), well known for a remarkable series of volumes, the Zenden kijutsu, containing a long series of portraits of ancient Japanese celebrities, Ozu and Oyū, the sons of Ōkyō, painted in the style of their father, but of so little merit as to attain great eminence. Lastly, amongst the associates of the Shijō master was the celebrated Ganku (1759-1818), who developed a special style of his own, and is sometimes regarded as the founder of a distinct school. He was, however, greatly influenced by Ōkyō’s example; and his sons, Gantai, Ganryō, and Gantoku or Renza, drifted into a manner almost indistinguishable from that of the Shijō school.

It remains only to allude to the European school, if school can be called, founded by Kōkan and Denkichi, two contemporaries of Ōkyō. These artists, at first educated in European Schools, in Nagasaki some training in the methods and principles of European painting, and left a few oil paintings in which the laws of light and shade and perspective were correctly observed. They were not, however, of sufficient capacity to render the adopted manner more than a subject of curiosity, except to a few followers who have reached down to the present generation. It is possible that the essays in perspective found in the pictures of Hokusai, Hiroshige, and some of the popular artists of the 19th century, were suggested by Kōkan’s drawings and writings.

The sixth period began about 1875, when an Italian artist was engaged by the government as a professor of painting in the Engineering College at Tōkyō. Since that time some distinguished European artists have visited Japan, and several Japanese students have made a pilgrimage to Europe to see for themselves what lessons may be gained from Western art. These students, confronted by a strong reaction in favour of pure Japanese art, have fought manfully to win public sympathy, and though their success is not yet crowned, it is not impossible that an Occidental school may ultimately be established. Thus far the great obstacle has been that pictures painted in accordance with Western canons are not suited to Japanese interiors and do not appeal to the taste of the most renowned Japanese connoisseurs. Somewhat more successful has been an attempt—inaugurated by Hashimoto Gaō and Kawabata Gyokusuke—to combine the art of the West with that of Japan by adding to the latter the chiaroscuro and the linear perspective of the former. If the disciples of this school could shake off the Sesshū tradition of strong outlines and adopt the Kano Motonobu revelation of modelling by mass only, their work would stand on a high place. But they, too, receive little encouragement. The tendency of the time is conservative in art matters.

A series of magnificent publications has popularized art and its products in a manner as could never have been anticipated. The Kokka, a monthly magazine richly and beautifully illustrated and edited by Japanese painters, has reached its 223rd number; the Shimbū Dōkan, a colossal album containing xylographic facsimiles of celebrated examples in every branch of art, has been completed in 20 volumes; the masterpieces of Kōrin and Motonobu have been reproduced in similar albums; the masterpieces of the Ukoya-e are in process of publication, and it seems certain that the Gensen, which will contain a knowledge of the development of its own art as will make for permanent appreciation. Meanwhile the intrepid group of painters in oil plod along unfailingly, having formed themselves into an association (the kokubō-kai) which gives them an opportunity to exhibit their work together, offering as a well-organized and flourishing art schools which receive a substantial measure of state aid, as well as a private academy founded by Okaku with a band of successors from the hybrid fashions of the Gaō system. Altogether the nation seems to be growing more and more interested, though its art future should be far from the lines of the past.

(With N.; F. B.)

Although a little engraving on copper has been practised in Japan of late years, it is of no artistic value, and the only branch of the art which calls for recognition is the cutting of wood-blocks for use either with colours or without. This, however, is of supreme importance, and as its technique differs in most respects from the European practice, it demands a somewhat detailed description.

The wood used is generally that of the cherry-tree, sakura, which has a grain of peculiar evenness and hardness. It is worked planewise, and the parcel is painted with a design, which is drawn by the artist, to whom the whole credit of the production generally belongs, with a brush on thin paper, which is then pasted face downwards on the block. The engraver, who is very rarely the designer, then cuts a line to the outlines with a knife, afterwards removing the superfluous wood with gouges and chisels. Great skill is shown in this operation, which achieves perhaps the finest facsimile reproduction of drawings ever known without the aid of photographic processes. A peculiar but highly artistic device is that of gradually rounding off the surfaces where necessary, in order to obtain in printing a soft and graduated mass of colour which does not terminate too abruptly. In printing with colours a separate block is made in this manner for each tint, the tint containing as a rule the mere lines of the composition, and the others providing for the masses of tint to be applied. In all printing the paper is laid on the upper surface of the block, and the impressions are taken with the paper, without a covering of paper cloth and bamboo-leaf, and called the baren. In colour-printing, the colours, which are much the same as those in use in Europe, are mixed, with rice-paste as a medium, on the block and printed, or the paper is impregnated with them before being printed on. This custom to an intelligent craftsman (who, again, is neither the artist nor the engraver) was productive in the best period of very beautiful and artistic effects, such as could never have been obtained by any mechanical process. Each separate block, or successive superposition of each block, is got mainly by the skill of the printer, who is assisted only by a mark defining one corner and another mark showing the opposite side limit.

The origins of this method of colour-printing are obscure. It has been practised to some extent in China and Korea, but there is no evidence of its antiquity in these countries. It appears to be one of the few indigenous arts of Japan. But before accepting this conclusion as final, one must not lose sight of the fact that the so-called chiaroscuro engraving was at the height of its use in Italy at the same time that embassies from the Christians in Japan visited Rome, and that it is thus possible
that the suggestion at least may have been derived from Europe. The fact that no traces of it have been discovered in Japan would be easily accounted for, when it is remembered that the examples taken home would almost certainly have been religious pictures, would have been preserved in well-known and accessible places, and would thus have been entirely destroyed in the terrible and minute extermination of Christianity by Hideyoshi at the beginning of the 17th century. Japanese tradition ascribes the invention of colour-printing to Izumiya Gonshirō, who, about the end of the 17th century, first made use of a second block to apply a tint of red (beni) to his prints. Sir Ernest SATOW states more definitively that "Sakakibara attributes its origin to the year 1695, when portraits of the actor Ichikawa Danjirō, coloured by this process, were sold in the streets of Yedo for five cash apiece." The credit of the invention is also given to Torii Kiyonobu, who, worked at this time, and, indeed, is said to have made the prints above mentioned. But authentic examples of his, now remaining, printed in three colours, seem to show a technique too complete for an origin quite so recent. However, he is the first artist of importance to have produced the broadsheets—for many years chiefly portraits of notable actors, historical characters and famous courtesans—which are the leading and characteristic use to which the art was applied. Pupils, the chief of whom were Kiyomasu, Kiyotsune, Kiyonaga and Kiyonime, carried on his tradition until the end of the 18th century, the three earlier using but few colours, while the works of the two last named show a technical mastery of all the capabilities of the process.

The next artist of importance is Suzuki Harunobu (worked c. 1760–1800), to whom the Japanese sometimes ascribe the invention of the process probably on the grounds of an improvement in his technique, and the fact that he seems to have been one of the first of the colour-print makers to attain great popularity. Katsukawa Shunsō (d. 1792) must next be mentioned, not only for the beauty of his own work, but because he was the first to introduce actors, the so-called "Meizō," or "personality," into the art. Harunobu's pupil, Kiyomitsu, who was called "Shunsō-ya"—the artist of the same name—was far less noted. Thirty-six Views of Mount Fuji (1782–1783), which is, in spite of the conventional title, includes at least forty-six. His work is catalogued in English in the Kokka (1884, p. 180). At the beginning of the 19th century the process was technically at its height, and the pupil of the great landscape artist, Hiroshige I., as well as the pupils of Toyokuni I.—Kuniyasu and Kuniyoshi—and of those of Hokusai, it at first kept pace with it. There was an undue increase in the number of blocks used, combined with the absence of careful colouring, carelessness or loss of skill in printing, brought about a rapid decline soon after 1820. This continued until the old traditions were well-nigh exhausted, but since 1880 there has been a distinct revival. The chief artists of the present generation are with skill, and the designs are excellent, though both these branches seem to lack the vigour of conception and breadth of execution of the old masters. The colours now used are almost invariably of cheap German origin, and though they have a certain pretense of ephemeral, it is to be feared—they again can not compare with the old native productions. Among workers in this style, Yoshitoshi (d. 1889), was perhaps the best. Living artists in 1906 included Toshishide, Miyagawa Shunsō—none of whom, however, is a first-class artist—Tomisuke Yeishu, Toshikata and Gekko. Formerly the colour-print artist was of mean extraction and low social position, but he has now the recognition and the hands of the professors of more esteemed branches of art. This change is doubtless due in part to Occidental appreciation of the products of his art, which were formerly held in little honour by his own countrymen, the place assigned to them being scarcely higher than that accorded to magicians and illusionists in England. European influence is largely due to his displays of unsurpassed skill in preparing xylographs for the beautiful art publications issued by the Shimbi Shōin and the Kaiun company. These xylographs prove that the Japanese art of line is in every way the best. The line of the day was not surpassed in the day of his predecessors in this line. (E. F. S.; F. B. V.)

The history of the illustrated book in Japan may be said to begin with the Ise monogatari, a romance first published in the 10th century, of which an edition adorned with woodcuts appeared in 1608. In the course of the 17th century many other works of the same nature were issued, including some in which the cuts were roughly coloured by hand; but the execution of these is not as good as contemporary European work. The date of the first use of colour-printing in Japanese book-illustration is uncertain. In 1667 a collection of designs for kimono (garments) appeared, which in the hands of several colours were made use of; but these were only employed in turn for single printings, and in no case were two of them used on the same print. It is certain, however, that the mere use of coloured inks must soon have suggested the combination of two or more of them, and it is probable that examples of this will be discovered much earlier in date than those known at present.

About the year 1680 Hishigawa Moronobu achieved a great popularity for woodcut illustration, and laid the foundations of the splendid school which followed. The names of the engravers who at his designs are known, and in fact the reputation of these craftsmen is curiously subordinated to that of the designers in all Japanese work of the kind. With Moronobu must be associated Toshihide, the younger brother, whose works are, perhaps in date, whose work is also of considerable value. During the ensuing thirty years numerous illustrated books appeared, including the earliest known which are illustrated by colour-printing. Nichikawa Sukenobu (1671–1751) issued a very large number of books, many of which were published only after his death. With Sukenobu are associated Ichirō Shōbunkō (d. c. 1779) and Tsukiko Tange (1716–1786), the latter of whom made the drawings for many of the meishō or guide-books to which his work contributed. But perhaps the most important of all the Japanese illustrators was the work of Toshinobu Moronobu (1670–1749), who was of the first teachers in the art. The development of the art of Japanese colour-printing naturally had its effect on book-illustration, and the later years of the 18th and the earlier part of the 19th century saw a vast increase of books illustrated by this art. Two subjects are of especial importance: a new series of subjects and views drawn as seen by the designers, and not reproductions of the work of other men; and also sketches of scenes and characters of every-day life and of the folk-lore in which Japan is rich. Among the greater works of this kind, Hokusai (1760–1849) is absolutely pre-eminent. His greatest production in book-illustration was the Mangō, a collection of sketches which cover the whole ground of Japanese life and legend, art and handcraft, of which consists fifteen volumes, the first ten of which were issued from 1812 to 1815, twelve being published during his life and the others from material left by him. Among his many other works may be mentioned the series of short stories Katsushika, his Harunobu, Kokchi (1880–1856) and Kyōsai were the greatest. Most of the artists, whose main work was the designing of broadsheets, produced elaborately illustrated books; and this series includes specimens of printing in colour from woodblocks, which for beauty of composition and unity of treatment perhaps never were equalled. The most celebrated of these is the series produced by Shunsō (Seirō bijin awase kagami, 1776); Utamaro (Seirō nenjū gyō, 1804); Toyokuni I. (Yabushika kōtei shikishō, 1801); as well as Harunobu Yeishu (Onna sanju rokkasen, 1798). Katsuo Masanobu and Tsuchana Minkō, each of whom produced beautiful work of the same nature. In the period next following, the chief artists were Keisai Yōshin (Keisai so-gusa, 1832) and Kikuchi Yōsai (Zenken kyōsō), the latter of whom ranks perhaps as high as any of the artists of the period. Among the book-illustrators of our own generation must be again mentioned Kyōsai; Kōno Bairei (d. 1895), whose books of books—the Bairei kyokudai zu (1885–1886) and Yatsushira-motsuki (1885)—are of unusual merit in their kind; and Imao, who issued a beautiful set of illustrations of birds and flowers (Keinen kawacho gafu), engraved by Tanaka Jirokichi and printed by Miki Nisaburō (1891–1952); and Watanabe Seitei, whose studies of similar subjects (Ukiyoe shiren) were also very good, and the Bijutsu sekai (1894), engraved by Gotō Tokujirō. Mention should also be made of several charming series of fairy tales, of which that published in English by the Kobunsha in Tokyo in 1895 is perhaps the best. Among the other illustrators of the 19th century the Japanese are entirely abreast of Western nations, the chromolithographs and other reproductions in the Kokka, a periodical, of Japanese works of art (begun in 1889), in the superb albums of the Shimbi Shōin, and in the publications of Oga being of quite a high order of merit. ancient date in Japan. Its antiquity is not, indeed, comparable to that of ancient Egypt or Greece, but no country besides Japan can boast a living and highly developed art that has numbered upwards of twelve centuries of unbroken and brilliant productiveness. Setting aside rude prehistoric essays in stone and metal, which have special interest for the antiquary, we have examples of sculpture in wood and metal, magnificent in conception and technique, dating from the earliest periods of what we may term historical Japan; that is, from near the beginning of the great Buddhist propaganda under the emperor Kimméi (540-571) and the princely hierarch, Shôtoku Taishi (573-621). Stone has never been in favour in Japan as a material for the higher expression of the sculptor’s art.

The first historical period of gymnic art in Japan reaches from the end of the 6th to the end of the 12th century, culminating in the work of the great Nara sculptors, Unkei and his pupil Kawaike. Happily, there are still preserved in the great temples of Japan, chiefly in the ancient capital of Nara, many noble relics of this period.

The place of honour may perhaps be conferred upon sculptures in wood, the Indian Buddha, Aaanga and Vasabandhu, preserved in the Golden Hall of Kofuku-ji, Nara. These are attributed to a Kamakura sculptor of the 8th or 9th century, and in simple and realistic dignity of pose and grand lines of composition they surpass in comparison with works of any earlier date.

With these may be named the demon lantern-bearers, so perfect in the grotesque treatment of the diabolical heads and the accurate anatomical forms of the sturdy body and limbs; the colossal temple guardian statues of the great gate of Tōdai-ji, by Unkei and Kawaike (11th century), somewhat conventionalized, but still bearing evidence of direct study from nature, and inspired with intense energy of action; and the smaller but more accurately modelled temple guardians in the same school, which almost compare with the gladiator "in their realization of menacing strength. The "godess of art" of Akishino-dera, Nara, attributed to the 8th century, is the most graceful and least conventional of female sculptures in Japan, but infinitely remote from the femine conception of the Greeks. The wooden portrait of Vimalakirtti, attributed to Unkei, at Kofuku-ji, has some of the qualities of the images of the two Indian Buddhists. The sculptures attributed to Jōchō, the founder of the Nara school, although powerful in pose and masterly in execution, lack the truth of observation seen in some of the earlier and later masterpieces.

The most perfect of the ancient bronzes is the great image of Bhaiyang, Phiri in the temple of Yenchin, Nara, attributed to a Korean monk of the 7th century, named Gōgi. The bronze image of the same divinity at Hōryū-ji, said to have been cast at the beginning of the 7th century by Tori Busshi, the grandson of a Chinese sculptor, is considered not inferior in workmanship or in design to the former. The colossal Nara Daibutsu (Vairocana) at Tōdai-ji, cast in 749 by a workman of Korean descent, is the largest of the great bronzes in Japan, but ranks far below the Yakushi-ji images. The work was unfinished, however, is a later substitute for the original, which was destroyed by fire.

The great Nara school of sculpture in wood was founded in the early part of the 11th century by a sculptor of Imperial descent named Jōchō, who is said to have modelled his style upon that of the Chinese wood-carvers of the Tang dynasty; his traditions were maintained by descendants and followers down to the beginning of the 13th century. All the artists of this period were men of aristocratic rank and origin, and were held distinct from the Carpenter-architects of the imposing temples which were to contain their works.

Sacred images were not the only specimens of gymnic art produced in these six centuries; reliquaries, bells, vases, incense-burners, and many other objects, showing no less mastery of design and execution, have reached us. Gold and silver had been applied to the adornment of helmets and breastplates from the 7th century, but it was in the 12th century when the great development of elaboration shown us in the armour of the Japanese Bayard, Yotsuhitsu, which is still preserved at Kasuga, Nara.

Wooden masks employed in the ancient theatrical performances were not only decorative but were fashioned in a distinctive and strikingly grotesque phase of wood-carving. Several families of experts have been associated with this class of sculpture, and their designs have been carefully preserved and imitated down to the present day.

The second period in Japanese gymnic art extends from the beginning of the 13th to the early part of the 17th century. The great struggle between the Taira and Minamoto clans had ended, but the martial spirit was still strong, and brought work for the artists who made and ornamented arms and armour.

The Miyōchins, a line that claimed ancestry from the 7th century, were at the head of their calling, and their work in iron breast-plates and helmets, chiefly in repoussé, is still unrivalled. It was not until the latter half of the 15th century that there came into vogue the elaborate decoration of the sword, a fashion that was to last four hundred years.

The metal guard (tsuba), made of iron or precious metal, was adorned with engraved designs, often inlaid with gold and silver. The free end of the hilt was crowned with a metallic cap or pomel (kashiha), the other extremity next the tsuba was embraced by an oval ring (kashira) to which the niwaki, or end of the mount called the menuki, all adapted in material and workmanship to harmonize with the guard. The kodokusa, or handle of a little knife implanted into the sheath of the short sword or dagger, was also of engraved metal. Many sculptors, besides being armourers, were painters, and the great line of tsuba and menuki artists was Gotō Yūjō (1450-1512), a friend of the painter Kano Motonobu, whose designs he adopted. Many families of sword artists sprang up at a later period, furnishing treasures for the collector even down to the present day, and their works reached a level of technical mastery and refined artistic judgment almost without parallel in the art industries of Europe. Buddhist sculptor was by no means neglected during this period, but there are few works that call for special notice. The most noteworthy effort was the casting by Ono Goro'yemon in 1452 of the well-known bronze image, the Kamakura Daibutsu.

The third period includes the 17th, 18th and the greater part of the 19th centuries. It was the era of the artisan artist. The makers of Buddhist images and of sword ornaments carried on their work with undiminished industry and success, and some famous schools of the latter arose during this period. The Buddhist sculptors, however, tended to grow more conventional and the metal-workers more naturalistic as the 18th century became t wane. It was in connexion with architecture that the great artisan movement began. The initiator was Hidarì Jingoro (1594-1652), at first a simple carpenter, afterwards one of the most famous sculptors in the land of great artists. The gorgeous decoration of the mausoleum of Iyeyasu at Nikkō, and of the gateway of the Nishi Hongwan temple at Kūto, are the most striking instances of his handiwork on timber.

The pillars, architraves, ceilings, panels, and almost every available part of the structure, are covered with arabesques and sculptured figures of dragons, lions, tigers, birds, flowers, and even pictorial compositions with landscapes and figures, deeply carved in solid or open work, and inlaid with precious metals and jewels. Until the death of Iyeyasu, in 1616, the movement flourished in Kyōto and throughout the whole of Japan. The designs for these decorations, like those of the sword ornaments, were adopted from the great schools of painting, but the invention of the sculptor was by no means idle. From the temple of the carpenters' guild, took a place apart from the rest of their craft, and the genius of Hidarì Jingoro secured for one important section of the artisan world a recognition like that which Hishigawa Moronobu, the painter and book-illustrator, afterwards won for another.

A little later arose another art industry, also emanating from the masses. The use of tobacco, which became prevalent in the 17th century, necessitated the pouch. In order to suspend this from the girdle there was employed a kind of button or toggle—the netsuke. The metallic bangle and mouthpiece of the pipe were kept in their proper receptacle, the netsuke, by the clasp of the pouch; and the netsuke, being made of wood, ivory or other material susceptible of carving, also gave occasion for art and ingenuity.

The engravers of pipes, pouch clasps, and the metallic discs (kagami-buta) attached to certain netsuke, sprang from the same class and were not less original. They worked, too, with a skill little inferior to that of the Gotōs, Naras, and other aristocratic sculptors of sword ornaments, and often with a refinement which their relative isolation in education and daily environment tended to render markable. The netsuke and the pipe, with all that pertained to it, were for the commoners what the sword-hilt and guard were for the gentry. Neither class cared to bestow jewels upon their persons, but neither sculpture or metal was ever rejected; and it was to the latter, they most loved. The final manifestation of popular gymnic art was the okimon, an ornament pure and simple, in which utility was altogether secondary in intention to decorative effect. Its manufacture as a special branch of art works dates from the rise of the naturalistic school of painting and the great expansion of the popular school under the Katsugawa, but the okimon formed an occasional amusement of the older gymnic artists. Some of the most exquisite and
most ingenious of these earlier productions, such as the magnificient iron eagle in the South Kensington Museum, the wonderful articulated models of crayfish, dragons, serpents, birds, that are found in many European collections, came from the studios of the Miyōchins; but these were the play of giants, and were not made as articles of commerce. The new artisan masters of the okimo struck out a line for themselves, one influenced more by the naturalistic and popular schools than by the classical art, and the guails of Kamejo, the tortoises of Seimin, the dragons of Tsun and Tomiy, and in recent years the falcons and the peacocks of Suzuki Chokichi, are the joy of the European collector. The best of these are exquisite in workmanship, graceful in design, and strikingly original in conception, and usually of material of: ---

The present generation is more systematically commercial in its gylptic produce than any previous age. Millions of commercial articles in metal-work, wood and ivory float the European markets, and may be bought in any street in Europe at a small price, but they offer a variety of design and an excellence of workmanship which place them almost beyond Western competition. Above all this, however, the Japanese sculptor is a force in art. He is nearly as thorough as his forefathers, and maintains the same love of all things beautiful; and if he cannot show any epoch-making novelty, he is at any rate doing his best to support unsuspected the decorative traditions of the past. History has been eminently careful to preserve the names and records of the sculptors of ancient times, who chiselled the wood and furniture. The sword being regarded as the soul of the samurai, every one who contributed to its manufacture, whether as forger of the blade or sculptor of the furniture, was held in high repute. The Gotō family worked steadily during 14 generations, and its 15th century representative—Gotō Ichijō—will always be remembered as one of the family's greatest experts. But there were many others whose productions fully equalled and often excelled the best efforts of the Gotō. The following list gives the names and periods of the most renowned families:—

(1st, it should be noted that the division by centuries indicates the time of a family's origin. In a great majority of cases the representatives of each generation worked on through succeeding centuries),

**Sword-making Families.**

Miyōchin; Gotō; Umeda; Muneta; Aoki; Sōami; Nakai.

**17th Century.**

Kuwamura; Mizuno; Koichi; Nagayoshi; Kuninaga; Yoshishige; Kataogi; Tsuji; M. Shinozaki; Tadahira; Shōhō; Hossan; Yokoya; Nara; Okada; Okamoto; Kinai; Akao; Yoshio; Hitaka; Komura; Komakabayashi; Inouye; Yasui; Chiyō; Kaneko; Uemura; Iwamoto.

**18th Century.**

Gorobei; Shōemon; Kikigawa; Yasuyama; Node; Tamagawa; Fujita; Kikoku; Kizemon; Hamano; Omori; Okamoto; Kashiwaya; Kusakari; Shichibei; Itō.

**17th Century.**

Natsuo; Ishiguro; Yanagawa; Honjo; Tanaka; Okano; Kawarabayashi; Oda; and many masters of the Omori, Hamano and Iwamoto families, as well as the five experts, Shuraku, Temmin, Ryūmin, Minjō and Minkō. (W. An.: F. Bv.)

There is a radical difference between the points of view of the Japanese and the Western connoisseur in estimating the merits of sculpture in metal. The quality of the chiselling is the first feature to which the Japanese Point of View directs his attention; the decorative design is the prime object of the Occidental's attention. With very rare exceptions, the decorative motives of Japanese sword furniture were always supplied by painters. Hence it is that the Japanese connoisseur draws a clear distinction between the decorative design and its technical execution, crediting the former to the swordsman and the latter to the sculptor. He detects in the stroke of a chisel and the lines of a graving tool subjective beauties which appear to be hidden from the great majority of Western dilettanti. He estimates the rank of a specimen by the quality of the chisel-work. The Japanese kimakushi (metal sculptor) uses thirty-six principal classes of chisel, each with its distinctive name, and as most of these classes comprise from five to ten sub-varieties, his cutting and graving tools aggregate about two hundred and fifty.

Scarcely less important in Japanese eyes than the chiselling of the decorative design itself is the preparation of the field to which it is applied. There used to be a strict canon, with reference to this in former times. Namako (fish-roe) grounds were essential for the mountings of swords worn on ceremonial occasions, the ishime (stone-pitting) or jimigashi (polished) styles being considered less aristocratic.

Namako is obtained by punching the whole surface—except the portion carrying the decorative design—into a texture of microscopic dots. The first makers of namako did not aim at regularity in the size or position of these minuscule chisel-rows; but the effect of millet-seed sifted haphazard over the surface. But from the 15th century the punching of the dots in rigidly straight lines came to be considered essential, and the difficulty involved was so great that namako-making took place among the highest social achievements of the sculptor. When it is remembered that the punching tool was guided solely by the hand and eye, and that three or more blows of the mallet had to be struck for every dot, some conception may be formed of the patience and accuracy needed to produce these tiny protruberances in perfectly straight lines, at exactly equal intervals and of absolutely uniform size. Namako disposed in straight parallel lines originally ranked at the head of this kind of work. But a new kind was introduced in the 16th century. It was obtained by arranging the dots so as to follow the line of the curve, which was introduced into each of the dot-fords in five each. This is called go-no-me-namako, because of its resemblance to the gridiron. A century later, the daimyō namako was invented, in which lines of dots alternated with lines of polished ground. Ishime may be briefly described as a furr. There is scarcely any limit to the ingenuity of the Japanese expert in diapering a metal surface. It is not possible to enumerate here even the principal styles of ishime, but mention may be made of the sara-maki (broad-cast), in which the surface is finely but irregularly pitted after the manner of the face of a stone; the nashi-ji (pear-ground), in which we have a surface like the rind of a pear; the hori-ishime (needle ishime), where the indentations are so minute that they seem to have been made with the point of a needle; the gama-ishime, which is intended to imitate the skin of a toad; the tsuya-ishime, produced with a chisel sharpened so that its traces have a lustrous appearance; the ore-kuchi (broken-tool), a peculiar kind obtained with a jagged tool; and the gosame, which resembles the plated surface of a fine straw mat.

Great importance has always been attached by Japanese experts to the patina of metal used for artistic chiselling. It was mainly for the sake of their patina that value attached to the remarkable alloys shakudo (3 parts of gold to 97 of copper) and shibuchi (1 part of silver to 99 of copper). Neither metal, when it emerges from the furnance, has any beauty, shakudo being simply dark-coloured copper and shibuchi pale gun-metal. But when copper is copper, in the true meaning of the word, it means a patina with violet sheen, and the latter shows beautiful shades of grey with silvery lustre. Both these compounds afford delicate, unobtrusive and effective grounds for inlaying with gold, silver, and other metals, and sculpture, when completed in and nailed to a base of copper. Copper, too, by patina-producing treatment, is made to show not merely a rich golden sheen with pleasing limpidity, but also a host of various hues, from deep coral to light vermilion, several shades of green and salt; then washed with wosu and placed in a tub of water to remove all traces of alkali, the final step being to digest in a boiling solution of copper sulphate, verdigris and water.

1 It is first boiled in a lye obtained by lixiviating wood ashes; it is then washed with charcoal powder; then immersed in plume or salt; then washed with wosu and placed in a tub of water to remove all traces of alkali, the final step being to digest in a boiling solution of copper sulphate, verdigris and water.
sparks instead of using it as a common cutting tool. They succeeded admirably. In the kata-kiri-bori every line has its proper value in the pictorial design, and strength and directness become cardinal elements in the strokes of the burn just as they do in the brushwork of Sumie painting. The artist must be an expert, both in the use of the tool and in the craft, or else his work is imperfect, even if he be a master of the brush too, whether the field of the decoration was silk, paper or metal. The artist’s tool, be it brush or burin, must perform its task by one effort. There must be no appearance of subsequent deepening, or ejection of metal. The burin must be treated as a kind of engraving tool, and the burin expert is a delight. One is lost in astonishment at the nervously yet perfectly regulated force and the unerring fidelity of every trace of the chisel. Another variety of carving much affected by artists of the form is the so-called tobi-yaki-zogan or niku-ai-bori. In this style the surface of the design is not raised above the general plane of the field, but an effect of projection is obtained either by recessing the whole space immediately surrounding the form, or by inlaying the part. In the one case the chisel and in the other and another and very favourite method, giving beautiful results, is to model the design on both faces of the metal so as to give a sculpture in the round. The fashion is always accompanied by chiselling à jour (kiri-bori), so that the sculptured portions stand out in their entirety.

Inlaying with gold or silver was among the early forms of decoration in Japan. The skill developed in modern times is at least equal to anything which the past can show, and the process employed in long-established inlaying practice are two principal kinds of inlaying: the first called hon-zogan (true inlaying), the second nunome-zogan (linen-mesh inlaying). As to the former, the Japanese method does not differ from that seen in the works produced in the west. The gold or silver sub-surface is channelled out, and the thick gold or silver Chinese produced from the Suen-De era (1426–1436). In the surface of the metal the workman cuts grooves wider at the base than at the top, and then hammers in to gold or silver wire. Such a process produces a gold or silver line, and forms a more or less complicated pattern. The nunome-zogan is more interesting. Suppose, for example, that the artist desires to produce an inlaid diaper. His first business is to chisel a diaper into the metal. Thus, for a diamond-petal diaper the chisel is carried across the face of the metal horizontally, tracing a number of parallel bands divided at fixed intervals by ribs which are obtained by merely striking the metal. The groove cut is fixed in position by hammering and the whole process is then repeated in another direction, so that the new bands cross the old at an angle adapted to the nature of the design. Several independent chisellings may be necessary before the lines of the diaper are well defined. After this comes the measurement of any kind is taken, the artist being guided entirely by his hand and eye. The metal is then heated, not to redness, but sufficiently to develop a certain degree of softness, and the workman, taking a very thin sheet of gold (or silver), hammers portions of it into the salient points of the design. In ordinary cases this is the sixth process. The seventh is to hammer gold into the outlines of the diaper, the eighth, to hammer it into the pattern filling the spaces. The metal is thus chiselled in all the details. Of course the more intricate the design the more numerous the processes. It is scarcely possible to imagine a greater effort of hand and eye than this nunome-zogan displays, for while intricacy and elaboration are carried to the very extreme, absolute accuracy is obtained, sometimes in the same design we see gold, silver or thick lines, but only of a small number, and always by varying the alloy. A third kind of inlaying, peculiar to Japan, is sumi-zogan (ink-inlaying), so called because the inlaid design gives the impression of having been painted with India ink beneath the transparent surface of the metal. The difference between this process and ordinary inlaying is that for sumi-zogan the design to be inlaid is fully chiselled out of an independent block of metal with sides sloping so as to be broader at the base than at the terminal. The hollowed out object is then channelled in dimensions corresponding to those of the design block, and the latter having been fixed in the channels, the surface is ground and polished until an intimate union is obtained between the metal and the channel. The method of producing the inlaying effects are thus produced, for the design seems to have grown up to the surface of the metal field rather than to have been planted in it. Shibuiichi inlaid with shakudo used to be the commonest combination of the two methods, but these days specimens are not at all common. Nowadays we find designs inlaid by using the ash, bamboo, crow, wofu, the moon, peony sprays, etc.

A variety of decoration much practised by early experts, and characterized by a certain delicacy and elegance, is the wood-grounded ground. The process in this case is to take a thin plate of metal and beat it into another plate of similar metal, so that the two, though welded together, are not in the least bit conformed. This results in a ‘grounded’ or nake-grounded paper, which with its yellow or brown ground is very curious. The surface may be coated with hena-tsutchi (a kind of marl) and rolled in straw ash, in which state it is rosted over a charcoal fire raised to glowing heat with the bellows. The clay having been removed, another plate of the same metal is beaten in, and the same process is repeated. This is done several times, the number depending on the quality of the ‘grounding’ that the expert desires to produce. The manufactory is then heavily punched from one side, so that the opposite face protrudes in broken bisters, which are then hammered down until each becomes a centre of wave propagation. In fine work the apex of the blister is ground off before the final hammering. The iron was used exclusively for work of this kind down to the 16th century, but since then other metals have been used, and the preferred is the choice variety is gold graining in a shakudo field. By repeated hammering and polishing the expert obtains such control of the wood-grain pattern that its sinuosities and eddies seem to have developed in the artist’s fancy, but the metal itself is nothing of their fantastic grace. There are other methods of producing mokume-ji.

It has been frequently asserted by Western critics that the year (1870) which witnessed the abolition of sword-wearing in Japan, witnessed also the end of her art metal—Modern and no work. That is a great mistake. The art has continued to develop new phases in modern times. Not only are its masters as skilled now as they were in the days of the Gojō, the Nara, the Yokoya and the Yanagawa celebrities, but also their productions must be called greater in many respects and more interesting than those of their renowned predecessors. They no longer devote themselves to the manufacture of sword ornaments, but work rather at vases, censers, statuettes, plaques, boxes and other objects of a serviceable or ornamental nature. All the processes described above are practised by them with full success, and they have added others quite as remarkable.

Of these, one of the most interesting is called kiri-bame (insertion). The decorative design having been completely chiselled in the round, is then fixed in a field of a different metal, in which a design of exactly identical outline is incised or chased, or the outlines have been cut out. The result is that the picture has no blank reverse. For example, on the surface of a shibuiichi box-lid we see the backs of a flock of geese chiselled in silver, and when the lid is opened, their breasts and the under-sides of their wings appear. It is therefore necessary that the microscopic accuracy has to be attained in cutting out the space for the insertion of the design, and while the latter must be soldered firmly in its place, not the slightest trace of solder or the line of junction must be discernible, the whole picture must be kept of the same plane as the picture and that of the field in which it is inserted. Suzuki Gensuke is the inventor of this method. He belongs to a class of experts called uchimono-shi (hammerers) who perform preparatory work for goldsmiths. They chisel outstanding parts of the design, and then cut away the outlines, or in some cases the whole of the design, into thin gold or silver that can be worked as a sheet. Using the hammer only, some of them can beat out an intricate shape as truly and delicately as a sculptor could carve it with his chisels. Ohori Masatoshi, an uchimono-shi of Aizu (d. 1897), made a silver cake-box in the form of a sixteen-petalled chrysanthemum. The outlines and the lid correspond so intimately that, whereas the lid could be slipped on easily and smoothly without any attempt to adjust its curves to those of the body, it always fitted so closely that the box could be lifted by grasping the lid only. Another feat of his was to apply a lining of silver to the face of the box by shaping and hammering only, the fit being so perfect that the lining chung like paper to every part of the box. Suzuki Gensuke engraved a Koto box produced—after the latter once exhibited in Tōkyō—a silver game-cock with soft plumage and striking likeness of the most delicate character. It had been made by means of the hammer only. Suzuki’s kiribame process is not to be confounded with the kindan-zogan (inserted inlaying) of Tōyodo Kōko, also a modern artist. The gist of the latter method is that the chiselled à jour has its outlines veneered with other metal which serves to emphasize them. Thus, having pierced a spray of flowers in a thin sheet of shibuiichi, the artist fits a slender rim of gold, silver or copper, etc. No such results can be produced as transparent blossoms outlined in gold, silver or purple. Another modern development—due to Suzuki Gensuke—is the mase-gane (mixed metals). It is a singular conception, and the combination of chiselled characters or shapes is so well adapted that the various metal and effects are melted separately, and when they have cooled just enough not to mingle too intimately, they are cast into a bar which is subsequently beaten flat. The plate thus obtained shows accidental though often very appropriate and suggestive symbols. It is often considered as the basis of a pictorial design to which final character is given by inlaying with gold and silver, and by katā-kiri sculpture. Such pictures partake largely of the impressionist character, but they are greatly enhanced by the fact that they are not so much as the basis of a pictorial design to which final character is given by inlaying with gold and silver, and by katā-kiri sculpture. Such pictures partake largely of the impressionist character, but they are greatly enhanced by the fact that they are not so much
ingenious kind of work the design appears to be growing up from the depths of the metal, and a delightful impression of atmosphere and water is obtained. All these processes, as well as that of repoussé, in which the Japanese have excelled from a remote period, are now practiced, especially in the art of casting, skulls, and other ornaments, by the Nara, Osaka, and Sanyou artists. At the art exhibitions held twice a year in the principal cities there may be seen specimens of statuettes, alcove ornaments, and household utensils which show that the Japanese worker in metal may be ranked among the first artists in that field. The Occident does not yet appear to have fully realized the excellence of such talent in Japan; partly perhaps because its display in former times was limited chiefly to sword-furniture, and partly because the world's artists in that field. But, also the Japanese have not yet learned to adapt their skill to foreign requirements. They confine themselves at present to decorating plates, boxes, and cases for cigars or cigarettes, and also to teapots or coffee service; but the whole domain of salvers, dessert-services, race-cups and so on remains virtually unexplored. Only within the past few years have stores been established in the foreign settlements for the sale of silver utensils, and already the workmanship on these objects displays palpable signs of the deterioration which all branches of metal art have undergone in the attempt to cater for foreign taste. In a general sense the European or American connoisseur is more exacting than the Japanese. Broad effects of richness and splendour captivate the former, whereas the latter looks for delicacy of finish, accuracy of detail and, above all, evidences of artistic competence. It is nothing to a Japanese that a vase should be covered with profuse decoration of flowers and figures; he requires that every inch of the surface be occupied by one form or another of leaf shall be included in the composition, and there is no comparative costliness of fine workmanship does not influence his selection. But if the Japanese sculptor adopted such standards in working for foreign patrons, his market would be reduced to very narrow limits. He is already under the influence of the foreign market, and, using the mould rather than the chisel, produces specimens which show a tawdry handsomeness and are attractively cheap. It must be admitted, however, that even though foreign tastes may be regarded as insufficiently cultivated, there is probably nothing in metal that would still labour under the great difficulty of devising shapes to take the place of those which Europe and America have all learned to consider classical.

### Bronze Casting.

Bronze is called by the Japanese *kara-kone*, a term signifying “Chinese metal” and showing clearly the source from which knowledge of the alloy was obtained. It is a copper-lead-tin compound, the proportions of which are largely affected by the mixture of tin from 7% to 20% of lead and from 2 to 8% of tin. There are also present small quantities of arsenic and antimony, and zinc is found generally as a mere trace, but sometimes reaching to 6%. Gold is supposed to have found a place in ancient bronzes, but its presence has never been detected by analysis, and of silver not more than 2% seems to have been admitted at any time. Mr. W. Gowland has shown that, whatever may have been the practice of Japanese bronze makers in ancient and medieval times, their successors in later days deliberately introduced arsenic and antimony into the compound in order to harden the bronze without impairing its fusibility, so that it might take a sharper impression of the mould. Japanese bronze is well suited for castings, not only because of its low melting-point, great fluidity and capacity for taking sharp impressions, but also because it has a particularly smooth surface and readily develops a fine patina. One variety deserves special mention. It is a golden yellow bronze, called *senicki*; according to the Japanese pronunciation of *Soneki*, the name of the Mount of China whence it is said to have been invented. Copper, tin, lead and zinc, mixed in various proportions by different experts, are the ingredients, and the beautiful golden hues and glossy texture of the surface are obtained by patina-producing processes, in which branch of metal-work the Japanese show altogether unique skill.

From the time when they began to cast bronze statues, Japanese experts understood how to employ a hollow, removable core round which the metal was run in a skin just thick enough for strength without being too heavy to be understood as a mould for modelling purposes. In ordinary circumstances, a casting thus obtained took the form of a shell without any break of continuity. But for very large castings the process had to be modified. The great bronze head of Lochuan Buddha, at Nara, for example, would measure 138 ft. in height were it standing erect, and its weight is about 550 tons. The colossal Amida at Kamakura has a height only 3 ft. less. It would have been scarcely possible to cast such statues in one piece in situ, or, if cast elsewhere, to transport them and elevate them on their pedestals. The plan pursued was to build them up gradually in their places by casting segment after segment. Thus, for the Nara Dai-butsu, the mould was constructed in a series of steps ascending 12 in. at a time, until the head and neck were reached, which, of course, had to be cast in one shell, 138 ft. high.

The term “parlour bronzes” serves to designate objects for domestic use, as flower-vases, incense-burners and alcove ornaments. Bronze-casters began to turn their attention to these objects, and in the 18th century specimens of their workmanship reached the highest degree of perfection. The most famous of these is a collection of splendid sculptures in wood that graced the 11th, 12th and 13th centuries left names never to be forgotten, but undoubtedly many other artists of scarcely less force regarded bronze-casting as their principal business. Thus the story of wood-carving is very difficult to trace. Even in the field of architectural

decoration for interiors, tradition tells us scarcely anything about the masters who carved such magnificent works as those seen in the Kioto temples, the Tokugawa cottages, and some of the old castles. Some modern developments of such work are to be noted. The ability of former times exists and is exercised in the old way, though the field for its employment has been greatly narrowed.

When Japanese sculpture in wood or ivory is spoken of, the first idea that presents itself is connected with the netsuke, which, of all the art objects found in Japan, is perhaps the most essentially Japanese. If Japan had given us nothing but the netsuke, we should still have no difficulty in differentiating the bright versatility of her national genius from the conventionalistic and anti-human temperaments of the Chinese. But the netsuke may now be said to be a thing of the past. The inro (medicine-box), which it mainly served to fix in the girdle, has been driven out of fashion by the new civilised habit of dressing in the West, and the carvers have transferred their netsuke in former times now devote their chisels to statuettes and alcow ornaments. It is not to be inferred, however, that it is a favourite assertion of collectors, that no good netsuke have been removed in Japan, and that the netsuke are usually preserved. They have been removed in Japan, and that the netsuke are usually preserved. They have

The Realistic Departure.

One of the most remarkable developments of figure sculpture in modern Japan is due to Matsumoto Kisaburo (1813-1860). He carved human figures with as much accuracy as though they were destined for purposes of surgical demonstration. Considering that this man had neither anatomical training nor a medical man, and that he never enjoyed an opportunity of studying from a model in a studio, his achievements were remarkable. He and the craftsmen of the school he established completely refute the theory that the anatomical and technical training found in the works of Japan are due to faultly observation. Without scientific training of any kind Matsumoto and his followers produced works in which the eye of science cannot detect any error. It is impossible to admit with the full appreciation of their part of Asian life. The everyday men and women, unrelieved by any subjective effect, and owing their merit entirely to the fidelity with which their contours are shaped, their musculatures modelled, and their anatomical proportions observed, the whole effect is the result of an altogether unpolluted school of draughtsmen. The thoroughly realistic temperament of the Chinese is much higher than the netsuke, since anatomical defects which escape notice in the latter owing to its diminutive size, become ominous in the former.

The Scul-

foreign School.

Midway between the Matsumoto school and the pure style approved by the native taste in former times stand a number of wood-carvers headed by Takamura Koun, who once stood ahead of all others in the art of netsuke. His reputation as that held by Hashimoto Gaho in the realm of painting. Koun carves figures in the round which not only display great power of chisel and breadth of style, but also tell stories of life. The artist is always represented with one leg in front, and Shinkai Takeda, the former chiselled a figure of Jenner for the Medical Association of Japan when they celebrated the centenary of the great physician, and the latter has carved life-size effigies of two famous figures of Kioto, the Amida and the Hachiman, of which the same Koun has a copy of

The artists of the Koun school, however, do much work which appeals to emotions in general rather than to individual memories. Thus Arakawa Reiu, one of Koun's most brilliant pupils, has executed a figure of a swordman in the act of driving home a furious thrust. The weapon is not shown. Reiu has captured simply a man poised on the toes of one foot, the other foot raised, the arm extended, and the body straining forward in strong yet elastic muscular effort. A more imaginative work by the same artist is a figure of a farmer who has just shot an eagle that swooped upon his grandson. The old man holds his bow still raised. Some of the eagle's feathers, blown to his side, suggest the death of the bird; at his feet lies the corpse of the little boy, and the horror, grief and anger that would be felt are shown with great striking realism in the farmer's face. Such work has very close affinities with Occidental conceptions. The chief distinguishing feature is that the glyptic character is preserved at the expense of surface finisc. The undulating touches of story of technical force and directness which could not be suggested by perfectly smooth surfaces. To subordinate process to result is the European canon; to show the former without marring the latter is Japanese ideal. Many of Koun's carvings are unembellished, as the eyes trained in Occidental galleries, whereas the Japanese connoisseur detects evidence of a technical feat in their seeming roughness.

Architectu.

The first obvious fact is that before the 5th century the Japanese resided in houses of the very rude character. The sovereign's palace itself was merely a wooden hut. Its pillars were thrust into the ground and the whole framework—consisting of posts, beams, rafters, door-posts and window-frames —was tied together with cords made by twisting the long fibrous stems of climbing plants. The roof was thatched, and perhaps a gable at each end with a hole to allow the smoke of the wood fire to escape. Wooden doors swung on a kind of hook; the windows were mere holes in the walls. Rugs of skins or rush matting were used for sitting on, and the whole was surrounded with a palisade. In the middle of the 5th century, two-storied houses seem to have been built, but there is no trace of an actual building. In 8th century, however, when the court was moved to Nara, the influence of Chinese civilization made itself felt. Architects, turners, tile-makers, decorative artists and sculptors, coming from China and from Korea, erected grand temples for the worship of Buddha enshrining images of much beauty and adorned with paintings and carvings of considerable merit. The plan of the city itself was taken from that of the Chinese metropolis. A broad central avenue led straight to the palace, and on either side of it ran four parallel streets, crossed at right angles by smaller thoroughfares. During this century the first sumptuary edict ordered that the dwellings of all high officials and opulent civilians should have tiled roofs and be coloured red, the latter injunction being evidently intended to stop the use of logs carrying their bark. Tiles thenceforth became the orthodox covering for a roof, but vermilion, being regarded as a religious colour, found no favour in private dwellings. In the 9th century, after the capital had been established at Kioto, the palace of the sovereigns and the main temples were nobly built, and the scale of unpretentious grandeur. It is true that all the structures of the time had the defect of a box-like appearance. Massive, towering roofs, which impart an air of stateliness even to a wooden building and yet, by their graceful curves, avoid any suggestion of ponderosity, were still confined to Buddhist edifices. The architect of private dwellings attached more importance to satin-covered surfaces and careful joinery than to any appearance of strength or solidity.

Except for the number of buildings composing it, the palace had little to distinguish it from a nobleman's mansion. The latter consisted of a principal hall, where the master of the house lived, ate and slept, and of three suites of chambers, disposed on the north, the east and the west of the principal hall. In the north a suite, the lady of the house dwelt, the eastern and western suites being allotted to other members of the family. Corridors joined the principal hall to the subordinate edifices, for as yet the idea had not been evolved of having rooms on one floor but communicating with each other only by an intercommunication on the roof. The principal hall was usually 42 ft. square. Its centre was occupied by a "parent chamber," 30 ft. square, around which ran an ambulatory and a veranda, each 6 ft. wide. The parent chamber was the most magnificent part of the hall, and the ambulatory was covered, sometimes with interlacing strips of bark or broad laths, so as to produce a plaited effect; sometimes with plain boards. The veranda had no ceiling. Sliding doors, a characteristic feature of modern Japanese houses, had not yet come into use, and no means were provided for closing the veranda, but the ambulatory was surrounded by a wall of latticed timber or plain boards, the lower half of which could be removed altogether, whereas the upper half, suspended from hooks, could be swung upward and outward. Privacy was obtained by blinds of
split bamboo, and the parent chamber was separated from the ambulatory by similar bamboo blinds with silk cords for raising or lowering them, or by curtains. The thick rectangular mats of uniform size which, fitting together so as to present a level unbroken surface, covered the floor of all modern Japanese houses, were not yet in use: floors were boarded, having only a limited space matted. This form of mansion underwent little modification until the 12th century, when the introduction of the Zen sect of Buddhism with its contempt for exteriority imposed a new ideal. Interpreted, then divided into smaller rooms by means of sliding doors covered with thin rice-paper, which permitted the passage of light while obstructing vision; the hanging lattices were replaced by wooden doors at the entrance. Rising early in the day, and the alcove was added in the principal chamber for a sacred picture or Buddhist image to serve as an object of contemplation for a devotee while practising the rite of abstraction.

Thus the framework was left homogeneous, and little change took place subsequently, except that the brush of the painter was freely used for decorating partitions, and in aristocratic mansions unlimited care was exercised in the choice of rare woods.

The Buddhist temple underwent little change at Japanese hands except in the matter of decoration. Such as it was in outline when first erected in accordance with Chinese models, such it virtually remained, though in later times all the resources of the sculptor and the painter were employed to beautify it externally and internally.

The building, sometimes of huge dimensions, is invariably surrounded by a wall, which, following what is the prototype of the approach from the city, is a continuation of the gallery ralling. This gallery is sometimes supported upon a deep system of bracketing, corbeled out from the feet of the main pillars. Within this raised gallery, which is sheltered by the overhanging eaves, there is, in the larger temples, a colonnaded passage round the two sides and the front of the building, or, in some cases, placed upon the façade only. The ceilings of the halls are generally sloping, with richly carved roof-timbers showing below at intervals; andC decoration is formed by the outer pillars with the main posts of the building. Some temples are to be seen in which the ceiling of the hall is boarded flat and decorated with large paintings of dragons in black and gold. The intercolumniation is regulated by the height of the whole temple or the space of the columns, with the treatment of columns, wall-posts, &c., is that the whole mural space, not filled in with doors or windows, is divided into regular oblong panels, which sometimes receive plaster, sometimes boarding and paneling. The columns are generally square in section, and a Diagonal bracing or strutting is nowhere to be found, and in many cases mortises and other joints are such as very materially to weaken the timbers at their points of connexion. It would seem that only the lightest of the construction of temples is intended to prevent a collapse of some of these structures in high winds. The principal façade of the temple is divided in one, two or three compartments with hinged doors, variously ornamented and folding outward or inwards; these façades, generally left open, the interior light is principally obtained, windows, as the term is generally understood, being rare. An elaborate cornice of wooden bracketing crowns the walls, forming one of the principal ornamentations of the building. The design of pillars, posts is harmonically arranged according to some measure of the standard of length. A very important feature of the façade is the portico or porch-way, which covers the principal steps and is generally formed by producing the central portion of the main roof over the steps and supporting such projection upon isolated wooden pillars bracketed together near the top with horizontal ties, carved, moulded and otherwise fantastically decorated. Above these are the brackets and beams, corresponding to a superstructure, general design to the cornice of the walls, and the intermediate space is filled with open carvings of dragons or other characteristic designs. The forms of roof are various, but mostly they commence in a steep slope, and is continued for some distance, after which it produces a slightly concave appearance, this concavity being rendered more emphatic by the tilt which is given to the eaves at the four corners. The appearance of the ends of the roof is half hip, half gable, and of this type for greater variety the eaves of the main roof are carried along the ridge and the slope of the gable. The whole is very picturesque, and has the advantage of looking equally satisfactory from any point of view. The interior arrangement of wall columns, horizontal beams and cornice bracketing corresponds with that of the outside. The construction is of course, and every available point of the interior is used as a means of support.

"The floor is partly boarded and partly matted. The shrines, altars and oblation tables are placed at the back, and there is even in other secondary shrines at the sides. In the best class the floor of the gallery and of the central portion of the main building from entrance to altar are richly laced; in those of inferior class they are merely polished by continued rubbing."

(After Conder, in the Proceedings of the Royal Institute of British Architects.)

None of the magnificence of the Buddhist temple belongs to the Shinto shrine. In the case of the latter conservatism has been absolute from time immemorial. The shrines of Ise, which may be called the Mecca of Shintô devotees, are believed to present to-day precisely the appearance they presented in 478, when they were moved thither in obedience to a revelation from the Sun-goddess. It has been the custom to rebuild them every twentieth year, alternately on each of two sites set apart for the purpose, the features of the old edifice being reproduced in the new with scrupulous accuracy.

They are enlarged replicas of the primeval wooden hut described above, having rafters with their upper ends crossed; thatched or shingled roof; boarded floors, and logs laid on the roof-ridge at right angles for the purpose of binding the ridge and the rafters firmly together. The shrines are tolerably large; but in modern times tiles or sheets of copper are sometimes substituted. At Ise, however, no such novelties are tolerated. The avenue of approach generally passes under a structure called torii. On the approach, a thatched screen, the torii, is sometimes faced as the daybreak, this torii subsequently became to be erroneously regarded as a gateway characteristic of the Shintô shrine. It consists of two thick trunks placed upright, their upper ends mortised into a horizontal log which projects beyond them at either side. The structure derives some grace from its extreme simplicity.

Textile Fabrics and Embroidery.—In no branch of applied art does the decorative genius of Japan show more attractive results than in that of textile fabrics, and in none has there been more conspicuous progress during recent years. Her woven and embroidered stuffs have always been beautiful, but in former times the size and weight were reduced, if we except the curtains used for draping festival cars and the hangings of temples. Tapestry, as it is employed in Europe, was not thought of, nor indeed could the small hand-looms of the period be easily adapted to such work. All that has been changed, however. Arras of large dimensions, showing remarkable workmanship and grand combinations of colours, is now manufactured in Kioto, the product of years of patient toil on the part of weaver and designer alike. Kawashima of Kioto has acquired high reputation for work of this kind. He inaugurated the new departure a few years ago by copying a Gobelin, but it may safely be asserted that no Gobelin will bear comparison with the pieces now produced in Japan.

The most approved fashion of weaving is called tsusure-ori (linked-weaving): that is to say, the cross threads are laid in with the fingers and pushed into their places with a comb by hand, very little machinery being used. The threads extend only to the outlines of each figure, and it follows that every part of the pattern has a rim of minute holes like pierced lines separating postage stamps in a sheet, the effect being that the design seems to hang suspended in mid-air. The patterns are first embroidered on light silk, and a specimen of this nature recently manufactured by Kawashima's weavers measured 20 ft. by 13, and represented the annual festival at the Nikkô mausoleum. The chief shrine was, as were also the temple of the long Shinto, almost leading up to it, several other buildings, the groves of cryptomeria that surround the mausoleum, and the festival procession. All the architectural and decorative details, all the carvings and colours, all the accessories—show a study of the faithful that the process were exactly appropriate costume. Even this wealth of detail, remarkable as it was, seemed less surprising than the fact that the weaver has succeeded in producing the effect of atmosphere and aerial perspective—through the genius of a few hands, and the still more marvellous as could be seen, and between the buildings in the foreground and those in the middle distance atmosphere appeared to be perceptible. Two years of incessant labour with relays of artisans working steadily throughout the twenty-four hours were required to finish this piece.
such specimens are not produced in large numbers. Next in decorative importance to tsuzure-ori stands yuzen birdō, commonly known among English-speaking people as cut velvet. Dyeing by the yuzen process is an innovation of modern times. The design is painted in paint, which later is allowed to dry, and the picture is ultimately fixed by methods which are kept secret. The soft silk known as habutaye is a favourite ground for such work, but silk crapi also is largely employed. No other method permits the decorate such delicacy and such boldness of draughtsman ship. The difference between the results of the ordinary and the yuzen processes of dyeing is, in fact, the difference between a stencilled sketch and a finished picture. In the case of cut velvet, the yuzen process is used after the cutting of the threads, with a cutter's instrument. At an ordinary wooden bench, has no tool except a small sharp chisel with a V-shaped point. This chisel is passed into an iron pencil having at the end, guards, by which the point of the chisel is held in a fixed position. It is impossible to control the use of a cutting tool to a certain depth. When the velvet comes to it, already carries a coloured picture permanently fixed by the yuzen process, but the wires have not been withdrawn. It is, in fact, velvet that has passed through all the usual stages of manufacture except the cutting of the thread along each wire and the withdrawal of the wires. The cutting artist lays the piece of unfinished velvet on his bench, and proceeds to cut into the pattern with his chisel, just as though he were shading the lines of the design with a steel pencil. When the pattern is lightly traced, he uses his knife delicately; when the lines are strong and the shadows heavy, he makes the point piece deeply. In short, the little chisels becomes in his fingers a painter's brush, and when it is remembered that, the basis upon which he works is an inordinate and the relation of the cutting tool is covered only by scraping the threads, the delicacy of muscular effort as to be capable of arresting the edge of the knife at varying depths within the diameter of the tiny filament, the difficulty of the achievement will be understood. Of course the fine gradation of the edge of the cutting tool is not allowed to trespass upon the line which the exigencies of the design require to be solid. The veining of a cherry petal, for example, the tessellation of a carp's scales, the serration of a leaf's edge—all these lines require that, shaded by the cutter's tool, with the chisel or the petal, or the scales of the fish, have the threads forming them cut so as to show the velvet nap and to appear in soft, low relief. In one variety of this fabric, a slip of gold foil is laid under each wire, and the velvet is thereon the veining of the leaf on the water being then used with freedom in some parts of the design, so that the gold gleams through the severed thread, producing a rich and suggestive effect. Velvet, however, is not capable of being made in the former pieces so elaborate and hierarchically accurate as those produced by the yuzen process on silk crapi or habutaye. The rich-toned, soft plumage of birds or the magnificent blending of colours in a bunch of peonies or chrysanthemums cannot be obtained with absolute fidelity on the ribbed surface of velvet.

The embroiderer's craft has been followed for centuries in Japan with eminence, success, but whereas it formerly ranked with dyeing and weaving, it has now come to be more nearly an art than a craft. For the modern Japanese embroiderer is content to produce a pattern within his needle, now a finished picture. So perfectly does the modern Japanese embroiderer elaborate his scheme of values that all the essential elements of pictorial effects—chiaroscuro, aerial perspective and atmosphere are present in his work. Thus a graceful and realistic school has replaced the comparatively stiff and conventional style of former times. Further, an improvement of a technical character was recently made, which has the effect of adding greatly to the durability of these embroideries. Owing to the use of paper among the threads of the foundation, the embroi dering on the cloth is not only not ground, but every operation of folding used to cause perceptible injury to a piece, so that after a few years it acquired a crumpled and dingy appearance. But by the new method embroiderers now succeed in finishing their specimens which defy all destructive influences—except, of course, dirt and decay.

Ceramics.—All research proves that up to the 12th century of the Christian era the ceramic ware produced in Japan was of a very rude character. The interest attaching to it is historical rather than technical. Pottery was certainly manufactured from an early date, and there is evidence that kilns existed in some fifteen provinces in the 10th century. But although the use of the potter's wheel had long been understood, the objects produced were simple utensils to contain offerings of rice, fruit and fish at the austere ceremonial of the Shinto faith, jars for storing seeds, and vessels for common domestic use. In the 12th century, however, the introduction of tea from China, together with vessels for infusing and serving it, revealed to the Japanese a new conception of ceramic possibilities, for the potters of the Middle Kingdom had then (Sung dynasty) fully entered the road which was destined to carry them ultimately to a high pinnacle of their craft. It had long been customary in Japan to send students to China for the purpose of studying philosophy and religion, and she now (1293) sent a potter, Kato Shirozaemon, who, on his return, opened a kiln at Seto in the province of Owari, and began to produce little jars for preserving tea and cups for drinking it. These were conspicuously superior to anything previously manufactured. Kato is regarded as the father of Japanese ceramics. But the ware produced by him and his successors at the Seto kilns, or by their contemporaries in other parts of the country, had no valid claim to decorative excellence. Nearly three centuries elapsed before a radically upward movement took place, and on this occasion also the inspiration came from China. In 1530 a potter named Gorodayu Goshonzui (known to posterity as Shonzui) made his way to Puchow and thence to King-te-chen, where, after five years' study, he acquired the art of manufacturing porcelain, as distinguished from pottery, together with the art of applying decoration in blue under the glaze. Then he returned to Seto, and in 1549 had opened the second epoch of Japanese ceramics. Yet the new departure then made did not lead far. The existence of porcelain clay in Hizen was not discovered for many years, and Shonzui's pieces being made entirely with kaolin imported from China, their manufacture ceased after his death, though knowledge of the processes learned by him survived and was used in the production of greatly inferior wares. The third clearly differentiated epoch was inaugurated by the discovery of true kaolin at Izumi-yama in Hizen, the discoverer being one of the Korean potters who came to Japan in the train of Hideyoshi's generals returning from the invasion of Korea, and the date of the discovery being about 1605. Thus much premeditated, it becomes possible to speak in detail of the various wares for which Japan became famous.

The principal kinds of ware are Hizen, Kiotō, Satsuma, Kutani, Owari, Bizen, Takatori, Banko, Izumo and Yatsushiro. There are three chief varieties of Hizen ware, namely, (1) the enamelled porcelain of Arita—the "old Japan" of European collectors; (2) the enamelled porcelain of Nabeshima; and (3) the blue and white, or plain white, porcelain of Hidiro. The earliest manufacture of porcelain—as distinguished from pottery—began in the opening years of the 16th century, but it was not until about 1650 that the typical Nabeshima ware, which differs from the Arita only in being made from about a century later. The decoration was confined to blue under the glaze, and as an object of art the ware possessed no special merit. Not until the year 1620 do we find any evidence of the style for which the porcelain of Arita is now celebrated. The first porcelain from Satsuma, or Yatsushiro, as it is also called, must be placed among the earliest known examples of Japanese ceramic art, though beyond question their style of decoration was greatly influenced by Dutch interference. The porcelains of Arita were supplied to the neighbouring town of Kanazawa by sea. Hence the latter is little known to Japanese and foreigners alike as Imari-yaki (yaki = anything baked; hence ware).

The Nabeshima porcelain—so called because of its production at the factories under the special patronage of Nabeshima Naoshige, feudal chief of Hizen—was produced at Okawachiyama. It differed from Imari-yaki in the milky whiteness and softness of its glaze, the comparative sparseness of its decoration, and a distinct tendency to convert the glaze into a secondary place. This is undoubtedly the finest jewelled porcelain in Japan; the best examples leave nothing to be desired. The factory's period of excellence began about the year 1680, and culminated at the close of the 18th century.

The Hidiro porcelain—so called because it enjoyed the special patronage of Matsuruta, feudal chief of Hidiro—was produced at Mikawa-uchi-yama, but did not attain excellence until the middle of the 18th century, from which time until about 1830 specimens of rare beauty were produced. They were decorated with blue under the glaze, but some were pure white with exquisitely chiselled designs incised or in relief. The production
was always scanty, and, owing to official prohibitions, the ware did not find its way into the general market.

The history of Kiotō—where, for the most part feiace, belongs to an entirely different category from the Hizen porcelain, and was perhaps the most highly esteemed in Japan during Hideyoshi's time; for, being entirely hand-made and fired at a very low temperature, its manufacture offers few difficulties, and has consequently been carried on by amateurs in their own homes at Eiraku, to Kioto, and at Hizen. 

Kiotō is the parent of all the rest. It was first produced by a Korean who emigrated to Japan in the early part of the 16th century. But the term raku-yaki did not come into use until the close of the century, when, for the first time, the term raku (low) is found in Japanese literature. 

Awata. 

There is evidence to show that the art of decoration with enamels over the glaze reached Kiotō from Hizen in the 17th century, and that it was there flourished in the Western capital a potter of remarkable ability, named Nomura Seikusu. He immediately introduced the new method, and produced many beautiful examples of jewelled faience, having characteristic in-white, and such white as was covered with a network of fine crackle, and sparse decoration in pure full-bodied colours—red, green, and yellow. He worked chiefly at Awata, and thus brought that factory to prominence. Nomura Seikusu was, at one time, employed in the great ceramic workshops of the Iwakura family. Some specimens 

Kiyomizu. 

The first potter of the Kiyomizu school was Kiyomizu Michinobu (1614-1659), who lived at Kioto during the reign of Tokugawa Iemitsu (1614-1651). He is said to have been a pupil of the late Hideyoshi, and under whose influence he commenced his productions. 

Awata-yaki. 

There is nothing known of the Awata-yaki of the early period, but it is certain that there flourished in the Western capital a potter of remarkable ability, named Nomura Seikusu. He immediately introduced the new method, and produced many beautiful examples of jewelled faience, having characteristic in-white, and such white as was covered with a network of fine crackle, and sparse decoration in pure full-bodied colours—red, green, and silver. He worked chiefly at Awata, and thus brought that factory to prominence. Nomura Seikusu was, at one time, employed in the great ceramic workshops of the Iwakura family.

The Iwakura-yaki is somewhat obscure, and its authorship is attributed to Iwakura Tadano, who was the head of a family of potters at Kioto, and whose name is connected with the manufacture of blue-and-white porcelain. Iwakura Tadano died in 1606, but for the purposes of the historian we must look farther back.

The ceramic art at Kioto owed much to the aid of a number of Korean experts who settled there after the return of the Japanese from China. Among these were Shimazu Tsuyoshi, who commended his idea of faience to Kioto; the potter Eisen, who was a pupil of the late Hideyoshi, and whose productions were highly esteemed; and the potter Taizen, who was an able and skilful potter.

The porcelain of Kutani is among those best known to Western collectors, though good specimens of the old ware have always been scarce. Its manufacture dates from the close of the 17th century, when the feudal chief of Kaga took the industry under his patronage. There were two principal varieties of the ware: ao-Kutani, so called because of a green (ao) enamel of great brilliancy and translucency; and ko-Kutani, so called because of a red enamel, discovered by the potter Eisen in Hizen, and employed by him at Kioto in 1613. The ko-Kutani was a fine and durable ware, much esteemed by the connoisseurs of that time, and was much in demand for presentation purposes.

Kutani. 

An especially beautiful example of this ware is the porcelain of Satsuma, which was produced by the Satsuma clan of potters, and which was much sought after by the Japanese and Chinese collectors of that time. The Satsuma ware was produced in the 17th century, and was characterized by the use of rich, gold and silver enamels, and by the use of the so-called "gilding" technique, in which the ware was gilded with fine gold leaf. This ware was much in demand by the Japanese and Chinese collectors of that time.
It was at the little village of Seto, some five miles from Nagoya, the chief town of the province of Owari, or Bishii, that the celebrated Owar.  
Kato Shirozaemon made the first Japanese faience worthy to be considered a technical success. Shirozaemon produced them in the course of several years, and the various glazes he employed ranged from dark brown to russet, and covered with thick, lustrious glazes—black, amber-brown, chocolate and yellowish grey. These glazes were not monochromatic; they showed differences of tint, and sometimes the productions of the same glaze would pass from amber, or black, through streaks and clouds of grey and dead-leaf red. This ware came to be known as Toshir-yaki, a term obtained by combining the second syllable of Kato with that of his native province. Shirozaemon's glazes still present very nearly the same weight in gold to Japanese dilettantes, though in foreign eyes it is little more than interesting. Shirozaemon was succeeded at the kiln by three generations of his family, each represented by name and intrinsic character, and each distinct in the excellence of his work. Thenceforth Seto became the headquarters of the manufacture of cha-no-yu utensils, and many of the tiny pieces turned out there deserve high admiration, their technique being perfect, and their rhodonite, russet-brown, amber-brown, chocolate or yellowish monochromatic. But, having obtained the orificial arrangement, such as the term seko-mono (Seto article) came to be used generally for all pottery and porcelain, just as 'China' is in the English language, Seto has since that time become the centre of the Japanese faience industry. In the 18th century, this industry was inaugurated in Seto by Takator.  
Takatori, in the province of Chikuzen. In its early days the ceramic industry of this province owed something to the assistance of Korean experts who settled there after the expedition of 1592. One of these Koreans was a faience-decorator named Jizaemon, an amateur ceramist, who, happening to visit Chikuzen about 1620, was taken under the protection of the chief of the reticence and munificently treated. Taking the renowned yao-pien-yao, the Chinese brown or black faience, the Takatori potters endeavoured, by skilful mixing of colours, so called from its productions, to repeat the wonderful effects of oxidation seen in the Chinese ware. They did not, indeed, achieve their ideal, but they did succeed in producing some exquisitely lustrous glazes of the flambe type. It is true that the ornamental treatment of these productions was still insignificant, pieces, as tea-jars, cups and little ewers. During the 18th century, a departure was made from these strict canons. From this period date most of the specimens best known outside Japan—Awa-yaki, an imitation of Chinese brown porcelain, which is said to have been introduced to Seto with the help of the convertor, Jizaemon. Awa-yaki was first produced between the years 1830 and 1840 by one Kaji Minpei, a man of considerable private means who had the means to carry out his new ideas. He set about it as a hobby, and his story is full of interest, but it must suffice here to note the results of his enterprise. Directing his efforts at first to reproducing the deep green and straw-yellow glazes of China, he had exhausted almost all the possibilities of materials and processes before the public was slow to recognize the merits of his ware. Nevertheless he persevered, and in 1838 we find him producing not only green and yellow monochromes, but also greyish white and mirror-black glazes of high excellence. So thoroughly had he now mastered the management of glazes that he could combine yellow, green, white and claret colour in regular patches to imitate tortoise-shell. Many of his pieces have designs incised or in relief, and others are skilfully elaborated with the usual Japanese technique of allowing the|r the glaze to flow. He has even tried his hand at reproducing the reps of colored plates as well as of copper in metal.  
Banko faience is a universal favourite with foreign collectors. The potters of the province of Banko, or Suruga, near Iga, used for the most part made of light grey, unglazed clay, and having hand-modelled decoration in relief. But there are numerous varieties. Chocolate or dove-coloured grounds with delicate designs incised or in relief, or white or slightly greyish grounds, with incised lines and with the incisions filled with yellow or pink glazes, are particularly popular. These wares are called banko-yaki. They are decorated with exquisite skill and daintiness. Aka-bako-yaki, a more brilliant and deftly marbled combination of various coloured clays—these and many other kinds are to be found, all, however, presenting a common feature, namely, skilful finger-moulding and a slight roughening of the surface as though it had received the impression of coarse linen or cane before baking. This modern banko-yaki is produced chiefly at Yokaichi in the province of Ise. It is entirely different from the ware of this name as it is made in Kawan, in the same province, by Nunamrazo Gozaemon at the close of the 17th century. Gozaemon was an imitator for his models the rakud of Kito, the masterpiece of Ninsal and Kenzan, the rocco ware of Bizen, the teapot ware of China, and the blue-and-white ware of Delft. He did not, however, succeed in making anything like the beautiful wares of the foremen, because he had nothing new to teach, and the fact that a modern ware made by the same name as his productions is simply because his seal—the monogram on which (happily) everlasting suggested the name of the ware—in 1830 (Morii Yutetsu, who applied it to his own ware. Morii Yutetsu, however, had more originality than Nunamraz. He conceived the idea of shaping his pieces by putting the mould inside and pressing the clay with the fingers in the same manner as the Japanese ceramicists. Two-thirds of his wares received the design on the inner as well as on the outer surface, and were moreover thumb-marked—essential characteristics of the banko-yaki now so popular.

Many of the Japanese wares, space allows us to mention only two, those of Izumo and Yatsushiro. The chief of the former is faience, having light grey, close pate and yellow or straw-coloured glaze, with or without crackle.
to which is applied decoration in gold and green enamel. Another variety has chocolate glaze, clouded with amber and flecked with gold dust. The former faience had its origin at the close of the 17th century, the latter at the close of the 18th; but the Issun-yaki now procurable is a modern production.

The Yatsushiro faience is a production of the province of Higo, where a number of Korean potters settled at the close of the 17th century. It is the only Japanese ware in which the characteristics of a Korean original are unmistakably preserved. Its diaphanous, pearl-grey glaze, uniform, lustrous and finely crackled, overlying encaustic decoration in white slip, the fineness of its warm reddish pâte, and the general excellence of its technique, have always commanded admiration. It is produced now in considerable quantities, but the modern ware falls far short of its predecessor.

Many examples of the above varieties deserve the enthusiastic admiration they have received, yet they unquestionably belong to a lower rank of ceramic achievements than the choice productions of Chinese kilns. The potters of the Middle Kingdom, from the early era of the Ming dynasty down to the latest years of the 18th century, stood absolutely without rivals as makers of porcelain. Their technical ability was incomparable—though in grace of decorative conception they yielded the palm to the Japanese—and the representative specimens they bequeathed to posterity remained, until quite recently, far beyond the imitative power of the West. Chinese porcelain, for all its excellence and utility, however, the Chinese despised them in all forms, with one notable exception, the yi-king-yao, known in the Occident as boccaro. Even the yi-kiing-yao, too, owed much of its popularity to special utility. It was essentially the ware of the tea-drinker. If in the best specimens exquisite modelling, wonderful accuracy of finish and pâtes of interesting tints are found, such pieces are, none the less, stamped prominently with the character of utensils rather than with that of works of art. In short, the artistic output of Chinese kilns in their palmiest days was, not faience or pottery, but porcelain, whether of soft or hard paste. Japan, on the contrary, owes her ceramic distinction in the main to her faience. A great deal has been said by enthusiastic writers about the famille chrysanthemomo-bénioe of Imari and the genre Kakiemon of Nabeshima, but these porcelains, beautiful as they undoubtedly are, cannot be placed on the same level with the kwan-yao and famille rose of the Chinese experts. The Imari ware, even though its thick biscuit and generally ungraceful shapes be omitted from the account, shows no enamels that can rival the exquisitely soft, broken tints of the wide opening of the Kakiemon porcelain, for its pâte, though chaste contrasts, lacks the delicate transmitted tints of the shell-like kwan-yao. So, too, the blue-and-white porcelain of Hirado, though assisted by exceptional tenderness of sous-pâte colour, by milk-white glaze, by great beauty of decorative design, and often by an admirable use of the modelling or gravure tool, represents a ceramic achievement palpably below the soft paste kai-pien-yao of King-te-chen. It is a curious and interesting fact that this last product of Chinese skill remained unknown in Japan down to very recent days. In the eyes of a Chinese connoisseur, no blue-and-white porcelain worthy of consideration exists, or ever has existed, except the kai-pien-yao, with its imponderable pâte, its wax-like surface, and its rich, glowing blue, entirely free from superficiality or garishness and broken into a thousand tints by the microscopic crinkle of the glaze. The Japanese, although they obtained from their neighbour almost everything of value she had to give them, did not know this wonderful ware, and their ignorance is in itself sufficient to prove their ceramic inferiority. There remains, too, a wide domain in which the Chinese developed high skill, whereas the Japanese can scarcely be said to have entered it at all. The domain of monochromes and polychromes, striking every note of colour from the richest to the most delicate; the domain of transt. and flamg. glazes, of yo-pien-yao (transmutation ware), and of egg-shell with incised or translucid decoration. In all that region of achievement the Chinese potters stood alone and seemingly unapproachable. The Japanese, on the contrary, made a specialty of faience, and in that particular line they reached a high standard of excellence. No faience produced either in China or any other Oriental country can dispute the palm with really representative specimens of Satauma ware. Not without full reason have Western connoisseurs lavished panegyrics upon that exquisite production.

The faience of the Kito artists never reached quite to the level of the Satsuma in quality of pâte and glowing mellowness of decoration; their materials were slightly inferior. But their skill as decorators was as great as its range was wide, and they produced a multitude of masterpieces on which alone Japan's ceramic fame might safely be rested.

When the mediatization of the sifting, in 1871, terminated the local patronage hitherto extended so munificently to artists, the Japanese ceramists gradually learned that they must henceforth depend chiefly upon the markets of Europe and America. They had to appeal, in short, to an entirely new public, and how to secure its approval was to them a perplexing problem. Having little to guide them, they often interpreted Western taste incorrectly, and impaired their own reputation in a corresponding degree. Thus, in the early years of the Meiji era, there was a period of complete prostitution. No new skill was developed, and what remained of the old was interpreted like the prodigies of mythology, objects, disfigured by excess of decoration and not relieved by any excellence of technique. In spite of their artistic defects, these specimens were exported in considerable numbers by merchants in the foreign settlements, and their first cost being very low, they found a not unremunerative market. But as European and American collectors became better acquainted with the capacities of the pre-Meiji potters, the great inferiority of these new specimens was recognized, and the prices commanded by the old wares gradually appreciated. What then happened was very natural: imitations of the old wares were produced, and having been sufficiently disfigured by staining and other processes calculated to lend an air of rust and age, they were sold to ignorant persons, who laboured under the singular yet common hallucination that the points to be looked for in specimens from early kilns were, not technical excellence, decorative tastefulness and richness of colour, but dininess, imperfections and dirt; persons who imagined, in short, that defects which they would condemn at once in new porcelains ought to be regarded as merits in old. Of course a trade of that kind, based on deception, could not have permanent foundation. One of the immediate results of "old Satsuma" was among the first to perceive that a new line must be struck out. Yet the earliest results of his awakened perception helped to demonstrate still further the depraved spirit that had come over Japanese art. For he applied himself to manufacture wares having a close affinity with the shocking monstrosities used for sepulchral purposes in ancient Apulia, where fragments of dissected satyrs, busts of nymphs or halves of horses were considered graceful excrescences for the adornment of an amphora or a pithos. This Makuzu faience, produced by the now justly celebrated Miyagawa Shōzan of Ota (near Yokohama), survives in the form of vases and pots having birds, reptiles, flowers, crustacea and so forth plastered over the surface—specimens that disgrace the period of their manufacture, and represent probably the worst aberration of Japanese ceramic conception.

A production so degraded as the early Makuzu faience could not possibly have a lengthy vogue. Miyagawa soon began to cast about for a better inspiration, and found it in Adoption of the monochromes and polychromes of the Chinese Chinese Chinese Chinese Kung-hsi and Tung-cheng kilns. The extraordinary tendency attaching to the incomparable red glazes of China, not only in the country of their origin but also in the United States, where collectors showed a fine instinct in this matter, seems to have suggested to Miyagawa the idea of imitation. He took for model the rich and delicate "liquid-dawn" monochrome, and succeeded in producing some specimens of considerable merit. Thenceforth his example was largely followed, and it may now be said that the tendency of many of the best Japanese ceramists is to copy Chinese chefs-d'œuvre. To find them thus renewing
among the seven ceramists here enumerated, Seifū of Kiotō probably enjoys the highest reputation. If we except the ware of Satsuma, it may be said that nearly all the fine faience of Japan was manufactured formerly in Kiotō. Nomura, however, has shown that in Kiotō, but not in Satsuma, there was a long era of beautiful productions with its cream-like "fish-roe" craquelé glasses, carrying rich decoration of clear and brilliant vitrifiable enamels. It was he who gave his first really artistic impulse to the kilns of Awata, Mizo and Iwakura, whence so many delightful specimens of faience issued almost without interruption until the middle of the 19th century and continue to issue to-day. The three Kenzan, of whom the third died in 1820; Ebisei, the four Dōhachi, of whom the fourth was still alive in 1909; the Kagiyama family, manufacturers of the celebrated Kinkōzān ware; Hōzen, whose imitations of Delafontaine and his pâte-sur-pâte pieces with fern-scroll decoration remain incomparable; Taizan Haruzane, who decorated many, and was the first Kiotō manufacturer of fine specimens of Awata ware for foreign markets; Tanzan Yoshitaro and his son Rokuro, to whose credit a new era in the Japanese art of artel and minor importance, the two Büzan, renowned for their representations of richly appalled figures as decorative motives; Kōkei, who studied painting under Maruyama Ōkyō and followed the naturalistic style known as "Shōzan," and Higuchi Eijirō, the expert manufacturer of translucent porcelain in Kiotō; Shūisei, Kenkintei, and above all, Zengoro Hōzen, the celebrated potter of Iriku ware—these names and many others give to Kiotō ceramics a character and a reputation which none of the other Japanese provinces can boast. Nor is it to be supposed that the ancient capital now lacks great potters. Okamura Yasutaro, commonly called Shōzan, produces specimens which only a very acute connoisseur can distinguish from those of the European master. He manufactures half-tint enamels and soft creamy glazes which have stood high in any epoch: Taizan Yōhei produces Awata faience not inferior to that of former days; Kagiya Sōbei willingly supports the reputation of the Kinkōzān ware; Kawamoto Eijirō has made the order of a well-known Kiotō firm many specimens now figuring in foreign collections as old masterpieces; and Isó Tozan succeeds in decorating faience with seven colours sous couverte (black, green, blue, russet, violet, and white). He also makes the famous "Gyokukō" designs of the Kiotō types, their models being taken directly from China. But a sharp distinction has to be drawn between the method of Seifū and that of the other six ceramists mentioned above as following Chinese fashion. Seifū, the master of this, that whereas the latter produce their characteristic effects by mixing the colouring matter with the glaze, Seifū paints the biscuit with a pigment over which he runs a translucent colourless glaze. The Kiotō artist's process is much easier than that of his rivals. Though his monochromes are often of most delicate and fine tone, they do not belong to the same category of technical excellence as the wares they imitate. From this judgment must be excepted, however, his ivory-white and éclatant wares, as well as his decorated cups and bowls sous couverte, and with vitrifiable enamels over the glaze. In these five varieties he is emphatically great. It cannot be said, indeed, that his éclatant wares convey the same sense of purity and tenderness of colour distinguish the Eastern Kyo-yao of China, or that he has ever essayed the mossy edge of the beautiful Kyo-yao. But his éclatant certainly equals the more modern Chinese examples from the Kang-hsi and Yung-cheng kines. As for his ivory-white, it distinctly surpasses the Chinese Ming-Ching wares in every quality except an indestructible intimacy of glaze and pâte which probably can never be obtained by either Japanese or European potterers. Miyagawa Shōzan, or Makuzu, as he is generally called, has never followed Seifū's example in descending from the difficult manipulation of coloured glasses to the comparatively simple process of painted biscuit. This comment does not apply to the ware of Shōzan, the most typical and most successful of Miwara's imitations of mirror-black or raven's-wing green, and its leaves for streaking or russet-moss dappling, the prince of all wares in the estimation of the Japanese tea-club. Like Shōzan, he is still very far from complete in his art. He has produced a few pieces in his efforts to reach an ideal that will probably continue to elude him for ever. Of Kōtō there is not much to be said. He has not succeeded in winning great distinction, but he manufactures some very delicate monochromes, fully deserving to be classed among the prominent evidences of the new departure. Kiotō was never a centre of ceramic production. Even during the 300 years of its conspicuous prosperity as the administrative capital of the Tokugawa shōguns, it had no noted factories, doubtless owing to the absence of any suitable potter's clay in the immediate vicinity. Its only notable product of a ceramic character was the work of Miura Kenya (1830-1843), who followed the methods of the celebrated Rokuro's shop, decorating with wood mosaics of raku faience having coloured glazes. Kenya was also a skilful modeller of figures, and his factory in the Inado suburb obtained a considerable reputation for work of that nature. The pâte-sur-pâte wares of Kiotō, which had been produced in 1909, when using clay from Owari or Hizen, has turned out many porcelain statuettes of great beauty. But although the capital of Japan formerly played only an insignificant part in Japanese ceramic art, yet it has been now, and still is, the leader of the Japanese art of faience. Every year large quantities of porcelain and faience are sent from the provinces to the capital to receive surface decoration, and in wealth of design as well as carefulness of execution the results are scarcely inferior to the best productions of the ancient capital. The Kiotō wares of the last years could be said until very recent times. They were generally crude, of impure tone, and without depth or brilliancy. Now, however, they have lost these defects and entered a period of consider able prosperity as regards the manufacture of faience. A majority of the artists are content to copy old pictures of Buddha’s sixteen disciples, the seven gods of happiness, and other similar assemblages of mythical or historical personages, not only because such work offers large opportunity for the display of their skill in colour and the production of meretricious effects, dear to the eye of the average Western household, but also because a complicated design, as compared with a simple one, has the advantage of being more remunerative. But the Japanese decorator has happily appeared some decorators who prefer to choose their subjects from the natural field in which their great predecessors excelled, and there is reason to hope that this more congenial and much cheaper manner of work will in the near future become the best known factory in Kiotō for decorative purposes is the Hōyēn-ken. It was established in the Fukagawa suburb in 1875, with the immediate object of preparing specimens for the first Kiotō exhibition held at that time. Its founders obtained a measure of official aid and were able to secure the services of some good artists, among whom may be mentioned Onobawa and Shimauchi. The porcelains of Owari and Arita naturally received most attention at the hands of the Yokohōn decorators, but there was scarcely one of the principal wares of Japan upon which they did not try their skill, and if a piece of monochromatic Mintōon or Sērō came in their way, they undertook to improve it by the addition of designs copied from old masters and masters. Since 1875 the decoration of the Owari porcelain atelier was indiscriminately applied to all such pieces, and has probably proved a source of confusion to collectors. Many other factors or decoration were established from time to time in Owari or elsewhere, and the employment of good decorators has been abandoned. On the whole, the industry may now be said to have assumed a domestic character. In a house, presenting no distinctive features whatever, one finds the decorator with a couple of armed assistants, his tools and a piece of pigment, piece by piece, using the simplest conceivable apparatus and a meagre supply of pigments. Sometimes he fixes the decoration himself, employing for that purpose a small kiln which stands in his back room, and which is large and magnificent. The Kiotō wares of the last few years. Little by little there has been developed a degree of skill which compares not unfavourably with the work of the old masters. Table services of Owari porcelain—the ware itself excellently suited to the crystalline and of almost egg-shell fineness—are now decorated with floral scrolls, landscapes, insects, birds, figure-subjects and all
sorts of designs, chaste, elaborate or quaint; and these services, representing so much artistic labour and originality, are sold for prices that bear no due ratio to the skill required in their manufacture.

There is only one reservation to be made in speaking of the modern decorative industry of Japan under its better aspects. In Tokyó, Kioto, Yokohama and Kobe—in all of which places decorative ateliers (etsuke-do дорі) similar to those of Tokyó, have been established—Japanese potters, having been for many years contented with the simple and unadorned work of their forefathers, have been led to think of vitrifiable enamels. The result of this has been a revival of the old art, and a thorough change of the methods of production. This change is to be traced in the Japanese porcelain of the present day, which is made in the same way as the old, and is of the same quality as the ancient, but the designs and colours are different. The proper field for the application of these is the biscuit, in which position the covering glaze is reduced to a very thin layer, and thickly applied. It is carefully rubbed with a brush, and then polished, and finally heated in a high-temperature kiln, so that it becomes perfectly hard. The biscuit is then painted with the colours, and finally decorated over the glaze with vitrifiable enamels, with which the Chinese and Japanese potters of former times obtained such brilliant results. But to employ enamels successfully is an achievement demanding special training and materials not easy to procure or to prepare. The Tokyó decorators are not likely, therefore, to change their present methods immediately.

An impetus was given to ceramic decoration by the efforts of a new school, which owed its origin to Dr C. Wagener, an eminent German expert formerly in the service of the Japanese government. Dr Wagener conceived the idea of developing the art of decoration over the glaze, as applied to faience. Caucasian porcelain has a rich and varied coloring, and it was from this that the Japanese decorators took their cue, and applied the same decoration over the glaze to vitrifiable enamels, with which the Japanese and Chinese potters of former times obtained such brilliant results. But to employ enamels successfully is an achievement demanding special training and materials not easy to procure or to prepare. The Tokyó decorators are not likely, therefore, to change their present methods immediately.

lacquer

the early part of the 8th century they began to ornament it with dust of gold or mother-of-pearl, and throughout the Heian epoch (9th to 12th century) they added pictorial designs, though of a formal character, the chief motives being floral subjects, arabesques and scrolls. All this work was in the style known as hira-makie (flat decoration); that is to say, having the decorative design in the same plane as the ground. In the days of the great dilettante Yoshimasa (1449-1490), lacquer experts devised a new style, taka-makie, or decoration in relief, which immensely augmented the beauty of the ware, and constituted a feature altogether special to Japan. Thus when, at the close of the 16th century, the Taikō inaugurated the fashion of lavishing all the resources of applied art on the interior decoration of castles and temples, the services of the lacquerer were employed at an extent hitherto unknown, and there resulted some magnificent work on friezes, coffered ceilings, door panels, altar-pieces and cenotaphs. This new departure reached its climax in the Tokugawa mausolea of Yedo and Nikkō, which are enriched by the possession of the most splendid applications of lacquer decoration the world has ever seen, nor is it likely that anything of comparable beauty will ever be again produced in the same line.

Japanese connoisseurs indicate the 17th century as the golden period of the art, and so deeply rooted is this belief that whenever a date has to be assigned to any specimen of exceptionally fine quality, it is unsustainably referred to the time of Joken-in (Tsunashio).

Among the many skilled artists who have practised this beautiful craft since the first on record, Kiyohara Norisuye (c. 1169), may be mentioned Kōyetsu (1358-1357) and his pupils, who are especially noted for their inlaid lacquer (inamoe-technique); Kajikawa Kinjirō (c. 1680), the founder of the great Kajikawa family, which continued up to the 19th century; and Koma Kiyōhaku (d. 1715), whose pupils and descendants maintained his traditions for over 200 years. Of these artists, perhaps the most notable is Ogata Kōrin (d. 1790), whose skill was dedicated to the arts of painting and pottery. He was the eldest son of an artist named Ogata Sōken, and studied the styles of the Kano and Tosa schools successively. Among the artists who influenced him were Kano Tsunenobu, Nomura Sōtatsu and Kōyetsu, and he was distinguished for a bold and at times almost eccentric impressionism, and his use of lino is strongly characteristic. Ritsū (1663-1747), a pupil and contemporary of Kōrin, and like him a potter and painter, is the lacquerer of greatest skill. He adorned Kwanō (now Hanzan), the two Shime, Yamamoto Shunshō and his pupils, Yamada Jōka and Kwanōshō Tōyō (late 18th century). In the beginning of the 19th century worked Shōkwasai, who frequently collaborated with metal-workers in inlaying his lacquer with small decorations in metal by the latter.

No important new developments have taken place during modern times in Japan's lacquer manufacture. Her artists follow the old ways faithfully; and indeed it is not easy to see how they could do better. On the other hand, there has not been any deterioration; all the skill of former days is still active. The contrary has been repeatedly affirmed by foreign critics as no lacquer in Europe is of equal age, and the epoch when they have flourished is justly remembered with admiration.

But the Meiji era has had its Zeshin, and it had in 1909 Shirayama Fukumatsu, Kawanabe Ichō, Ogawa Shōmin, Uematsu Hōmin, Shibuya Maksu, and others expert artists, all masters in designing and executing Zeshin. Zetsuho, a lacquerer of the 19th century, indicated Shirayama Fukumatsu as the man upon whom his mantle should descend, and that the judgment of this really great craftsman was properly bequeathed by any one who has seen the works of Shirayama. He excels in his handling of wate and waterscapes, and has succeeded in transferring to gold-lacquer panels tender and delicate pictures of nature's softest moods—pictures of Kaya, bamboo, balance, richness and harmony of a fine sense of decorative proportion. Kawanabe Ichō is celebrated for his celebration of flowers and foliage, and Morishita Morihiachi and Asano Saburo (of Kaga) are admirable in all styles, but especially perhaps, in the charming variety called toji-dashi (ground down), which is precisely what is called for so faithful a representation of floral form and floral softness that pervades the decoration. The toji-dashi design, when finely executed, seems to hang suspended in the velvety lacquer or to float under its silken surface. The magnificent sheen and richness of the one-kēn-fake (gold-lacquer) is not for wanting, but in their place we have inimitable tenderness and delicacy.

The only branch of the lacquerer's art that can be said to have shown any marked development in the Meiji era is that in which parts of the decorative scheme consist of objects in gold, silver, shakudo, shibuichi, iron, or, above all, ivory or mother-of-pearl. It might indeed be inferred, from some of the essays published in Europe on the subject of Japan's ornamental arts, that this application of the mother-of-pearl holds a place of paramount importance. Such is not the case. Cabinets, fine-screens, plaques and boxes resplendent with gold lacquer grounds carrying elaborate and profuse decoration of ivory and mother-of-pearl, as well as some other approaches to Japanese taste. They belong essentially to the catalogue of articles called into existence to meet the demand of the foreign market, being, in fact, an attempt to adapt the lacquerer's art to decorative purposes. With this exception, however, it is a successful attempt. The plumage of gorgeously-hued birds, the blossoms of flowers (especially the hydrangea), the folds of thick brocade, microscopic diapors and arabesques, are built up with tiny fragments of mother-of-pearl. When these ornaments of gold and lacquer and coloured bone, the whole producing a rich and sparkling effect. In fine specimens the workmanship is extraordinarily minute, and every fragment of metal, shell, ivory or bone, used to construct the decorative scheme, is imbedded firmly in its place. But in a majority of cases the work of building is done by means of paste and glue only, so that the result lacks durability. The employment of mother-of-pearl to ornament lacquer grounds dates from a period as remote as the 8th century, but its use as a material for constructing decorative designs became general towards the 19th century, and was due to an expert called Shibayama, whose descendant, Shibayama Sōichi, has in recent years been associated with the same work in Tókyó.

In the manufacture of Japanese lacquer there are three processes. The first is the extraction and preparation of the lac; the second, its application; and the third, the decoration of the lacquered surface. Processes.

Lacquer.——Lacquer is an infusorial secretion of the tree anarthum, or of another species of the same genus, which is widely distributed, and is strined, deprived of its moisture, and receives an admixture of gamboge, cinnamon, acetic protoxide or some other similar substance. When this mixture has been generically made of thin white pine, is subjected to singularly thorough and painstaking treatment, one of the processes being to cover it with a layer of Japanese paper or thin hempen cloth, which is fixed by being heated. The help for this purpose is to be found in the danger of warping is averted, and exudations from the wooden surface are prevented from reaching the overlaid coats of lacquer. Numerous operations of luting, sizing, lacquering, polishing, drying, rubbing and colouring, are required, and for the reason that the surface of the already lacquered object. He takes for subject a landscape, a seascape, a battle-scene, flowers, foliage, birds, fishes, insects—shinju, kōshū, or some other object. The thick outer coats of lacquer, so called, may be of different colours, or have a coat of translucent lacquer, which is generally subject to careful polishing. It parts of the design are to be in relief, they are covered with a putty of black lacquer, white lead, camphor and lamp-black, or fine, abundant gold or gold and extreme, so that the general impression conveyed by the object is one of glow and richness. It is also an inviolable rule that every part must show beautiful and highly finished work, whether it be an external or an interior part. The mikake-shi ranks almost as high as the pictorial artist in Japanese esteem. He frequently signs his works, and a great number of names have been thus handed down during the past two centuries.

Cloisonné Enamel.—Cloisonné enamel is essentially modern development in Japan. The process was known at an early period, and was employed for the purpose of insidiously covering decoration from the close of the 16th century, but not until the 17th century did Japanese experts begin to manufacture the objects known in Europe as "enamels," that is to say, vases, plaques, censers, bowls, and so forth, having their surface covered with vitrified pastes applied either in the champlevé or the cloisonné style. It is necessary to insist upon this fact, because it has been stated with apparent authority that numerous specimens which began to be exported from 1865 were the outcome of industry commencing in the 16th century and reaching its point of culmination at the beginning of the 18th. There is not the slenderest ground for such a theory. The work began in 1836, and Kaji Tsunekichi of Owari was its originator. During 20 years previously to the reopening of the country in 1858, 1

Obtained from the shell of the Halictis.
cloisonné enamelling was practised in the manner now understood by the term; when foreign merchants began to settle in Yokohama, the fashion for this style spread rapidly in Oawari after the methods of Kaji Tsunekichi. Up to that time there had been little demand for enamels of large dimensions, but when the foreign market called for vases, censers, plaques and such things, no difficulty was found in supplying them. Thus, about the year 1865, there commenced an export of enamels which had no prototypes in Japan, being destined frankly for European and American collectors. From a technical point of view these specimens had much to recommend them. The base, usually of copper, was as thin as cardboard; the cloisons, exceedingly fine and delicate, were laid on with care and accuracy; the colours were even, and the designs showed artistic judgment. Two faults, however, marred the work—first, the shapes were clumsy and unpleasing, being copied from bronzes whose solidity justified forms unsuited to thin enamelled vessels; secondly, the colours, sombre and somewhat impure, lacked the glow and mellowness that give decorative superiority to the technically inferior Chinese enamels of the later Ming and early Tsing eras.

Very soon, however, the artisans of Nagoya (Oawari), Yokohama and Tokyō where the art had been taken up found that faithfulness to the designs of the Japanese masters combined with skill in the choise and blending of the enamels would give many and cheap specimens for export, rather than cheap and costly. There followed then a period of gradual decline, and the enamels exported to Europe showed so much inferiority that they were supposed to be the products of a widely different era and of different makers. The industry was threatened with extinction, and would certainly have dwindled to insignificant dimensions had not a few earnest artists, working in the face of many difficulties and discouragements, succeeded in striking out new lines and establishing new standards for excellence.

Three clearly differentiated schools now (1875) came into existence. One, headed by Namikawa Yasuyuki of Kiōto, took for its objects the utmost delicacy and perfection of technique, richness of decoration, purity of design and harmony of colour. The thin clumsily-shaped vases of the Kaji school, with their uniformly distributed decoration of dioramas, scrolls and arabesques in comparatively dull colours, ceased altogether to be produced, their place being taken by graceful specimens technically flawless, and carrying designs not only free from stiffness, but also executed in colours at once rich and soft. This school may be subdivided, Kiōto representing one branch, Nagoya, Tokyō and Yokohama the other. In the products of the Kiōto branch the decorative designs are quite true to the Japanese manner, while those of the other branch the artist aimed rather at pictorial effect, placing the design in a monochromatic field of low tone. It is plain that such a method as the latter implies great command of color, and that the artist who adopted it had to risk the inconspicuousness of the progress made during the period 1880-1900 in compounding and firing vitrifiable enamels. Many excellent examples of cloisonné enamel have been produced by each branch of the schools, and they stand at an immeasurable distance above the works of the early Oawari school represented by Kaji Tsunekichi and his pupils and colleagues.

The second of the modern schools is headed by Namikawa Souke of Tokyō. It is an easily traced outcome of the second branch of the first school just described, for one can readily understand that from the placing of the decorative design in a monochrome field and the use of metallic pigments the artist under the new conditions is generally framed at the outset with a ribbon of thin metal, precisely after the manner of ordinary cloisonné ware. But as the work proceeds the cloisons are hidden—unless their presence is necessary to give emphasis to the design—and the final result is a pure monochrome.

Cloisonnéless Enamels. The characteristic productions of the third among the modern schools are monochromatic and translucid enamels. All students of the ceramic art know that the monochrome porcelain, owing to the fact that the colour in the glaze, not under it. The ceramist finds no difficulty in applying a uniform coat of pigment to porcelain biscuit, and covering the whole with a diaphanous glaze. The colour is fixed by the heat of firing at a lower temperature than that necessary for hardening the pâte. Such porcelains, however, lack the velvet-like softness and depth of tone so justly prized in the genuine monochrome, where the glaze itself contains the colouring matter, pâte and glaze being fired simultaneously at the same high temperature. It is apparent that a vitrified enamel may be made to perform, in part at any rate, the function of a porcelain glaze. Acting upon that theory, the experiments of Tokyō and Nagoya have produced many very beautiful specimens of monochrome enamel—yellow (canary or straw), rose du Barry, liquid-dawn, red, aubergine purple, green (grass or leaf), dove-grey and lapis lazuli blue. The pieces do not quite reach the level of the monochromatic porcelain, but they are not far marked. The artist’s greatest difficulty is to hide the metal base completely. A monochromic loses much of its attractiveness when the colour merges into a metal rim, or when the interior of a vase is covered with crude unpasteled paste. But to spread and fix the enamel so that neither at the rim nor in the interior shall be any break of continuity, or any indication that the base is not porcelain, demands quite exceptional skill.

The translucid enamels of the modern school are generally associated with distinctive words. A suitably designed and softened lights, combined with depth and delicacy of colour, are thus obtained. But the decorative designs which lend themselves to such a purpose are not numerous. A gold base deeply chiselled in wave-diaper and overrun with a paste of aubergine purple is the most pleasing. A still higher achievement is to apply to the chiselled base designs executed in coloured enamels, finally covering the whole with translucid paste. Admirable results are thus produced: as when, through a medium of cerulean blue, bright goldfish and blue-backed carp appear swimming in silvery waves, or when the enamels seem to be melted away. The works of the artists of this school show also much skill in using enamels for the purposes of subordinate decoration—suspending enamelled butterflies, birds or floral sprays, among the reticulations of a silver vase chiselled à jour; or filling with translucid enamels parts of a decorative scheme sculptured in iron, copper, gold or shakudo.

V.—Economic Conditions

Communications.—From the conditions actually existing in the 8th century after the Christian era the first compilers of Japanese history inferred the conditions which might have existed in the 7th century before that era. One of their inferences was that, in the early days, communication was by water only, and that not until 549 a.c. did the most populous region of the empire—the west coast—come into possession of public roads. Six hundred years later, the local satraps are represented as having received instructions to build regular highways, and in the 3rd century the massing of troops for an over-sea expedition invested roads with new value. Nothing is yet heard, however, about posts. These evidences of civilization did not make their appearance until the first great era of Japanese reform, the Taika period (645-650), when stations were established along the principal highways, provision was made of post-horses, and a system of bells and checks was devised for distinguishing official carriers. In those days ordinary travellers were required to carry passports, nor had they any share in the benefits of the official organization, which was entirely under the control of the minister of war. Great difficulties attended the movements of private persons. Even the task of transmitting to the central government provincial taxes paid in kind had to be discharged by specially organized parties, and a journey from the capital to the provinces generally occupied three months.

At the close of the 7th century the emperor Mommu is said to have enacted a law that wealthy persons living near the highways must supply rice to travellers, and in 745 an empress (Koken) directed that a stock of medical necessities must be kept at the posts stations. Among the benevolent acts attributed to renowned Buddhist priests postently specially remembers their efforts to encourage the building of roads and bridges. The great emperor Kwammu (782-806) was constrained to devote a space of five years to the reorganization of the whole system of post-stations. Owing to the anarchy which prevailed during the 10th, 11th and 12th centuries, facilities of communication disappeared almost entirely, even for men of rank a long journey involved danger of starvation or fatal exposure, and the pains and perils of travel became a household word among the people.

Yoritomo, the founder of feudalism at the close of the 12th century, was too great a statesman to underestimate the value of roads and
posts. The highway between its stronghold, Kamakura, and the imperial city, Kiōto, began in his time to develop features which ultimately entitled it to be called one of the finest roads in the world. But after Yoritomo's death the land became once more an armed camp, and the Tokugawa family, who had established the shogunate within the limits of their own domains. Not until the Tokugawa family obtained military control of the whole empire (1603), and, fixing its capital at Yedo, required the feudal chiefs to reside there every second year, did any problem of roads and post-offices' formation once more be of official concern. Regulations were now strictly enforced, fixing the number of horses and carriers available at each station, the loads to be carried by them and their charges, as well as the types of services that each feudal chief was entitled to demand and the fees he had to pay in return. Tolerable hosteleries now came into existence, but they furnished only shelter, fuel and the coarsest kind of food. By degrees, however, the progress of the feudal chiefs and their mounted followers from Yedo, which in the Shogunate had been a small and economical, developed features of competitive magnificence, and the growth of good roads and suitable accommodation received increased attention. This found expression in practice in 1633. A system more elaborate than anything antecedent was then introduced under the name of "Flying Transports," and the first class of roads grew up.

The Tokaidō, so called because it ran eastward along the coast from Kiōto to Yedo. This great highway, 345 m., long, connected Osaka and Kiōto with Yedo. The date of its construction is not recorded, but it is justly believed to be anterior to the Tokugawa dynasty, for the building and improvement of roads went on steadily. It is not too much to say, indeed, that when Japan opened her doors to foreigners in the middle of the 19th century, she possessed a system of roads some of which dated back to the dynasty of the Shogun, and were flanked by rows of cryptomeria. Second only to the Tokaidō is the Nakasendō (mid-mountain road), also constructed to join Kiōto with Yedo, but follows an inland line through the valleys of Yohō, the present Omi, Mino, Shinshū, Kōtōke and Mushū. Its length is 340 m., and though not flanked by trees or possessing so good a bed as the Tokaidō, it is nevertheless a sufficiently remarkable highway. A third road, the Ōshūkaidō (now Tokyō) to Aomori on the extreme north of the main island, a distance of 445 m., and several lesser highways give access to other regions.

The question of road superintendence received early attention from the government of the restoration. At a general assembly of local prefects held at Éayō in June 1875 it was decided to classify the different roads throughout the empire, and to determine the several sources from which the sums necessary for their maintenance and repair should be drawn. After several days' discussion all roads were eventually ranged under one or other of the following heads:

I. National roads, consisting of:

Class 2. Roads leading from Kōyō to the ancestral shrines in the province of Ise, and also to the cities or to military stations.

Class 3. Roads leading from Tokyō to the prefectural offices, and those forming the lines of connexion between cities and military stations.

II. Prefectural roads, consisting of—

Class 1. Roads connecting different prefectures, or leading from the capital to the banks of rivers and the seas.

Class 2. Roads connecting the head offices of cities and prefectures with their branch offices.

Class 3. Roads connecting notarial localities with the chief town of such neighbourhoods, or leading to seaports convenient of access.

III. Village roads, consisting of:

Class 1. Roads passing through several localities in succession, or merely leading from one locality to another.

Class 2. Roads specially constructed for the convenience of irrigation, pasturage, mines, factories, &c., in accordance with measures determined by the people of the locality.

Class 3. Roads constructed for the benefit of Shintō shrines, Buddhist temples, or to facilitate the cultivation of rice-fields and arable land.

Of the above three headings, it was decided that all national roads should be maintained at the national expense, the regulations for their up-keep being entrusted to the care of the prefectures along the line of route, and the cost incurred being paid for by the Imperial treasury. Prefectural roads are maintained, on the other hand, by a joint distribution of cost between the provinces from the particular prefecture, each paying one-half of the sum needed. Village roads, being for the convenience of local districts alone, are maintained at the expense of such districts under the general supervision of the corresponding prefecture. The width of national roads was determined at 42 ft. for class 1, 36 ft. for class 2, and 30 ft. for class 3; the prefectural roads were to be from 24 to 30 ft., and the dimensions of the village roads were optional, according to the necessity of the case.

The vehicles chiefly employed in ante-Meiji days were ox-carriages, norimono, kago and carts drawn by hand. Ox-carriages were used only by people of the highest rank. They were often constructed of rich wood; the curtains suspended in front were of the finest bamboo workmanship, shorn of thick cords and tassels of plaited silk, and the draught animal, an ox of handsome proportions, was brilliantly caparisoned. The care and expense lavished upon these highly ornamented structures would have been deemed prodigious even in the days of the Shogun, but, while the expense was frequently of very ornamental nature and served to carry aristocrats or officials of high position. The kago was the humblest of all conveyances recognized as usable by the upper classes. It was an open palanquin, V-shaped in cross section, slung from a pole which rested on the shoulders of two bearers. Extraordinary skill and endurance were shown by the men who carried the norimono and the kago, but none the less these vehicles were both profoundly uncomfortable. They have now been relegated to the warehouses of undertakers, where they serve as bearers for folks too poor to employ calafualks, their place on the roads and in the streets having been completely taken by the jinrikisha, a two-wheeled vehicle pulled by one or two men who think nothing of running 20 m. at the rate of 6 m. an hour. The jinrikisha was devised by a Japanese in 1876, and since then has come into use throughout the whole of Asia eastward of the Suez Canal. Its luggage, or baggage, is carried by norimono or kago. It was necessary to have recourse to packmen, donkeys, baggage-carts drawn by men or horses. All these still exist and are as useful as ever within certain limits. In the cities and towns horses used as beastly stations to their outports, but in rural or mountainous districts straw shaws are substituted, extraneous loads which enable the animals to traverse rocky or precipitous roads with safety.

Railways.—It is easy to understand that an enterprise like railway construction, requiring a great outlay of capital with returns long delayed, did not at first commend itself to the Japanese, who were almost entirely ignorant of co-operation as a factor of business organization. Moreover, long habituated to snail-like modes of travel, the people did not readily appreciate the celerity of the locomotive. Neither the ox-cart, the norimono, nor the kago covered a daily distance of over 20 m. on the average,
and the packhorse was even slower. Amid such conditions the idea of railways would have been slow to germinate had not a cataclysmic event occurred. In 1871 a famine occurred in the southern island of Kiushiu, and while the cereal was procurable abundantly in the northern provinces, people in the south perished of hunger owing to lack of transport facilities. Sir Harry Parkes, British representative in Tokyō, seized this occasion to urge the construction of railways. Ito and Okuma, then influential members of the government, at once recognized the wisdom of his advice. Arrangements were made for a loan of a million sterling in London on the security of the customs revenue, and English engineers were engaged to lay a line between Tokyō and Yokohama (18 m.). Vehement voices of opposition were at once raised in private and official circles alike, all persons engaged in transport business imagined themselves threatened with ruin, and conservative patriots detected loss of national independence in a foreign loan. So fierce was the antagonism that the military authorities refused to permit operations of survey in the southern suburb of Tokyō, and the road had to be laid on an embankment constructed in the sea. Ito and Okuma, however, never flinched, and they were ably supported by Marquis M. Inouye and M. Mayeijima. The latter, published in 1870, the first Japanese work on railways, advocating the building of lines from Tokyō to the coast and from Tokyō to Osaka; the former, appointed superintendent of the lines, held the post for 30 years, and is justly spoken of as "the father of Japanese railways."

September 1872 saw the first official opening of a railway (the Tokyō-Yokohama line) in Japan, the ceremony being performed by the emperor himself, a measure which effectually silenced all further opposition. Eight years from the time of turning the first sod saw 71 m. of road open to traffic, the northern section being that between Tokyō and Shimbashi, and the southern that between Shimbashi and Kobe. A period of interruption now ensued, owing to domestic troubles and foreign complications, and when, in 1878, the government was able to devote attention once again to railway problems, it found that the expenditure of 100 million yen on the building of the line to be worth only about 3 million yen, and that a very large and costly foreign staff was employed on these roads in the early days, whereas no such item appeared in the accounts of private lines; that extensive works for the building of locomotives and rolling stock are connected with the government’s railways is quite certain; and that 53 million yen was spent in the first 15 years on roads in districts presenting exceptional engineering difficulties, such districts being naturally avoided by private companies. The gross earnings of all the lines during the fiscal year 1905-1906 were 7 million yen, while the expenditure (including the payment of interest on loans and debentures) were under 3 million yen, so that there remained a net profit of 33 million yen, being at the rate of a little over 8½% on the invested capital. The facts that the average cost of a mile of track was £200, that there were hardly any accidents or irregularities are not numerous, prove that Japanese management in this kind of enterprise is efficient.

When the fiscal year 1906-1907 opened, the number of private companies was no less than 376 m. of railway. To say that this represented an average of 91 m. per company is to convey an over-favourable idea, for, as a matter of fact, 15 of the companies averaged less than 3 miles of track, while another 31 had no track at all. The railroad companies had spent 415 million yen in 15 years, and 88 were left out of 4746 that had been started to the time. The total length of lines open for traffic at the end of March 1906 was 2476 m., 1470 m. having been built by the state and 3276 by private companies; the former at a cost of 16 millions sterling for construction and equipment, and the latter at a cost of 26 millions sterling. Thus the expenditure by the state averaged £10,884 per mile, and that by private companies, £7,631. This difference is explained by the facts that the state lines having been the pioneers, portions of the road have been sold to companies, and that the state has undertaken works of national importance, and has been defrayed by the public.

When the railroad companies were formed, the state had an average share of 25%, and the difference was paid out of the capital of the companies. Some of the interests in the lines, as a result of the nationalization scheme, have been transferred to the state. The original scheme included 15 other railways, with an aggregate mileage of only 335 m.; but these were eliminated as being lines of local interest only. The actual purchase price of the 17 lines was £38,000,000, or 15½ millions sterling (without double their interest), on the following basis: (a) An amount equal to 20 times the sum obtained by multiplying the cost of construction at the date of purchase by the average ratio of the profit to the cost of construction during the period of 10 years ending with the year to which the accounts apply, 1902 to the first half-year of 1905. (b) The amount of the actual cost of stored articles converted according to current prices thereof into public loan-bonds at face value, except in the case of articles purchased from the state. In the former case the government agreed to hand over the purchase money within 5 years from the date of the acquisition of the lines, in public loan-bonds bearing 5½ interest calculated at their face value; the bonds to be redeemed out of the net profits accruing from the purchased railways. It was agreed that the opportunity to exercise any option shall continue for 32 years, after which the annual profit accruing to the state from the lines would be 5½ millions sterling. But the nationalization scheme, though apparently the only effective means of increasing the revenue of the state, has proved a source of considerable financial embarrassment. For when the state constituted itself virtually the sole owner of railways, it necessarily assumed responsibility for extending them so that they should suffice to meet the wants of a nation numbering 35 millions. Such extension could be effected only by borrowing money. Now the government was pledged by the diet in 1907 to an expenditure of 11½ millions (spread over 8 years) for extending the old state system, and expenditure of over 1½ millions for improving them. But from the beginning of that year, a

1. In 1877 there were 120 English engineers, drivers and foremen in the service of the railway bureau. Three years later only three advisers remained.
period of extreme commercial and financial depression set in, and the treasury had to postpone all recourse to loans for whatever purpose, so that railway progress was completely checked in the first decades of the original and the acquired state lines. Moreover, all securities on which the share-depreciation was reflected on the balance was indicated by the change in the hands of the government. In these circumstances the government decided to take a strong step, namely, to place the whole of the railways owned by it—the original state lines as well as those nationalized in the years 1874 and 1875—under the general control of the treasury; to devote their entire profits to works of extension and improvement, supplementing the amount with loans from the treasury when necessary.

In the sequel of the war of 1904-5 Japan, with China's consent, acquired from Russia the lease of the portion of the South-Manchuria railway (see MANCHURIA) between Kwang-cheng-fsze (Chang-chun) on the north and Tairen (Dalny), Port Arthur and Nuschew on the south—a total length of 470 m. At the close of 1906 this road was handed over to a joint-stock company with a capital of 20 millions sterling, the government contributing 10 millions in the form of the road and its associated properties; the public subscribing 2 millions, and the company being entitled to issue debentures to the extent of 8 millions. The principal and interest of these debentures being officially guaranteed. Four millions worth of debentures were issued in London in 1877, at a premium, and the company's programmes not limited to operating the railway. It also works coal-halls at Yenki and Fushun; has a line of steamers plying between Tairen and Shanghai; and engages in enterprises of electricity, warehousing and insurance. In 1875 the government and the company fell in with the idea of building lines within zones 50 ft (17 m.), as far as possible, on either side of the line. The newest regulation guarantees 4% interest on the capital paid up by the general public.

Not until 1905 did Japan come into possession of an electric railway. It was a line of 8 m., built in Kiōto for the purposes of a domestic exhibition held in that city. Thenceforth this class of enterprise grew steadily in favour, so that, in 1907, there were 16 companies with an aggregate capital of 8 millions sterling, having 165 m. open to traffic and 177 m. under construction. Of these companies an aggregate capital of 3 millions had also obtained charters. The principal of these is the Tōkyō railway company, with a subscribed capital of 6 millions (31 paid up), 909 m. of line open and 149 m. under construction. In 1907 it carried 153 million passengers, and its net earnings were £500,000.

The traditional story of prehistoric Japan indicates that the first recorded emperor was an over-sea invader, whose followers must therefore have possessed some knowledge of ship-building and navigation. But in what kind of craft they sailed and how they handled them, there is nothing to show clearly. Nine centuries later, but still 500 years before the era of surviving written annals, an empress is said to have invaded Korea, embarking her forces at Kobe (then called Takakura) in 500 vessels. In the middle of the 6th century we read of a general named Abe-no-hirafu who led a flotilla up the Amur river to the invasion of Manchuria (called Shukushin). All these things show that the Japanese of the earliest era navigated the high sea with some skill, and at later dates down to medieval times they are found occasionally sending forces to Korea and constantly visiting China in vessels which seem to have experienced no difficulty in making the voyage. The 16th century was a period of maritime activity so marked that, had not artificial checks been applied, the Japanese, in all probability, would have obtained partial command of Far-Eastern waters. They invaded Korea; their corsairs harried the coasts of China; two hundred of their vessels, sailing under authority of the Taikō's vermilion seal, visited Siam, Luzon, Cochin China and Annam, and they built ships in European style which crossed the Pacific to Acapulco. But this spirit of adventure was chilled at the close of the 16th century and early in the 17th when contacts connected with the propagation of Christianity taught the Japanese to believe that national safety could not be secured without international isolation. In 1687 the ports were closed to all foreign ships except those flying the flag of Holland or of China, and a strictly enforced edict forbade the building of any vessel having a capacity of more than 500 koku (150 tons) or constructed for purposes of ocean navigation. Thenceforth, with rare exceptions, Japanese craft confined themselves to the coastwise trade. Ocean-going enterprise ceased altogether.

Things remained thus until the middle of the 19th century, when a growing knowledge of the conditions existing in the West warned the Tokugawa administration that continued isolation would be suicidal. In 1853 the law prohibiting the construction of sea-going ships was revoked and the Yedo government built at Uraga a sailing vessel of European type aptly called the "Phoenix" ("Howo Maru"). Just 243 years had elapsed since the founder of the Tokugawa dynasty constructed Japan's first ship after a foreign model, with the aid of an English pilot, Will Adams. In 1853 Commodore M. C. Perry made his appearance, and thenceforth everything conspired to push Japan along the new path. The Dutch, who had been proximately responsible for the adoption of the seclusion policy in the 17th century, now took a prominent part in promoting a liberal view. They sent to the Tokugawa a present of a man-of-war and urged the vital necessity of equipping the country with a navy. Then followed the establishment of a naval college at Tsukiji in Yedo, the building of iron-works at Nagasaki, and the construction at Yokosuka of a dockyard destined to become one of the greatest enterprises of its kind in the East. This has undertaken bore witness to the patriotism of the Tokugawa rulers, for they absolutely carried it to completion through the threes of a revolution which involved the downfall of their dynasty. Their encouragement of maritime enterprise had borne fruit, for when, in 1867, they restored the administration to the Imperial court, 44 ocean-going ships were found among their possessions and 94 were in the hands of the feudatories, a steamer and 20 sailing vessels having been constructed in Japan and the rest purchased abroad.

If the Tokugawa had been energetic in this respect, the new government was still more so. It caused the various maritime carriers to amalgamate into one association called the Nippon koku yubin jokisen (Mail SS. Company of Japan), to which were transferred, free of charge, the steamers, previously the property of the Tokugawa or the feudatories, and a substantial subsidy was granted by the state. This, the first steamship company ever organized in Japan, remained in existence only four years. Defective management and incapacity to compete with foreign-owned vessels plying between the open ports caused its downfall (1875). Already, however, an independent company had appeared upon the scene. Organized and controlled by a man (Iwasaki Yataro) of exceptional enterprise and business faculty, this mitsubishi kaisha (three lozenge company, so called from the design on its flag), working with steamers chartered from the former feudatory of Tosa, to which clan Iwasaki belonged, proved a success from the outset, and grew with each vicissitude of the state. For when (1874) the Meiji government's first complications with a foreign country necessitated the despatch of a military expedition to Formosa, the administration had to purchase 63 foreign steamers for transport purposes, and these were subsequently transferred to the mitsubishi company under the name of the vessels (17) hitherto in the possession of the Mail SS. Company. The Treasury further granting to the mitsubishi a subsidy of £50,000 annually. It was decided to purchase a service maintained by the Pacific Mail SS. Company with 4 steamers between Yokohama and Shanghai, and money for the purpose having been lent by the state to the mitsubishi, Japan's first line of steamers to a foreign country was firmly established, just 20 years after the law interdicting the construction of ocean-going vessels had been rescinded.

The next memorable event in this chapter of history occurred in 1877, when the Satsuma clan, eminently the most powerful and most warlike among all the former feudatories, took the field in open rebellion. For a time the fate of the government hung in the balance, but only by a flanking movement over-sea was the rebellion crushed. This strategy compelled the purchase of 10 foreign steamers, and these too were subsequently handed over to the mitsubishi company, which, in 1880, found itself possessed of 32 ships aggregating 75,600 tons, whereas the other vessels of foreign type in the country totalled only 27 with a tonnage of 6900. It had now become
apparent that the country could not hope to meet emergencies which might at any moment arise, especially in connexion with Korean affairs, unless the development of the mercantile marine proceeded more rapidly. Therefore in 1881 the formation of a new company was announced—the Kyōdō kaisha (Japan Steam Navigation Company)—and the government purchased half the shares. This was followed by the purchase of shares in several other private companies rather than to the state the duty of acquiring a fleet of vessels capable of serving as transports or auxiliary cruisers in time of war. But there was then seen the curious spectacle of two companies—Japanese and foreign—competing in the same waters and both subsidized by the treasury. After this had gone on for four years, the two companies were amalgamated (1885) into the Nippon yaen kaisha (Japan Mail SS. Company) for the purpose of working in harmony and at a fixed rate or the basis of 8% of the capital. Another company had come into existence a few months earlier. Its fleet consisted of 100 small steamers, totalling 10,000 tons, which had hitherto been competing in the Inland Sea.

Japan now possessed a substantial mercantile marine, the rate of whose development is indicated by the following figures:

<table>
<thead>
<tr>
<th>Year</th>

<td>1892</td>
<td>642</td>
<td>122,300</td>
<td>128,922</td>
</tr>
</tbody>
</table>

Nevertheless, only 23% of the exports and imports was transported in Japanese bottoms in 1892, whereas foreign steamers took 77%. This was in part due to the difficulty caused in the closing of the diet, but a bill presented by the government for encouraging navigation failed to obtain parliamentary consent, and in 1893 the Japan Mail SS. Company, without waiting for state assistance, opened a line to Bombay, which came to be worked in cooperation with the Nippon yaen kaisha. The first-class ships were now equipped with iron hulls, and the first of its vessels of 7,100 tons was launched in 1893. The year 1894 saw the building of 562,700 tons. In that year and in 1895 the figures were 651,160 and 835,894 tons respectively. In 1897, 1,041,666 tons were built.

In the building of iron and steel ships the Japanese are obliged to import much of the material used, but a large ship- foundry has been established under government auspices at Wakanatsu in Kyūshū. The construction of these vessels is now as noteworthy as the proximity to the Tāya iron mine in China, where the greater part of the iron ore used for the foundry is procured.

Simultaneously with the growth of the mercantile marine there has been a marked development of licensed mariners; that is to say, seamen registered by the government as having passed the examination prescribed by law.

In 1876 there were only four Japanese subjects who satisfied that definition as against 74 duly qualified foreigners holding responsible positions. In 1895 the numbers were 415 Japanese and 85 foreigners, and ten years later the corresponding figures were 16,886 and 349 respectively. In 1904 the ordinary seamen of the mercantile marine totalled 20,710.

There are in Japan various institutions where the theory and practice of navigation are taught. The principal of these is the Tōkyō shōsen gaikaku (Tōkyō mercantile marine college). Education of Mariners. In 1875, there were 500 of them, all being ex-officio seamen and being examined by spirits of members of the Japanese Admiralty. The course lasted two years, and equipped colleges exist also in seven other places, all having been established with official co-operation. Mention must be made of a mariners' association (kaishin kyūkai-kai) which has succoured about a hundred thousand seamen since its establishment in 1880.

The duty of overseeing all matters relating to the maritime carrying trade devolves on the department of state for communications, and is delegated by the latter to one of its bureaus (the Kaishin kyūkai-kyō, or ships superintendence bureau), which, again, is divided into three sections: Maritime Admistrators: one for inspecting vessels, one for examining mariners, and one for the general control of all shipping in Japanese waters. For the better discharge of its duties this bureau operates out of the empire into 4 districts, having their headquarters at Tōkyō, Osaka, Nagasaki and Hakodate; and these four districts are in turn subdivided into 18 sections, each having an office of maritime affairs (kaishin seikan).

Competition between Japanese and foreign ships in the carriage of the country's over-sea trade soon began to assume appreciable dimensions. Thus, whereas in 1891 the portion carried was only 11%, by 1911 it had increased to 39%. The prospect suggested by this record caused some uneasiness, which was not allayed by observing that while the tonnage of Japanese vessels in Chinese ports was only 2%
in 1896 as compared with foreign vessels, the former figure grew to 16% in 1902; while in Korean ports Japanese steamers almost monopolized the carrying trade, leaving only 18% to their foreign rivals, and even in Hong-Kong the tonnage of Japanese ships increased from 1% in 1896 to 13% in 1900. In 1898 Japan stood on the list of the thirteen principal maritime countries of the world, but in 1907 she rose to the fifth place. Her principal company, the Nippon yosen kaisha, though established as late as 1885, now ranks ninth in point of tonnage among the 21 leading maritime companies of the world. This company was able to supply 55 out of a total fleet of 207 transports furnished by all the steamship companies of Japan for military and naval purposes during the war with Russia in 1904-5. It may be noted in conclusion that the development of Japan's steam-shipping during the five decades ended 1907 was as follows:

</table>

There are also small numbers of Dutch, Peruvians, Belgians, Swiss, Italians, Danes, Swedes, Austrians, Hungarians, &c. This slow growth of the foreign residents is remarkable when contrasted with the fact that the volume of the country's foreign trade, which constitutes their main business, grew in the same period from 7% to 92 million yen.

**Posts and Telegraphs.**—The government of the Restoration did not wait for the complete abolition of feudalism before organizing a new system of posts in accordance with modern needs. At first, letters only were carried, but before the close of 1871 the service was extended so as to include newspapers, printed matter, books and commercial samples, while the area was extended so as to embrace all important towns between Hakodate in the northern island of Yezo and Nagasaki in the southern island of Kishū. Two years later this field was closed to private enterprise, the state assuming sole charge of the business. A few years later saw Japan in possession of an organization comparable in every respect with the systems existing in Europe. In 1892 a foreign service was added. Whereas in 1871 the number of post-offices throughout the empire was only 179, it had grown to 6,449 in 1907, while the mail matter sent during the latter year totalled 1,254 million (including 7,5 millions of parcels), and 67,000 persons were engaged in handling it. Japan labours under special difficulties for postal purposes, owing to the great number of islands included in the empire, the exceptionally mountainous nature of the country, and the wide areas covered by the cities in proportion to the number of their inhabitants. It is not surprising to find, therefore, that the means of distribution are varied. The state derives a net revenue of 5 million yen annually from its postal service. It need scarcely be added that the system of postal money-orders was developed pari passu with that of ordinary correspondence, but in this context one interesting fact may be noted, namely, that while Japan sends abroad only some £25,000 annually to foreign countries through the post, she receives over £450,000 from her over-sea emigrants.

Japan at the time of the Restoration (1867) was not entirely without experience which prepared her for the postal-money-order system. Some 600 years ago the idea of the bill of exchange was born in the little town of Totsugawa (Yamato province), though it did not obtain much development before the establishment of the Tokugawa shogunate in the 17th century. The feudal chiefs, having then to transmit large sums to Yedo for the purposes of their compulsory residence there, availed themselves of bills of exchange, and the shōgun's government, which received considerable amounts in Osaka, selected ten brokers to whom the duty of effecting the transfer of these funds was entrusted. Subsequently the 10 chosen brokers were permitted to extend their services to the general public, and a recent Japanese historian notes that Osaka thus became the birthplace of banking business in Japan. Postal money-orders were therefore easily appreciated at the time of their introduction in 1875. This was not true of the postal savings bank, however, an institution which came into existence in the same year. It was
altogether a novel idea that the public at large, especially the lower sections of it, should entrust their savings to the government for safe keeping, especially as the minimum and maximum deposited at one time were fixed at such petty sums as 10 sen (2fl.) and 30 sen (6fl.) respectively. In the first year, in which a total of £1500 was deposited in the first year must be regarded as notable. Subsequently deposits were taken in postage stamps, and arrangements were made for enabling depositors to pay money to distant classes of its public by means of a stamp, the amount of the nearest post office. In 1906 the number of depositors in the post savings banks was 8217, and their deposits exceeded to millions sterling. Thirteen per cent. of the deposits belong to agricultural classes, 1.2 to the commercial and only 6 to the industrial.

Rapid communication by means of beacons was not unknown in ancient Japan, but code-signalling by the aid of flags was not introduced until about the 17th century and was probably suggested by observation in the practice of foreign merchants. Its use, however, was peculiar. The central office stood at Osaka, between which city and many of the principal provincial towns rudely constructed towers were placed at long distances, and from one to and the central intelligence as to the market, 1.5 miles of rice was flashed by flag-shaking, the signals being read with telescopes. The Japanese saw a telegraph for the first time in 1854, when Commodore Perry presented a set of apparatus to the shogun, and for some years later the feudal chief of Satsuma (Shimazu Nariaki), caused wires to be erected within the enclosure of his castle. The true value of electric telegraphy was first demonstrated to the Japanese in connection with an insurrection in 1877, under the leadership of its principal towns. At that time, however, a line of telegraph had been put up between Tokyo and Yokohama (18 m.) and a code of regulations had been enacted. Suddenly introduced to such a mysterious product of foreign art, the people were turned from the ideas of a mission to the lower orders, and occasional attempts were made at the outset to wreck the wires. In 1886 the postal and telegraph offices were amalgamated and both systems underwent large development. When the length of the fourth end of the year after the introduction of the system was only 5 m., and the number of messages 20,000, these figures had grown in 1907 to 95,623 and 55,118 respectively. Several cables are included in these latter figures, among which that to the United States, was in 1889. Then telegraphy began to come into general use in 1898, when several vessels belonging to the principal steamship companies were equipped with the apparatus. It had, however, been employed for some years by private companies. During the latter half of the century, when the latter service was in little use, the invention of Captain Taniyama of the navy, Professor K. Kimura of the faculty of communication and Mr. M. Matsuishi of the department of communication, it seems. The telegraph service in Japan barely pays the cost of maintenance and capital replacement.

The introduction of the telegraph into Japan took place in 1877, but it served official purposes solely during 13 years, and even when it did. The introduction of telegraphy (1890) it was placed at the disposal of the government and its public utilities found a few few and small public purposes. But this apathy so yielded to a need of employer and the resources of the government (which monopolized the enterprise) proved inadequate to satisfy public demand. Automatic telephones were introduced, and set up in many large towns and along the main highways. The longest distance covered was from Tokyo to Osaka (348 m.). In 1907 Japan had 140,440 m. of telephone wires, 262 exchanges, 150 automatic telephone sets, and a total number of messages was 160 millions. The telephone service pays a net revenue of about £100,000 annually.

Agriculture.-The gross area of land in Japan—including Formosa and Sakhalin—is 89,167,880 acres, of which 35,487,022 acres are the property of the crown, the state and the communes, the rest (35,487,022 acres) being owned by private persons. Of the gross total the arable lands represent 35,301,297 acres. With regard to the immense expanse remaining unproductive, experts calculate that if all lands inclined at less than 3% be considered cultivable, an area of 10,643,574 acres remains to be reclaimed, though whether the result would repay the cost is a question utterly unanswered. The cultivated lands are thus classified, namely, paddy fields or rice lands, 6,871,437 acres; dry lands (or upland farms), 5,741,745 acres, and others, 2,688,115 acres.

Paddy fields are to be seen in every valley or dell where farming is practicable; they are divided into square, oblong or triangular plots by grass-grown ridges a few inches in height and on an average a foot in breadth—the rice being planted in the soft mud thus enclosed. Narrow passages intersect these rice-valleys at intervals, and rivulets (generally flowing between low banks covered with clumps of bamboo) feed ditches cut for purposes of irrigation. The fields are generally kept under water to a depth of a few inches while the crops are young, but are drained immediately before harvesting. They are then dug up, and again flooded before the second crop is planted out. The rising grounds which skirt the rice-land are filled by the hoe, and provide room for sugar-cane, millet and edible roots. The well-sloping slopes supply the peasants with timber and firewood. Thirty-six per cent. of the rice-fields yield two crops yearly. The seed is sown in beds, and the seedlings are planted out in the fields after attaining the height of about 8 in. The finest rice produced in the fertile plains watered by the Tonegawa in the province of Shimosa, but the grain of Kaga and of the two central provinces of Settsu and Harima is also very good.

Not only does the chief food of the Japanese but also the national beverage, called sake, is brewed from it. In colour the sake resembles very pale sherry; the taste is rather acid. None but the finest grain is used in its manufacture. Sake was of the land. The sake of rice is made from the best quality down shiro-sake or "white sake," and the turbid sort, drunk only in the poorer districts, known as nigor-i-sake; there is also a sweet sort, called mirin.

The various cereal and other crops cultivated in Japan, the areas devoted to them and the annual production are shown in the following table:

It is observable that no marked increase is taking place in cultivation, and that the business of growing cotton, hemp and indigo is gradually diminishing, these staples being supplied from abroad. Germany and Italy the annual additions made to the arable area average 6% whereas in Japan the figure is only 4%. Moreover, of the latter area the amount of for paddy fields is only 3% of 7% in the case of upland farms. This means that the population is rapidly outgrowing its supply of home-produced rates, the great foodstuff of the nation and the price of that cereals consequently shows a steady tendency to appreciate. Thus whereas the market value was 5s. 5d. per bushel in 1901, it rose to 65. 5d. in 1906.

Siliculicia, on the contrary, shows steady development by year. The demand of European and American markets has had a direct influence on the production of silk, but, although substantial, gains they can find an almost unrestricted sale in the West. The development from 1886 to 1906 was as follows:

The chief silk-producing prefectures in Japan, according to the order of production, are Nagano, Gunma, Yamanashi, Aichi and Shizuoka. At the close of 1906 there were 5843 factories throughout the country, and the number of families engaged in sericulture was 397,885.

Lacquer, vegetable wax and tobacco are also important staples of production. The figures for the ten-year period, 1897 to 1906, are as follows:

While the quantity of certain products increases, the number of flatteries remains, as the inference being the flatteries are coming to be conducted on a larger scale than was formerly the case. Thus in sequence the flatteries diminished from 4724 in 1897 to 3843 in 1906, the number of lacquer factories from 1637 to 1123 on the same dates, and the number of wax factories from 2619 to 1979. It is generally said that whereas more than 60% of Japan's entire population is engaged in agriculture, she remains far behind some of the civilised countries in the production of scientific principles to farming. Nevertheless if we take for unit the average value of the yield per hectare in Italy, we obtain the following figures:

In the realm of agriculture, as in all departments of modern Japan's material development, abundant traces are found of official activity. Thus, in the year 1900, the government enacted laws designed to correct the excessive subdivision of farmers' holdings; to unite them in larger plots; to facilitate irrigation; to promote the use of machinery; to make known the value of artificial fertilizers; to conserve streams and to prevent inundations. Further, in order to assist the capital for the purchase of farm implements and commercial banks—one in each prefecture—were established with a central institution called the hypotek bank which assists them to collect funds. A Hokkaido colonial bank and subsequently a bank of Formosa were also organized, and a law framed to encourage the formation of co-operative societies which should develop a system of credit, assist the business of sale and purchase and concentrate small capitals. Experimental stations were also established for the promotion of dairying and stock-breeding, the use of implements, the manufacture of agricultural products and cognate matters. Encouragement by grants was also given to the establishment of extensive experimental farms by private persons in the various prefectures, and such farms are now to be found everywhere. This official initiative, with equally successful results, extended to the domain of sericulture and tea-growing. There are two state sericultural training institutions where not only the rearing of silkworms and the management of flatteries are taught, but also experiments are made; and these institutions, like the state agricultural stations, have served as models for the establishment of seven more experiment stations, some of which are devoted to the rearing of silkworms in conditioning house at Yokohama; experimental tea-farms; laws to prevent and remove diseases of plants, cereals, silkworms and cattle, and regulations to check dishonesty in the matter of fertilizers and seeds. The government has also taken active steps to encourage the establishment of official efforts in the realm of agriculture during the Meiji era.

One of the problems of modern Japan is the supply of cattle. With a rapidly growing taste for beef—which, in former days, was called the food of cow—in the former days, was called the food of cow—brisk demand for timber has already begun to increase.

Stock-breeding. Diminution in the stock of cattle. Thus while the number of the latter in 1897 was 1,214,153, out of which total 15,534 were slaughtered, the corresponding figures in 1906 were 1,490,373 and 167,488, respectively. The stock of sheep (350 in 1900) decreases slowly, and the stocks of goats (86,494 in 1897 and 74,750 in 1906) increase slowly. The mixed breeds are not a success, and the war with Russia in 1904, has shown clearly the need of horses for artillery and cavalry purposes. Large imports of Australian, American and European cattle are now made, and the organization of race-clubs has been encouraged throughout the country.

The mixed breed occupy a area of 35 million acres, or 60% of the total area of Japan, and the third of it has expanded, namely, 18 million acres, is the property of the state. It cannot be said that any practical attempt has yet been made to develop this source of wealth. The receipts from forests stood at 80,000,000 yen (ten thousand) in the last 1868, to 500,000,000 yen in 1897, and to 800,000,000 yen at the end of 1906. The present figure compares favourably with the revenue of only 3 millions derived from the same source in the fiscal year 1904-1905. This failure to utilize a valuable asset is chiefly due to defective communications, but the demand for timber has already begun to increase.

In 1907 a revised forestry law was promulgated, according to which the administration is competent to prevent the destruction of forests and to cause the planting of plains and waste-lands, or the re-planting of denuded areas. A plan was also elaborated for systematically turning the state forests to valuable account, while, at the same time, providing for their conservation.

**Fisheries.**—From ancient times the Japanese have been great fishermen, and to the sea they have added abundant freshwater resources. The fishermen are engaged in trawling and in deep-sea fishing with fish and aquatic products, which have always constituted an essential article of diet. Early in the 18th century, the Tokugawa administration, in pursuance of a policy of isolation, interdicted the landing of foreign vessels and the importation of goods. Thus in the latter part of the 18th century the art of deep-sea fishing suffered a severe check. But shortly after the Restoration in 1867, not only was this veto rescinded, but also the government, organizing a marine bureau and a marine products association under the presidency of an imperial prince. Fisheries training schools were the next step; then periodical exhibitions of marine products, and lastly marine products association, were formed. Among the principal islands engaged in the rearing of fish is Meiji island, and the sea of Oshika. There are 5000 fishermen with 2000 boats, and 4000 of them constitute a tribe of diet. Among manufactured aquatic products the chief are in the order of their importance: bonito (katsu), sardines (isawashi), cuttle-fish (tako), squid (tsuk), mackerel (sabu), yellow tail (baru), tunny-fish (maguro), prawns (ebi), sole (hako), grey mullet (tobi), sardine (tokei). Altogether 700 kinds of aquatic products are known in Japan, and 400 of them constitute a tribe of diet. Among manufactured aquatic products the chief are the order of their importance: dried bonito, sashimi, dried cuttle-fish, dried and boiled sardines, dried herring and dried prawns. The export of marine products amounted to £900,000 in 1896 against £400,000 ten years previously.

Minerals. Crystalline schists form the axis of Japan. They run in a direct direction from south-west to north-east, with chains starting east and west from Shikoku. On these schists rocks of every age are superimposed, and amid these somewhat complicated geological conditions numerous minerals occur. Precious stones, however, are not found, though crystals of quartz and antimony as well as good specimens of topaz and agate are not infrequent. The principal metals of which Japan is rich are silver, copper, iron, and zinc. The demand for coal is considerable, and in the year 1896, the coal mines took 37,000 tons annually, and Japan is obliged to import from the neighbouring continent the greater part of the iron needed by her factories. The iron, coal, and copper are the principal minerals of Japan.

The value of the silver mined is approximately equal to that of the gold. It is found chiefly in volcanic rocks (especially in the form of sulphide), and is usually associated with gold. Silver is very abundant, and is found in crystalline schists or paleozoic sedimentary rocks, but the richest deposits of silver in Japan are found in tertiary rocks extend from Ye to Fosmura, and the principal are in Echigo, which yields the greater part of the silver now obtained in Japan. The oil-bearing strata extend from Ye to Fosmura, but the principal are in Echigo, which yields the greater part of the silver now obtained, the Ye and Fosmura wells are often referred to as the 'Ye-Fosmura wells.'
being still exulted. The quantity of petroleum obtained in Japan in 1897 was 9 million gallons, whereas the quantity obtained in 1906 was 55 million.

Japanese mining enterprise was more than trebled during the decade 1897-1906, for the value of the minerals taken out in the former year was only 33 million sterling, whereas the corresponding figure for 1906 was 11 million. The earliest mention of gold-mining in Japan takes us back to the year A.D. 696, and by the 16th century the country had acquired the reputation of being rich in gold. During the days of her medieval intercourse with the outer world, her stores of the precious metals were largely reduced, for between the years 1602 and 1766, Holland, Spain, Portugal and China took from her 313,800 l (troy) of gold and 11,230,000 l of silver.

Copper occupied a scarcely less important place in Old Japan. From a period long anterior to historic times this metal was employed to manufacture mirrors and swords, and the introduction of Buddhism in the 6th century was quickly followed by the casting of sacred images, many of which still survive. Finding in the 18th century that her foreign intercourse not only had largely denuded her of gold and silver, but also threatened to denude her of copper, Japan set a limit (in 1790) to the yearly export of the latter metal. After the resumption of administrative power by the emperor in 1867, attention was quickly directed to the question of mineral resources; several Western experts, were employed to conduct surveys and introduce Occidental mining methods, and soon the most important mines were worked under the direct auspices of the state in order to serve as object lessons. Subsequently these mines were all transferred to private hands, and the government now retains possession only of a few iron and coal mines, and these products are needed for dockyard and arsenal purposes. The following table shows the recent progress and present condition of mining industry in Japan:

The number of mine employees in 1907 was 190,000, in round numbers: the number of mining companies, 189; and the aggregate paid-up capital, 10 million sterling.

**Industries:**—In the beginning of the Meiji era Japan was practically without any manufacturing industries, as the term is understood in the Occident, and she had not so much as one joint-stock company. At this time, 1868, her joint-stock companies and partnerships totalled 932, their paid-up capital exceeded 100 million sterling, and their reserves totalled 26 million. It is not to be inferred, however, from the absence of manufacturing organizations 50 years ago that such pursuits were deliberately eschewed or despised in Japan. On the contrary, at the very dawn of the historical epoch we find that sections of the people took their names from the work carried on by them, and that specimens of expert industry were preserved in the sovereign's palace side by side with the imperial insignia. Further, skilled artisans from the neighbouring continent always found a welcome in Japan, and when Korea was successfully invaded in early times, one of the uses which the victors made of their conquest was to import Korean weavers and dyers. Subsequently the advent of Buddhism, with its demand for images, temples, gorgeous vestments and rich paraphernalia, gave a marked impulse to the development of artistic industry, which at the outset took its models from China, India and Greece, but gradually, while assimilating many of the best features of the continental schools, subjected them to such great modifications in accordance with Japanese genius that they ceased to retain more than a trace of their originals. From the 9th century luxurious habits prevailed in Kiôto under the sway of the Fujiwara regents, and the imperial city's munificent patronage drew to its precincts a crowd of artisans. But these were not industrials, in the Western sense of the term, and, further, their organization was essentially domestic, each family selecting its own pursuit and following it from generation to generation without co-operation or partnership with any outsider. The establishment of military feudalism in the 12th century brought a reaction from the effeminate luxury of the metropolis, and during nearly 300 years no industry enjoyed large popularity except that of the armorer and the sword-smith. No sooner, however, did the prowess of Oda Nobunaga and, above all, of Hideyoshi, the taikô, bring within sight a cessation of civil war and the unification of the country, than the taste for beautiful objects and artistic utensils recovered vitality. By degrees there grew up among the feudal barons a keen rivalry in art industry, and the shôgun's court in Yedo set a standard which the feudatories constantly strove to attain. Ultimately, in the days immediately preceding its fall, the shôgun's administration sought to induce a more logical system by encouraging local manufacturers to supply local needs only, leaving to Kiôto and Yedo the duty of catering to general wants.

But before this reform had approached maturity, the second advent of Western nations introduced to Japan the products of an industrial civilization in advance of her own from the point of view of utility, though noisier in the application of art. Immediately the nation became alive to the necessity of correcting its own inferiority in this respect. But the people being entirely without models for organization, without financial machinery and without the idea of joint stock enterprise, the government had to choose between entering the field as an instructor, and leaving the nation to struggle along an arduous and expensive way to tardy development. There could be no question as to which course would conduct more to the general advantage, and thus, in days immediately subsequent to the resumption of administrative power by the emperor, the spectacle was seen of official excursions into the domains of silk-reeling, cement-making, cotton and silk spinning, brick-burning, printing and book-binding, soap-boiling, type-casting and ceramic decoration, to say nothing of their establishing colleges and schools where all branches of applied science were taught. Domestic exhibitions also were organized, and specimens of the country's products and manufactures were sent under government auspices to exhibitions abroad. On the other hand, the effect of this new departure along Western lines could not but be injurious to the old domestic industries of the country, especially to those which owed their existence to tastes and traditions now regarded as obsolete. Here again the government came to the rescue by establishing a firm whose functions were to familiarize foreign markets with the products of Japanese artisans, and to instruct the latter in adaptations likely to appeal to Occidental taste. Steps were also taken for training women as artisans, and the government printing bureau set the example of employing female labour, an innovation which soon developed large dimensions. In short, the authorities applied themselves to educate an industrial disposition throughout the country, and as soon as success seemed to be in sight, they gradually transferred from official to private direction the various model enterprises, retaining only such as were required to supply the needs of the state.

The result of all this effort was that whereas, in the beginning of the Meiji era, Japan had virtually no industries worthy of the name, she possessed in 1896—that is to say, after an interval of 25 years
America. Japan seems to have one great advantage over Occidental countries: she possesses an abundance of dexterous and exceptionally cheap labour. It has been said, indeed, that this latter advantage is not likely to be permanent, since the wages of labour and the cost of living are fast increasing. The average cost of living doubled in the interval between 1895 and 1906, but, on the other hand, the number of manufacturing organizations doubled in the same time, while the amount of their paid-up capital nearly trebled. As to the number of life, if those temporarily affected by the new monopolies be excluded, the rate of appreciation between 1900 and 1906 averaged about 30%, and it thus appears that the cost of living is not increasing with the same rapidity as the remuneration earned by labour. The manufacturing progress of the nation seems, therefore, to have a bright future, the only serious impediment being deficient capital. There is abundance of coal, and steps have been taken on a large scale to utilize the many excellent opportunities which the country offers for developing electricity by water-power.

The fact that Japan's exports of raw silk amounted to more than 12 millions sterling, while she sends over-sea only 3½ millions' worth of silk fabrics, suggests some marked inferiority in Silk on the part of her weavers. But the true explanation seems to be that her domestic industry is not in catering for the changing fashions of the West. There cannot be any doubt that the skill of Japanese weavers was at one time eminent. The sun goddess herself, the predominant figure in Japan, saw this; and, throughout the ages, the Japanese weavers were so famous as to be a part of the national mythology. The names of the four varieties of woven fabrics were known in prehistoric times; the 3rd century of the Christian era saw the arrival of a Korean maker of cloth; after him came an influx of Chinese who were distributed into the various arts of silk and sea-waving; a sovereign (Yuriaku) of the 7th century employed 92 groups of naturalized Chinese for similar purposes; in 421 the same emperor issued a decree encouraging the culture of the new material, and calling for cotton; the manufacture of textiles was directly supervised by the consort of this sovereign; in 645 a bureau of weaving was established; many other evidences are conclusive as to the great antiquity of the art of silk and cotton weaving.

The coming of Buddhism in the 6th century contributed not a little to the development of the art, since not only did the priests require for their own vestments and for the decoration of temples silken fabrics of more and more gorgeous description, but also these holy men themselves, careful always to keep touch with the developmental developments of their faith, made frequent voyages to China, whence they brought back to Japan a knowledge of whatever technical or artistic improvements the Middle Kingdom could show. While Korea had become the permanent metropolis of the East, at the close of the 8th century, a bureau was established for weaving brocades and rich silk stuffs to be used in the palace. This predated an era of some three centuries of steadily developing luxury in Kioto; an era when an essential part of every aristocratic furni-

The existing paper is of myriads of years. In Japan, the government had during the Tokugawa administration the command of a large army, and the Momoyama (end of the 16th century) are reproduced.

It would be possible to draw up a formidable catalogue of the various kinds of silk fabrics manufactured in Japan before the opening of her ports. The vogue of the Western art-directed by new impulse from contact with the Occident, Machinery has been largely introduced, and though the products of hand-loom are not equal in beauty, they are possessed of a rich diversity of tint. During the long era of peace under the Tokugawa administration the culture of silkworms was maintained, and when the Tokugawa era came to an end, the momoyama (end of the 16th century) are reproduced.

Commerce in Tokugawa Times.—The conditions existing in Japan during the two hundred and fifty years preatory to the modern opening of the country were unfavourable to the development alike of national and of international trade. As to the former, the system of feudal government exercised a crippling influence, for each feudal chief endeavoured to check the export of any kind of property from his fief, and free interchange of

The manufacture of textiles was directly supervised by the consort of this sovereign; in 645 a bureau of weaving was established; many other evidences are conclusive as to the great antiquity of the art of silk and cotton weaving.

In the field of what may be called minor manufactures—such as ceramic wares, lacquers, straw-plaits, &c.—there has been corresponding growth, for the value of these productions increased from 1 million sterling in 1897 to 3½ millions in 1906. But as these manufactures do not enter into competition with foreign goods in either Eastern or Western markets, they are interesting only as showing the development of Japan's producing power. They contribute nothing to the solution of the problem whether Japanese industries are destined ultimately to drive their foreign rivals from the markets of Asia, if not to compete injuriously with them even in Europe and

The existing paper is of myriads of years. In Japan, the government had during the Tokugawa administration the command of a large army, and the Momoyama (end of the 16th century) are reproduced.

It would be possible to draw up a formidable catalogue of the various kinds of silk fabrics manufactured in Japan before the opening of her ports. The vogue of the Western art-directed by new impulses from contact with the Occident, Machinery has been largely introduced, and though the products of hand-loom are not equal in beauty, they are possessed of a rich diversity of tint. During the long era of peace under the Tokugawa administration the culture of silkworms was maintained, and when the Tokugawa era came to an end, the momoyama (end of the 16th century) are reproduced.
commodities was thus prevented so effectively that cases are recorded of one feudalism's subjects dying of starvation while those of an adjoining tribe enjoyed abundance. International commerce, on the other hand, lay under the veto of the government, which punished with death anyone attempting to hold intercourse with foreigners. Thus the fiefs practised a policy of mutual seclusion at home, and united to maintain a policy of general seclusion abroad. Yet it was under the feudal system that the most signal development of Japanese trade took place, and since the processes of that development have much historical interest they invite close attention.

As the bulk of a feudal chief's income was paid in rice, arrangements had to be made for sending the grain to market and transmitting its proceeds. This was effected originally by establishing in Osaka stores (kurayashiki), under the charge of samurai, who received the rice, sold it to merchants in that city and remitted the proceeds by railcarriages to Tokyo. In the 17th century these stores were placed in the charge of tradesmen to whom was given the name of kake-ya (agent). They disposed of the products entrusted to them by a fiel and held the money, sending it by railcarriages to the vaults at the rate of from 2 to 4%.

The had no special licence, but they were honourably regarded and often distinguished by an official title or an hereditary pension. In fact, the yashiki, as they were called, were instances of the great families, was, in effect, a banker charged with the finances of several barons. In Osaka the method of sale was uniform. Tenders were invited, and these having been opened in the presence of all the store officials and merchants of the city, the rice was sold per ton, the money, paying the remainder within ten days, and thereafter becoming entitled to take delivery of the rice in whole or by installments within a certain time, no fee being charged for storage. A similar system of deferred delivery developed the establishment of exchanges where advances were made against sale certificates, and purely speculative transactions came into vogue. There followed an experience common enough in the West at a similar public occasion, where the hopes in the market on the ground that they tended to enhance the price of rice. Several of the brokers were arrested and brought to trial; marginal dealings were henceforth forbidden, and a system of licences was inaugurated in Yedo, the number of licences being restricted to 100.

The system of organized trading companies had its origin in the 17th century, when, the number of merchants admitted within the confines of Yedo being restricted, it became necessary for those not obtaining that privilege to establish some form of corporation, and there resulted the formation of companies with representatives stationed in the feudal capital and share-holding members in the provinces. The Ashikaga shōguns developed this restriction by selling the title of merchant to rubber traders in various particular trade, and the Tokugawa administration had recourse to the same practice. But whereas the monopolies instituted by the Ashikaga had for sole object the enrichment of the exchequer, the shōgun of the Tokugawa days placed the title of merchant in representatives in each branch of trade. The first licences were issued in Yedo to keepers of bath-houses in the middle of the 17th century. As the city grew in dimensions these licences increased in value, so that the wholesalers would accept them in pledge for loans. Subsequently almond-sellers were obliged to take licences, and the system was afterwards extended to money-changers.

Another obstacle to the fishmongers, however, that the advantages of commercial organization first presented themselves vividly. The greatest fish-market in Japan is at Nihon-bashi in Tōkyō (formerly Yedo). It had its origin in the needs of the Tokugawa court. When Ieyasu (founder of the Tokugawa dynasty) entered Yedo in 1603 he wished to establish such a market, whom he granted the privilege of plying their trade in the adjacent seas, on condition that they furnished a supply of their best fish for the use of the garrison. The remainder they offered for sale at Nihon-bashi. After the establishment of the Sera (Yamato province hence called Yama-ya) went to Yedo and organized the fishmongers into a great guild. Nothing is recorded about this man's antecedents, though his mercantile genius entitles him to historical attention. Under the protection of his lord, the shōgun, he regulated the trade in the neighbouring seas, advanced money to the fishmongers on the security of their catch, constructed preserves for keeping the fish alive until they were exposed in the market, and enrolled all the dealers under his control. He allowed the fishmongers to keep 246 brokers. The main purpose of Sukegoro's system was to prevent the consumer from dealing direct with the producer. Thus in return for the pecuniary accommodation granted to fishermen to buy boats and nets they were required to give every fish they caught to the wholesale merchant from whom they had received the advance; and the latter, on his side, had to sell in the open market at prices fixed by the confederation. A similar type of corporation was applied to vegetables, though in this case the monopoly was never so close.

It will be observed that this federation of fishmongers approximated closely to a trust, as the term is now understood; that is to say, an organization of merchants who combine as a business firm to control trade and pledged to observe certain rules in the conduct of their business as well as to adhere to fixed rates. The idea was extended to nearly every trade, 10 monster confederations being organized in Yedo and 24 in Osaka. These received official recognition, and every seller and buyer of the same kind was required to join a confederation bearing a name like "benefit money," amounting to nearly $20,000 annually. They attained a high state of prosperity, the whole of the cities' supplies passing through their hands. No member of a confederation was permitted to deal with anyone not a member of the relative confederation, and if anyone not on the roll of a confederation engaged in the same business he became liable to punishment at the hands of the officials.

In spite of the limits thus imposed on the transfer of licences, one of them in the case of the sugar business, and the fees charged in the beginning of the 17th century the confederations, or guilds, had increased to 68 in Yedo, comprising 1195 merchants. The guild system extended to maritime enterprise also. In the beginning of the 17th century Yedo was a small town with a population of 10,000, and in the 18th century the government was told to pay a tax of $10,800 as a substitute for rice. By 1710 the capital of the country was bustling with 10,000 people. The growth and organization of the customary jinsha, or rice-futures market, had taken place, but the price of rice was fixed by the government. The rice-market was under the control of the central government, and the rice was bought and sold in fixed quantities by the central government. The rice was sold to the citizens of the city, and the rice was sold to the citizens of the city. The rice was sold to the citizens of the city, and the rice was sold to the citizens of the city. The rice was sold to the citizens of the city, and the rice was sold to the citizens of the city. The rice was sold to the citizens of the city, and the rice was sold to the citizens of the city. chiefs was carried to Yedo by pack-horses and couriers of the regular postal service. But the costliness of such a method led to the selection in 1691 of 10 exchange agents who were appointed bankers to the Tokugawa government and were required to furnish money within 30 days of receipt of each shipment of foreign goods and repaid with interest by the name of the "ten-men gild." Subsequently the firm of Mitsui was added, but it enjoyed the special privilege of being allowed 150 days to collect a specified amount. The gild received moneys on account of the Tokugawa government from the foreign merchants at private centres, and then made its own arrangements for cashing the cheques drawn upon it by the shōgun or the daimyō in Yedo. If coin happened to be immediately available, it was employed to cash the documents. The Tokugawa government availed itself of the services of the surrounding sibas, but also they became depositories of the proceeds, which they paid out on account of the owners in whatever sums the latter desired. Such an evidence of official confidence greatly strengthened their credit, and they received further encouragement of such ends from Mito and from Ishimaru Sadatsugu, governor of the city in 1661. He fostered wholesale transactions, sought to introduce a large element of credit into commerce by instituting a system of credit sales; took measures to provide a system of checks against the granting of credit, and by making gold and silver and appointed ten chiefs of exchange who were empowered to oversee the business of money-exchanging in general. These ten received exemption from municipal taxation and were permitted to authorize their gild, whose members agreed to honour one another's vouchers and mutually to facilitate business. Gradually they elaborated a regular system of banking, so that, in the middle of the 18th century, they issued notes at an interest of 21 per cent. These were taken at face value in certain places within fixed periods; deposit notes redeemable on the demand of an indicated person or his order; bills of exchange drawn by A upon B in favour of C (a common form for use in money-lending transactions). The notes were recognized by the merchants in future time, or cheques payable at sight, for goods purchased; and storage orders engaging to deliver goods on account of which earnest money had been paid. These last, much employed in transactions relating to goods to arrive by ships, were granted for 6 months, 9 months, and 3 months, were signed by a confederation of exchanges or merchants on joint responsibility, and guaranteed the delivery of the indicated merchandise independently of all accidents. They passed on from firm to firm as credit, and advances could always be obtained against them from pawnbrokers.

All these documents, indicating a well-developed system of credit, were duly protected by law, severe penalties being inflicted for any failure to implement the pledges they embodied. The merchants of Yedo and Osaka, working on the system of trusts here described, gradually acquired great wealth and fell into habits of marked luxury. It is recorded that they did not hesitate to pay 300 for the first battalion of tea; 20 guineas for the first fruit-egg. Naturally the spectacle of such extravagance caused much comment. Men began to grumble against the so-called "official merchants" who, under government auspices, monopolized every branch of trade; and this feeling grew almost uncontrollable in 1836, when they were subjected to an unprecedented price owing to crop failures. The celebrated Fujiya Toko of Mito took up the question. He argued that the monopoly system, since it included Osaka, exposed the Yedo market to all the vicissitudes of the former city, which had then lost its costliness of currency.

Finally, in 1841, the shōgun's chief minister, Mizuno Echizen-no-Kami, withdrew all trading licences, dissolved the gilds and proclaimed that everyone should thenceforth be free to engage in any trade he chose or to set up and run a business. This was a great measure, vividly illustrating the arbitrariness of feudal officialdom, not only included the commercial gilds, the shipping gilds, the exchange gilds and the land transport gilds, but also was carried to the extent of interfering with the activities of the many companies dealing in foreign trade. The authorities further declared that in times of scarcity wholesale transactions must be abandoned altogether and retail business alone carried on, their purpose being to bring retail and wholesale prices into line, but also to provide for the needs of fishermen or to producers in the provincial districts was interdicted; even the fuda-sashi might no longer ply their calling, and neither bath-house keepers nor hairdressers were allowed to combine for the purpose of being admitted to the shōgun's service. All such judged interference produced evils greater than those it was intended to remedy. The gilds had not really been exacting. Their organization had reduced the cost of distribution, and they had provided facilities of transport which brought produce within quick and cheap reach of the central market.

Ten years' experience showed that a modified form of the old system would conduce to public interests. The gilds were re-established, licence fees, however, being abolished, and no limit set to the number of firms in a gild. Things remained thus until the beginning of the Meiji era (1867), when the gilds shared the cataclysm that overtook all the country's old institutions. Japanese commercial and industrial life presents another feature which seems to suggest special aptitude for combination. In mercantile or manufacturing families, while the eldest son always succeeded to his father's business, not only the younger sons but also the apprentices, employees, after they had served faithfully for a number of years, expected to be set up as branch houses under the auspices of the principal family, receiving a place of business, a certain amount of capital and the privilege of using the original house-name. Many of these small-established firms thus came to have aplexus of branches all serving to extend its business and strengthen its credit, so that the group held a commanding position in the business world. It will be apparent from the above that commercial transactions on a large scale were handled by the Tokugawa shogun, by the confederation of Yedo and Osaka, the people in the provincial cities having no direct association with the gild system, confining themselves, for the most part, to domestic industries on any scale beyond the boundaries of the feil to which they belonged.

Foreign Commerce during the Meiji Era.—If Japan's industrial development in modern times has been remarkable, the same may be said even more emphatically about the development of her over-sea commerce. This was checked at first not only by the unpopularity attaching to all intercourse with outside nations, but also by embarrassments resulting from the difference between the old silver coinage and the gold coinage of Europe, the precious metals being connected in Japan by a ratio of 1 to 8, and in Europe by a ratio of 1 to 15. This latter fact was the cause of a sudden and violent appreciation of values; for the government, seeing the country threatened with loss of all its gold, tried to avert the catastrophe by altering and reducing the weights of the silver coins without altering their denominations, and a corresponding difference exhibited itself, as a matter of course, in the silver quotations of commodities. Another difficulty was the attitude of officialdom. During several centuries Japan's over-sea trade had been under the control of officialdom, to whose coffers it contributed a substantial revenue. But when the foreign exporter entered the field under the conditions created by the new system, he diverted to his own pocket the handsome profit previously accruing to the government; and since the latter could not easily become reconciled to this loss of revenue, or even itself from its traditional habit of interference in affairs of foreign commerce, and since the foreigner, on his side, was not eager to copy the example of others in adopting the cheaper method of barter, the state of affairs was bound to be a case of mutual distrust and mutual ill will; and was but a sorry foreboding of Oriental espionage, not a little friction occurred from time to time. Thus the scanty records of that early epoch suggest that trade was beset with great difficulties, and that the foreigner had to contend against most adverse circumstances, though in truth his gains amounted to 40 or 50%.

The chief staples of the early trade were tea and silk. It happened that just before Japan's raw silk became available for export, the production of that article in France and Italy had been largely curtailed owing to a novel disease of the silkworm. Thus, when the first bales of Japanese silk appeared in London, and when it was found to possess qualities entitling it to the highest rank, a keen demand sprang up. Japanese green tea also, differing radically in flavour and bouquet from the black tea of China, appealed quickly to American taste, so that by the year 1807 Japan found herself selling to foreign countries tea to the extent of 11 millions sterling. This remarkable development is typical of the general history of Japan's foreign trade in modern times. Omitting the first decade and a half, the statistics for which are imperfect, the volume of the trade grew from 5 millions sterling in 1873–3 shillings per head of the population—to 93 millions in 1907—or 38 shillings per head. It was not a uniform growth. The period of 35 years divides itself conspicuously into two eras: the first, of 15 years (1873–1887), during which the development was from 5 millions to 9.7 millions, a ratio of 1 to 2, approximately; the second, of 20 years (1887–1907), during which the development was from 9.7 millions to 93 millions, a ratio of 1 to 10.
That a commerce which scarcely doubled itself in the first fifteen years should have grown nearly tenfold in the next twenty is a fact inviting attention. There are two principal causes: one general, the other special. The general cause was that several years necessarily elapsed before the nation's material condition began to respond perceptibly to the improvements effected by the Meiji government in matters of administration, taxation and transport facilities. Fiscal burdens had been reduced and security of life and property obtained, but railway building and road-making, harbour construction, the growth of posts, telegraphs, exchanges and banks, and the development of a mercantile marine did not exercise a sensible influence on the nation's prosperity until 1884 or 1885. From that time the country entered a period of steadily growing prosperity, and from that time private enterprise may be said to have finally started upon a career of independent activity. The special cause which, from 1885, contributed to a marked growth of trade was the resumption of specie payments. Up to that time the treasury's fiat notes had suffered such marked fluctuations of specie value that sound or successful commerce became very difficult. Against the importers merchant the currency trouble worked with double potency. Not only did the gold with which he purchased goods appreciate constantly in terms of the silver for which he sold them, but the silver itself appreciated sharply and rapidly in terms of the fiat notes paid by Japanese consumers. Cursory reflection may suggest that these factors should have stimulated exports as much as they depressed imports. But such was not altogether the case in practice. For the exporter's transactions were hampered by the possibility that a delay of a week or even a day might increase the purchasing power of his silver in Japanese markets by bringing about a further depreciation of paper, so that he worked timidly and hesitatingly, dividing his operations as minutely as possible in order to take advantage of the downward tendency of the fiat notes. Not till this element of pernicious disturbance was removed did the trade recover a healthy tone and grow so lustily as to tread closely on the heels of the foreign commerce of China, with its 300 million inhabitants and long-established international relations.

Japan's trade with the outer world was built up chiefly by the energy and enterprise of the foreign middleman. He acted the role of the Foreign Middleman, his command of cheap capital, his experience, his knowledge of foreign markets, and his connexions enabled him to secure sales such as must have been beyond reach of the Japanese working independently. Moreover, he paid to native consumers ready cash for their staples, taking upon his own shoulders the risks of finding markets abroad. As an importer, he enjoyed, in centres of supply, credit which the Japanese lacked, and he offered to native consumers foreign produce brought to their doors with a minimum of responsibility on their part. Finally, whether as exporters or importers, foreign middlemen always competed with each other so keenly that their Japanese clients obtained the best possible terms from them. Yet the ambition of the Japanese to oust them cannot be regarded as unnatural. Every nation must desire to carry on its own commerce independently and not be dependent upon alien middlemen; the foreign middleman's residence in many years within Japanese territory, but without the pale of Japanese sovereignty, invested him with an aggressive character which the anti-Oriental exclusiveness of certain Occidental nations helped to accentuate. Thus from the point of view of the average Japanese there are several reasons for wishing to dispense with alien middlemen, and it is plain that these reasons are operative; for whereas, in 1888, native merchants carried on only 12% of the country's over-sea trade without the intervention of the foreign middlemen, their share rose to 35% in 1899 and has since been slowly increasing.

Analysis of Japan's foreign trade during the Meiji era shows that during the 35-year period ending in 1907, imports exceeded exports in 21 years and exports exceeded imports in 14 years. This does not suggest a very badly balanced trade. But closer examination accentuates the difference, for when the figures are added, it is found that the excesses of exports aggregated only 11 millions sterling, whereas the excesses of imports totalled 71 millions, there being thus a so-called "unfavourable balance" of 60 millions over all. The movements of specie do not throw much light upon this subject: and they were small. Large imports of gold resulting from war indemnities and foreign loans. Undoubtedly the balance is materially redressed by the expenditures of the foreign communities in the former settlements, of foreign tourists visiting Japan and of foreign vessels engaged in the carrying trade, as well as by the earnings of Japanese vessels and the interest on investments made by foreigners. Nevertheless there remains an appreciable margin against Japan, and it is probably to be accounted for in the consideration that she is still engaged in equipping herself for the industrial career evidenced by her in the past.

The manner in which Japan's over-sea trade was divided in 1907 among the seven foreign countries principally engaged in it may be seen from the following table:

Among the 33 open ports of Japan, the first place belongs to Yokohama in the matter of foreign trade, and Kobe ranks second. The former far outstrips the latter in exports, but the case is reversed when imports are considered. As to the percentages of the whole commerce falling to the five principal ports, the following figures may be consulted:—Yokohama, 40%; Kobe, 35-6; Osaka, 10; Moji, 5; and Nagasaki, 2.

VI. GOVERNMENT, ADMINISTRATION, &C.

Emperor and Princes.—At the head of the Japanese State stands the emperor, generally spoken of by foreigners as the mikado (honourable gate!), a title comparable with sublime porte and by his own subjects as tenshi (son of heaven) or tennō (heavenly king). The emperor Mutou Hito (q.v.) was the 121st of his line, according to Japanese history, which reckons from 660 B.C., when Jimmu ascended the throne. But as written records do not carry us back farther than A.D. 712, the reigns and periods of the very early monarchs are more or less apocryphal. Still the fact remains that Japan has been ruled by an unbroken dynasty ever since the dawn of her history, in which respect she is unique among all the nations in the world. There are four families of princes of the blood, from any one of which a successor to the throne may be taken in default of a direct heir: Princes Arisugawa, Fushimi, Kanin and Higashi Fushimi. These families are all direct descendants of emperors, and their heads have the title of shinō (prince of the blood), whereas the other imperial princes, of whom there are ten, have only the second syllable of shinō (pronounced wō when separated from shin). Second and younger sons of a shinō are all wō, and eldest sons lose the title shin and become wō from the fifth generation.

The Peerage.—In former times there were no Japanese titles of nobility, as the term is understood in the Occident. Nobles there were, however, namely, kuge, or court nobles, descendants of younger sons of emperors, and daimyō (great name), some of whom had traced their lineage to mikados; but all owed their exalted position as feudal chiefs to military prowess. The Meiji restoration of 1867 led to the abolition of the daimyōs as feudal chiefs, and they, together with the kuge, were merged into one class called kawazu (flower families), a term corresponding to aristocracy, all inferior persons being heimin (ordinary folk). In 1884, however, the five Chinese titles of kō (prince), hō (marquis), hakō (count), shi (viscount) and dan (baron) were introduced, and patents were not only granted to the ancient nobility but also conferred on men who had rendered conspicuous public service. The titles are all hereditary, but they descend to the firstborn only, younger children having no distinguishing appellation. The first list in 1884 showed 11 princes, 24 marquises, 76 counts, 324 viscounts and 74 barons. After the war with China (1894-95) the total grew to 716, and the war with Russia (1904-05) increased the list to 3,392, but has since been reduced by the death of many of the older generation.
JAPAN

Russia (1904–5) increased the number to 912, namely, 15 princes, 39 marquises, 100 counts, 267 viscounts and 382 barons.

Legislature.—The Imperial household department is completely differentiated from the administration of state affairs. It includes bureaus of treasury, forests, peerage and hunting, as well as boards of ceremonies and chamberslains, officials of the emperor, his wife and children and officials of the crown prince’s household. The annual allowance made to the throne is £300,000, and the Imperial estate comprises some 12,000 acres of building land, 3,850,000 acres of forests, and 300,000 acres of miscellaneous lands, the value of which is £19 millions sterling, but probably not yielding an income of more than £200,000 yearly. Further, the household owns about 3 millions sterling (face value) of bonds and shares, from which a revenue of some £520,000 is derived, so that the annual income of the crown and the crown prince’s household is estimated at some £5 millions.

Out of this the households of the crown prince and all the Imperial princes are supported; allowances are granted at the time of conferring titles of nobility; a long list of charties receive liberal contributions, and considerable sums are paid to encourage art and education. The emperor himself is probably one of the most frugal sovereigns that ever occupied a throne.

Departments of State.—There are nine departments of state presided over by ministers—foreign affairs, home affairs, finance, war, navy, justice, education, agriculture and commerce, communications. These ministers form the cabinet, which is presided over by the minister president of state, so that its members number ten in all. Ministers of state are appointed by the emperor and are responsible to him alone. But between the cabinet and the crown stand a small body of men, the survivors of those by whose genius modern Japan was raised to its high position among the nations. They are known as “elder statesmen.” Their proved ability constitutes an invaluable asset, and in the solution of serious problems their voice may be said to be final. At the end of 1909 four of these renowned statesmen remained—Prince Yamagata, Marquises Inouye and Matsukata and Count Okuma. There is also a privy council, which consists of a variable number of distinguished men—in 1909 there were 29, the president being Field-Marshal Prince Yamagata. Their duty is to debate and advise upon all matters referred to them by the emperor, who sometimes attends their meetings in person.

Civil Officials.—The total number of civil officials was 137,819 in 1906. It had been only 68,076 in 1898, from which time it grew regularly year by year. The salaries and allowances paid out of the treasury every year on account of the civil service are 4 millions sterling, approximately, and the annual emoluments of the principal officials are as follow:—Prime minister, £660; minister of department, £1,240; receiver-general of state, £250, or £300; governor-general of Formosa, £600; vice-minister, £400; minister plenipotentiary, £400, with allowances from £1,000 to £1,700; governor of prefecture, £300; president of council, £250; other judges, £60 to £100; professor of imperial university, £80 to £160, with allowances from £40 to £120; privy councillor, £400; director of a bureau, £300 &c.

Legislature.—The first Japanese Diet was convoked the 29th of November, 1890. There are two chambers, a house of peers (kizoku-in) and a house of representatives (shugi-in). Each is invested with the same legislative power.

The upper chamber consists of four classes of members. They are, first, hereditary members, namely, princes and marquises, who are entitled to sit when they reach the age of 25; secondly, counts, viscounts and barons, elected—after they have attained the age of 30—by their respective orders in the maximum ratio of one member to every five peers; thirdly, men of education or distinguished service who are nominated by the emperor; and, fourthly, representatives of the highest tax-payers, elected, one for each prefecture, by their own class.

The minimum age limit for non-titled members is 30, and it is provided that their total number must not exceed that of the titled members. The house was composed in 1909 of 14 princes of the blood, 15 princes, 39 marquises, 17 counts, 69 viscounts, 56 barons, 12 Imperial nominees, and 45 representatives of the highest tax-payers—that is to say, 210 titled members and 169 non-titled.

The lower house consists of elected members only. Originally the property qualification was fixed at a minimum annual payment of 30s. in direct taxes (i.e. taxes imposed by the central government), but in 1900 the law of election was amended, and the property qualification for electors is now a payment of £1 in direct taxes, while for candidates no qualification is required, either as to property or as to locality. Members are of two kinds, namely, those returned by incorporated cities and those returned by prefectures. In each case the ratio is one member for every 130,000 electors, and the electoral district is the city or prefecture.

Voting is by ballot, one man one vote, and a general election must take place once in 4 years for the house of representatives, and once in 7 years for the house of peers. The house of representatives, however, is liable to be dissolved by order of the sovereign as a disciplinary measure, in which event a general election must be held within 5 months from the date of dissolution, whereas the house of peers is not liable to any such treatment. Otherwise the two houses enjoy equal rights and privileges, except that the budget must first be submitted to the representatives. Each member receives a salary of £200; the president receives £500, and the vice-president £300. The presidents are nominated by the sovereign from three names submitted by each house, but the appointment of a vice-president must be within the rights of the house.

The lower house consists of 379 members, of whom 75 are returned by the urban population and 304 by the rural. Under the original property qualification the number of franchise-holders was only 453,474, or 11.5 to every 1000 of the nation, but it is now 1,676,007, or 15.77 to every 1000. By the constitution which created the diet freedom of conscience, of speech and of public meeting, inviolability of domicile and correspondence, security from arrest or punishment except by due process of law, permanence of judicial appointments and all the other essential elements of civil liberty were granted. In the diet full legislative authority is vested: without its consent no tax can be imposed, increased or remitted; nor can any public money be paid out except the salaries of officials, which the sovereign reserves the right to fix at will. In the emperor are vested the prerogatives of declaring war and making peace, of convening treaties, of appointing and dismissing officials, of approving and promulgating laws, of issuing urgent ordinances to take the temporary place of laws, and of conferring titles of nobility.

Procedure of the Diet.—It could scarcely have been expected that neither tumult nor intemperance would disfigure the proceedings. It is true that the majority of the members are neither degenerate statesmen nor exponents of a refined and abstract philosophy, but at least they show most of the dignities and graces by which characterize the Japanese, generally saved the situation when it threatened to degenerate into a “scene.” Foreigners entering the house of representatives in Tokyo for the first time might easily imagine an open-air assembly and herself in each member. It is painted in white on a wooden indicator, the latter being fastened by a hinge to the face of the member’s desk. When present he sets the indicator standing upright, and lowers it when leaving the house. Permission to speak is not obtained by catching the president’s eye, but by calling out the aspirant’s number, and as members often emphasize their calls by hammering their desks with the indicators, there are moments of decided din. But, for the rest, the assembly is but a rostrum. There are no galleries, no balconies, no box seats, no standing orders, no standing committees, no bar for members. There are a few displays of oratory eloquence. The Japanese formulates his views with remarkable facility. He is absolutely free from gaucherie or self-consciousness when speaking in public; he can think on his feet. But his mind does not usually centre itself with abstract ideas and subtleties of philosophical or religious thought. Flights of fancy, impassioned bursts of sentiment, appeals to the heart rather than to the reason of an audience, are devices strange to his mental habit. He can be rhetorical, but not oratory; and when among the speeches delivered in the Japanese Diet it would be difficult to find a passage deserving the latter epithet.

From the first the debates were recorded verbatim. Years before the date fixed for the promulgation of the constitution, a little band of German students, inspired by the spirit of the new law and the Japanese syllabary. Their labours remained almost without recognition or remuneration until the diet was on the eve of meeting, when it was discovered that a competent staff of shorthand reporters could not be obtained. Judges, too, numbered among the staff of the Diet.
A special feature of the Diet's procedure helps to discourage oratorical displays. Each measure of importance has to be submitted to a committee, and not until the latter's report has been received does serious debate take place. But in ninety-nine cases out of every hundred the committee's report determines the attitude of the house, and speeches are felt to be more or less superfluous. One result of this system is that business is done with a degree of celerity scarcely known in Occidental legislatures. For example, the meetings of the house of representatives during the session 1866–1867 were 32, and the number of hours occupied by the sittings aggregated 166. Yet the result was 55 bills debated and passed, several of them measures of prime importance, such as the gold standard bill, the budget and a statutory tariff law. It must be remembered that although actual sitting of the house are comparatively few and brief, the committees remain almost constantly at work from morning to evening throughout the twelve weeks of the session's duration.

**Divisions of the Empire.**—The earliest traditional division of Japan into provinces was made by the emperor Seimu (131-190), in whose time the sway of the throne did not extend farther north than a line curving from Sendai Bay, on the north-east coast of the main island, to the vicinity of Niigata (one of the treaty ports), on the north-west coast. The region northward of this line was then occupied by the Kamikura, of whom the Ainu (still to be found in Yezo) are probably the remaining descendants. The whole country was then divided into thirty-two provinces. In the 5th century the empress Jingo, on her return from her victorious expedition against Korea, re-ordered the empire into five provinces and seven circuits, in imitation of the Korean system. By the emperor Mommu (696-707) some of the provinces were subdivided so as to increase the number to sixty-six, and the boundaries thus fixed by the courts were confirmed by the emperor Shomu (723-756). The old division is as follows:

1. **Nihon** (i.e. home provinces), viz.:—
2. **Chishu** (or “western-sea circuit”), which comprised nineteen provinces, viz.:—

Upon comparing the above list with a map of Japan, it will be seen that the main islands contain the Go-kaišu, Tōkai, Tōhoku, and Kanto divisions of Japan. The province of Shinshu, omitted also the island of Awaji, the remaining provinces of the Nankaidō give the name Shikoku (the “four provinces”) to the island in which they lie; while Sakaidō coincides exactly with the large island Kii (the “nine provinces”).

In 1868, when the rebellious nobles of Shinshu and Dewa in the Tōhoku, had submitted to the emperor, those two provinces were subdivided, Dewa into Uzen and Ugo, and Ōshū into Ōwaki, Ishikawa, Kuzukata, Kitami, Itō, Hikari, Tokachi, Kurihara, and Nemuro, and the Kurile Islands (Chishima).

Another division of the old sixty-six provinces was made by taking as a central point the ancient baronies of Osaka on the frontier of Ōmi and Yamashiro,—the region lying on the east, which consisted of thirty-three smaller districts being called Kai, and of one of the barrier, the remaining thirty-three provinces on the west being styled Kwansei, or “west of the barrier.” At the present time, however, the term Kwanxō is applied to only the eight provinces of the Settsu, Saga, Kazoku, Shimousaka, Kazusa, Shimōsa, Awa and Hitachī, all lying immediately to the east of the old baronies of Hakone, in Sagami.

**Chū-goku,** or “central provinces,” is a name in common use for the Sanin and Sanyō provinces taken together. *Sakoku,* or “remote provinces,” is another name for Kiiūshū, which in books again is frequently called *Chinese.*

Local Administrative Divisions.—For purposes of local administration Japan is divided into 31 provinces (fu), 43 rural prefectures (ken), and 3 special divisions (cho), namely formosa, Hokkaidō and South Sakhalin. Formosa and Sakhalin not having been included in Japan’s territories until 1895 and 1905, respectively, are still under the military control of a governor-general, and belong, therefore, to an administrative system different from that prevailing throughout the rest of the country. The prefectures and Hokkaidō are divided again into 638 sub-prefectures (gun or korō); 60 towns (shi); 125 urban districts (cho) and 12,747 rural districts (son). The three urban prefectures are Tokyo, Osaka and Kōtō, and the urban and rural districts are distinguished according to the number of houses they contain. Each prefecture is named after its chief town, with the exception of Okinawa, which is the appellation of a group of islands called also Kūkō (Luchu). The following table gives the names of the prefectures, their areas, populations, number of sub-prefectures, towns and urban and rural divisions:

The towns are classified into urban, prefectural and Central Japan.

1. The names given in italics are those more commonly used. Those in the first column are generally of pure native derivation; those in the second column are composed of the Chinese word shē, a “province,” added to the Chinese pronunciation of one of the characters by which the native name is written. In a few cases both names are used.

2. This is not the population of the city proper, but that of the urban prefecture.
company that contracts for the execution of public works or the supply of articles to a local administration, as well as from persons unable to write their own names and the name of the candidate for whom they vote. Members of assembly are not paid. For prefectoral and sub-prefectural assemblies the term is four years; for town and district assemblies, six years, with the provision that one-half of the members must be elected every third year. The prefectoral assemblies hold one session of 30 days; the sub-prefectural assemblies, one session of not more than 14 days. The town and district assemblies have no regular session; they are summoned by the mayor or the head-man when their deliberations appear necessary, and they continue in session till their business is concluded.

The chief function of the assemblies is to deal with all questions of local finance. They discuss and vote the yearly budgets; they pass the settled accounts; they fix the local taxes within a maximum limit fixed by law, and they may, in case of necessity, order the raising of extraordinary taxes; they make representations to the minister for home affairs; they are to deal with the fixed property of the locality; they raise loans, and so on. It is necessary, that they should obtain the consent of the minister of finance and sometimes of the minister of finance also, before disturbing any objects of scientific, artistic or historical importance; before contracting loans; before imposing special taxes or passing the normal limits of taxation; before enacting new local regulations or amending the old; before dealing with grants in aid made by the central government. The prefecture, who is appointed by the central administration, is invested with considerable power. He oversees the carrying out of all works undertaken for the public expense; he is bound to assist the mayor in the supervision of the accounts of the fund and of the property of the prefecture; he orders payments and receipts; he directs the machinery for collecting taxes and fees; he summons a prefectural assembly, opens it and closes it, and has competence to suspend the ordination if such a course seems necessary. Many of the functions performed by the governor with regard to prefectoral assemblies are discharged by a head-man (gan-chō) in the case of sub-prefectural assemblies. This head-man is a member of the central administration. He convenes and opens and closes the sub-prefectural assembly, if necessary may recall it, reconsider any of his financial decisions that seem improper, explaining his reasons for doing so, and should the assembly adhere to his decision, he may refer the matter to the governor of the prefecture. On the other hand, it is necessary for the governor to appeal to the home minister from the governor's decision. The sub-prefectural head-man may also take upon himself, in case of emergency, any of the functions falling within the competence of the sub-prefecture, and in so doing, report the facts to the assembly and seeks its sanction at the earliest possible opportunity. In each district also there is a head-man, but the post is always elective and generally non-salaried. He occupies the position by an act of the central government; he cannot, however, be dismissed except by the emperor's consent, order the dissolution of a local assembly, provided that steps are taken to elect and convene another within three months.

The machinery of local administration is completed by councils, of which the governor of a prefecture, the mayor of a town, or the head-man of a sub-prefecture or district, is ex officio president, and the councillors are partly elective, partly nominated by the central government. The manner in which the central state to stand in an executive position towards the local legislatures, namely, the assemblies, for the former give effect to the measures voted by the latter, take their place in cases of emergency and consider questions submitted by them. The system of local government has been in operation since 1885, and has been found to be satisfactory. It constitutes a thorough method of political education for the people. In feudal days popular representation had no existence, but a very effective chain of local responsibility was manufactured by dividing the community into preventures and quarter-preventures, and holding the landowners of each, who were held jointly liable for any offence committed by one of their members. Thus it cannot be said that the people were altogether unprepared for this new system.

The Army.—The Japanese—as distinguished from the aboriginal inhabitants of Japan—having fought their way into the country, are naturally described in their annals as a nation of soldiers. The sovereign is said to have been the commander-in-chief and his captains were known as o-mi and 0-yo, while the duty of serving in the ranks devolved on all subjects alike. This information is indeed

---

\[2\] The mayor of a town (shichō) is nominated by the minister for home affairs from three men chosen by the town assembly.
derived from tradition only, since the first written record goes back no further than 712. We are justified, however, in believing that at the close of the 7th century of the Christian era, when the empress Jito sat upon the throne, the social system of the Tang dynasty of China commended itself for adoption; the distinction of civil and military is said to have been then established for the first time, though it probably concerned officials only. Certain officers received definitely military commissions, as generals, brigadiers, captains, and so on; a military office (kyōbu-shō) was organized, and each important district throughout the empire had its military division (gundan). One-third—some say one-fourth—of the nation’s able-bodied males constituted the army. 

Tactically there was a complete organization, from the squad of 5 men to the division of 600 horse and 400 foot. Service was for a defined period, during which taxes were remitted, so that military duties always found men ready to discharge them. Thus the hereditary soldier—afterwards known as the samurai or bushi—did not yet exist, nor was there any such thing as an exclusive right to carry arms. Weapons of war, the property of the state, were served out when required for fighting or for training purposes. At the close of the 8th century stubborn insurrections on the part of the aborigines gave new importance to the soldier. The conscription list had to be greatly increased, and it came to be a recognized principle that every stalwart man should bear arms, every weakling being a bread-winner. Thus, for the first time, the distinction between “soldier” and “working man” received official recognition, and in consequence of the circumstances attending the distinction a measure of contempt attached to the latter. The next step in development had its origin in the assumption of high offices at state by great families, who enroached upon the imperial prerogatives, and appropriated as hereditary perquisites posts which should have remained in the gift of the sovereign. The Fujiwara clan, taking all the civil offices, resided in the capital, whereas the military posts fell to the lot of the Taira and the Minamoto, who, settling in the provinces and being thus required to guard and police the outside districts, found it expedient to surround themselves with men who made soldiering a profession. These latter, in their turn, transmitted their functions to their sons, so that there grew up in the shadow of the great houses a number of military families devoted to maintaining the power and promoting the interests of their masters, from whom they derived their own privileges and emoluments.

From the middle of the 10th century, therefore, the terms samurai and bushi acquired a special significance, being applied to themselves and their followers by the local magnates, whose power tended more and more to eclipse even that of the throne, and finally, in the 12th century, when the Minamoto brought the whole country under the sway of military organization, the privilege of bearing arms was restricted to the samurai. Thenceforth the military class entered upon a period of administrative and social superiority which lasted, without serious interruption, until the middle of the 15th century. But it is to be observed that the distinction between soldier and civilian, samurai and commoner, was not of ancient existence, nor did it arise because of the question of race or caste, victory or vanquished, as is often supposed and stated. It was an outcome wholly of ambitious usurpations, which, relying for success on force of arms, gave practical importance to the soldier, and invested his profession with factitious dignity.

The bow was always the chief weapon of the fighting-man in Japan. “War” and “bow-and-arrow” were synonymous terms.

Weapons. Tradition tells how Tametomo shot an arrow through the crest of his brother’s helmet, in order to recall the youth’s allegiance without injuring him; how Nasuno Michitaka discharged a shaft that severed the stem of a fan swayed by the wind; how Mutsuru, ordered by an emperor to rescue a fish from the talons of an osprey without killing bird or fish, cut off the osprey’s feet with a crescent-headed arrow so that the fish dropped into the palace lake and the bird continued its flight; and there are many other records of Japanese skill with the weapon. Still better authenticated were the feats performed by the Japanese halls in Kiōto and Yedo, where the archer had to shoot an arrow through the whole length of a corridor 128 yards long and only 16 ft. high, a Daibachi, in the 17th century, succeeded in sending 813 arrows from the corridor—this against the rules, being an average of over 5 shafts per minute; and Masotoki, in 1852, made 3583 successful shots in 20 hours, more than 4 a minute. The lengths of the bow and arrow were determined with reference to the physical development of the archers, and the archer needed a long bow. The shortest distance was the distance between the tips of the thumb and the little finger with the hand fully stretched. Fifteen of these units gave the length of the bow—the maximum being about 7½ ft. The unit for measuring the length of arrows was from 0 ft. to 3½ ft. Originally the bow was of unvarnished boxwood or bamboo, but subsequently bamboo alone came to be employed. Binding with cord or rattan served to strengthen the bow, and for precision of flight the arrow had three feathers, an eagle’s wing being most esteemed for that purpose, and after attaching that of the copper pheasant, the crane, the adjutant, and the snipe. Next in importance to the bow came the sword, which is often spoken of as the samurai’s chief weapon, though there can be no doubt that during long ages samurai ranked next to the warrior with a single-edged weapon remarkable for its three exactly similar curves—edge, face-line and back; its almost imperceptibly convexed blade; its remarkable tempering; its consummately skilled forging; its razor-like sharpness; its striking power; and its maximum efficiency of stroke. The 10th century saw this weapon carried to perfection, and it has been inferred that from that epoch did the samurai begin to esteem his sword as the greatest treasure that could be possessed. He was only too conscious of the value of sword and the man. Many pages of Japanese annals and household traditions are associated with its use. In every age numbers of men devoted their whole lives to acquiring novel skill in swordsmanship. Many of the books left us containing systems differing from one another in some subtle details unknown to any save the author and his favourite pupils. Not merely the method of handling the weapon had to be studied. Associated with sword-play was an art variously known as chidachi, kinjutsu, kenshi, and samuichigetai, names which imply the exertion of muscular force in such a manner as to cause the utmost possible effect of a minimum of effort, by directing an adversary’s strength so as to become of auxiliary to one’s own. It was an essential element of the extras to be not only that he should be competent to defend himself with any object he could lay hands on, but also that without an orthodox weapon he should be capable of inflicting fatal or disabling injury on an assailant. In the many recorded great swordsmen instances are related of men seizing a piece of firewood, a piece of fish, or a stick in a moment of offense, while, on the other side, an umbrella, an iron fan or even a pot-lid served for protection. The samurai had to be prepared for every emergency. Were they caught weaponless by a number of assailants, his habit was supplemented by a dagger carried in the bosom, or by expedients for emerging unscathed. Nothing counted save the issue. The methods of gaining victory or the circumstances attending defeat were scarcely taken into consideration. The true samurai had to the measure of his powers bestowed, till on an expert sword-smith, the traditions that had grown up around celebration and study needed to be a competent judge of a sword’s qualities—all these things conspired to give the katana an importance beyond the limits of mere defensive comprehension. A samurai carried at least two swords, a long one for the charge, a short one, the tachi, being thrust into his girdle, not slung from it, being fastened in their place by cords of plated silk. Sometimes he increased the number by three, four or even five, before going into battle, and this array was supplemented by a dagger carried in the bosom. The short sword was not employed in the actual combat. Its use was to cut off an enemy’s head after overthrowing him, and it also served a defeated soldier in his last resort—suicide. In general the long sword of the samurai was 5 ft. 3 in. long, including the hilt; but some were 5 ft. long, and some 7. Considering that the scabbard, being

1 The term hyaku-shō, here translated “working man,” means literally “one engaged in any of the various callings” apart from military service. In a later age a further distinction was established between the agriculturist, the artisan, and the trader, and the word hyaku-shō then came to carry the signification of “husbandman” only.
fastened to the girdle, had no play, the feat of drawing one of those very long swords demanded extraordinary aptitude. Spear and glaive were also ancient Japanese weapons. The oldest form of spear was derived from China. Its handle measured about 6 ft. long and at the point of contact was sharpened to a leaflike blade and hilt (somewhat resembling a European rapier). This weapon served almost exclusively for guarding palisades and gates. In the 14th century a true lance came into use. Its length varied greatly, and it was sometimes hafted and carried in the hand, but as it was so long, it could not be used in very loose formation, the former served for close-order fighting.

Japanese armour (gisoku) may be broadly described as plate armour, but the essential difference between it and the European type was that, whereas the latter took its shape through the body, the former was intended to resemble ordinary garments. Hence the only changes that occurred in Japanese armour from generation to generation had originated in improved methods of construction. In general appearance it differed considerably from that of all other nations. Although, although, to its essential parts we may apply the propriety the European terms —helmet, corselet, &c.—individually and in combination these parts were not at all like the originals of those names. Perhaps the easiest way to describe the design of the latter is to say that European knight seemed to clad in a suit of metal clothes, a Japanese samurai looked as if he wore protective coverings. The Japanese armour was, in fact, suspended from, rather than fitted to, the body. It was divided into sections, each of its parts found a front between the horns of the helmet and the tip of the bow, or worn on the shoulders and back, the purpose in either case being to turn the point of an arrow. A true samurai observed strict rules of etiquette, and regard even to the garments worn under his armour, and it was part of his soldierly capacity to be able to bear the weight of the whole without loss of activity, a feat impossible to any untrained man of modern days. Common soldiers were generally content with a wooden haube, the innumerable bowmen might only be allowed to wear a corselet.

The Japanese never had a war-horse worthy to be so called. The mis-shapen ponies which carried them to battle showed qualities of hardiness and endurance, but were so deficient in form that no amount of training could make them fit for the war-horse. In voluminous armour they looked painfully puny. Nothing is known of the early Japanese saddle, but at the beginning of historic times it approximated closely to the Chinese type. Subsequently a purely Japanese type of horse was designed. It consisted of a wooden frame, the innumerable bowmen could be fastened to it. Galloped all over with unknown with such a saddle; it fitted any horse. The stirrup, originally a simple affair resembling that of China and Europe, afterwards took the form of a comfortable foot. Both grooms and saddle-frame were often of beautiful workmanship, the former covered with rich gold lacquer, the latter inlaid with gold or silver. The saddle on the latter part of the military epoch chain-armor was adopted for the horse, and its hauberg, closely incasing the whole animal, made the form of fragments.

Flags were used in battle as well as on ceremonial occasions. Some were monochrome, as the red and white flags of the Taira Early Strategy and Tactics and the Minamoto clans in their celebrated struggle during the 12th century; and some were streamers emblazoned with figures of the sun, moon, dragon, tiger and so forth, or with religious legends. Fans with iron ribs were carried by commanding officers, and signals to advance or retreat were given by beating drums and metal gongs and blowing conchs. During the military epoch a campaign was opened or a contest predicated by a human sacrifice to the god of war, the victim at this rite of blood (chi-matsuri) being generally a prisoner or a condemned criminal. Although ambushes and surprises played a large part in all strategy, pitched battles were the general rule, and it was essential that notice of an intention to attack should be given by discharging a singing arrow. Thereafter the assaulting army, taking the word from its commander, raised a shout of “Ei! Ei!” to which the side replied, and the formalities having been thus satisfied, the fight commenced.

In early medieval days tactics were of the crudest description. An army consisted of a congeries of little bands, each under the order of a chief who considered himself independent, and instead of subordinating his movements to a general plan, struck a blow wherever he pleased. From time immemorial a romantic value has attached to Japan of the first of anything: the first snow of winter; the first water drawn from the well on New Year’s Day; the first blossom of the spring; the first note of the nightingale. So in war the first to ride up to the foe or the wielder of the first spear was held in high honour, and a samurai strove for that distinction as his principal duty. It necessarily resulted, too, not only from the nature of the weapons employed, but also from the immense leisure devoted by the true samurai to perfecting himself in their use, that displays of individual prowess were deemed the chief object in a battle. Some tactical formations borrowed from China were familiar in Japan, but their intelligent use and their modification to suit the circumstances of the time were inaugurated only by the great captains of the 15th and 16th centuries. Prior to that epoch a battle resembled a gigantic fencing match. Men fought as individuals, not as units of a tactical formation, and the engagement consisted of a number of personal duels, all in simultaneous progress. It was the samurai’s habit to proclaim his name and titles in the presence of the enemy, sometimes adding from his own record or his father’s any details that might tend to dispirit his hearers. Then some one advancing to cross weapons with him would perform the same ceremony of self-introduction, and if either found anything to upbraid in the other’s antecedents or family history, he did not fall to make loud reference to it, such a device being countenanced as a means of disturbing an adversary’s sang-froid, though the principle underlying the mutual introduction was courtesy. The duellists could reckon on finishing their fight undisturbed, but the victor often had to endure the combined assault of a number of the cowards or retainers of the vanquished. Of course a skilled swordsman did not necessarily seek a single combat; he was equally ready to ride into the thick of the fight without discrimination, and a group of common soldiers never hesitated to make a united attack upon a mounted officer if they found him disengaged. But the general feature of a battle was individual contests, and when the fighting had ceased, each samurai proceeded to the tent of the commanding officer and submitted for inspection the heads of those whom he had killed.

The disadvantage of such a mode of fighting was demonstrated for the first time when the Mongols invaded Japan in 1274. The invaders moved in phalanx, guarding themselves with pavises, and covering their advance with a host of archers shooting clouds of poisoned arrows. When a Japanese samurai advanced singly and challenged one of them to combat, they opened their ranks, enclosed the challenger and cut him to pieces. Many Japanese were thus slain, and it was not until the moment of attack when they produced any effect upon the enemy. But although the advantage of massing strength seems to have been recognized, the Japanese themselves did not adopt the formation which the Mongols had shown to be so formidable. Individual prowess continued to be the prominent factor in battles down to a comparatively recent period. The great captains Takeda Shingen and Yugeski Keshin are supposed to have been Japan’s pioneer tacticians. They certainly appreciated the value of a formation in which the action of the individual should be subordinated to the unity of the whole. But when it is remembered that fire-arms had already been in the hands of the Japanese for several years, and that they had means of acquainting themselves with

---

1 A tent was simply a space enclosed with strips of cloth or silk, on which was emblazoned the crest of the commander. It had no covering.

2 The Japanese never at any time of their history used poisoned arrows; they despised them as depraved and inhuman weapons.
the tactics of Europe through their intercourse with the Dutch, it is remarkable that the changes attributed to Takeda and Uesugi were not more drastic. Speaking broadly, what they did was to organize a column with the musqueteers and archers in front; the spearmen and swordsmen in the second line; the cavalry in the third line; the commanding officer in the rear, and the drums and standards in the centre. At close quarters the spear proved a highly effective weapon, and in the days of Hideyoshi (1536–1598) combined flank and front attacks by bands of spearmen became a favourite device. The importance of a strong reserve also received recognition, and in theory, at all events, a tolerably intelligent system of tactics was adopted. But not until the close of the 17th century did the doctrine of strictly disciplined action obtain practical vogue. Yamaga Soko is said to have been the successful inculcator of this principle, and from his time the most approved tactical formation was known as the Yamaguri (Yamaga) style, though it showed no other innovation than strict subordination of each unit to the general plan.

Although, tactically speaking, the samurai was everything and the system nothing before the second half of the 17th century, and although strategy was chiefly a matter of deception, surprises and ambushes, it must not be supposed that there were no classical principles. The student of European military history searches in vain for the rules and maxims of war so often invoked by glib critics, but the student of Japanese history is more successful. Here, as in virtually every field of things Japanese, retrospect discovers the ubiquitous Chinaman. The treatises of Sung and 'Ng (called in Japan Son and Go) Chinese generals of the third century after Christ, were the classics of Far-Eastern captains through all generations. See, for example, the Book of War, tr. E. F. Calthrop (C. B. 306), and the Book of Military Regulations, tr. L. G. How (C. B. 1536). In the 14th century, a Chinese captain, derived his materials almost entirely from the two Chinese monographs. The samurai was the military man. They were to the samurai what the Mahayana was to the Buddhist. They were beautiful, and had to collect whatever of good had preceded them, and to have forecast whatever of good the future might produce. The character of their strategic methods, somewhat analogous to those of 18th-century Europe, may be gathered from the following:

"An army undertaking an offensive campaign must be twice as numerous as the enemy. A force investing a fortress should be numerically ten times the garrison. When the adversary holds high ground, turn his flank; do not deliver a frontal attack. When he has a mountain or a river behind him, cut his lines of communication. If he deliberately assumes a position from which victory is his only escape, hold him there, but do not molest him. If you can surround him, leave one open route for his escape, since desperate means are not always successful. When you have to cross a river, put your advance-guard and your rear-guard at a distance from the banks. When the enemy has to cross a river, let him get well enclosed in the operation before you strike him. In a march, make celerity your first principle. Do not take a long route, or approach any thicket until your scouts have explored it fully."

Such precepts are multiplied; but when these ancient authors discuss tactical formations, they do not seem to have contemplated anything like rapid, well-ordered changes of mobile, highly trained masses of men from one formation to another, or their quick transfer from point to point of a battlefield. The basis of their tactics is The Book of Changes. Here again is encountered the superstition that underlies nearly all Chinese and Japanese institutions: the superstition that took captive even the great mind of Confucius. The positive and the negative principles; the sympathetic and the antipathetic elements; cosmos growing out of chaos; chaos re-absorbing cosmos—on such fancies they founded their tactical system. The result was a phalanx of complicated organization, difficult to manoeuvre and liable to be easily thrown into confusion. Yet when Yamaga in the 17th century interpreted these ancient Chinese treatises, he detected in them suggestions for a very shrewd use of the principle of échelon, and applied it to devise formations which combined much of the frontal expansion of the line with the solidity of the column. More than that cannot be said for Japanese tactical genius. The samurai was the best fighting unit in the Orient—probably one of the best fighting units the world ever produced. It was perhaps because of that excellence that his captains remained indifferent tacticians.

In estimating the military capacity of the Japanese, it is essential to know something of the ethical code of the samurai, the bushido (way of the warrior) as it was called. A typical example of the rules of conduct prescribed by feudal chieftains is furnished in the code of Kato Kiyomasa, a celebrated general of the 16th century:

**Regulations for Samurai of every Rank; the Highest and Lowest alike.**

1. The routine of service must be strictly observed. From 6 a.m. military exercises shall be practised. Archery, gunnery and martial exercises must be mastered. If any man shows exceptional proficiency he shall receive extra pay.

2. Those that desire recreation may engage in hawkng, deer-hunting or wrestling.

3. In regard to dress, garments of cotton or pounge shall be worn. Any man incurring debts owing to extravagance of costume or living shall be considered a law-breaker. If, however, being zealous in the practice of military arts suitable to his rank, he desires to hire instructors, an allowance may be granted to him for that purpose.

4. The staple of diet shall be unhulled rice. At social entertainments one guest for one host is the proper limit. Only when men are assembled for military exercises shall many dine together.

5. It is the duty of every samurai to make himself acquainted with the principles of his craft. Extravagant displays of adornment are forbidden in battle.

6. Practicing or organizing dances is unlawful; it is likely to betray sword-carrying men into acts of violence. Whatever a man does should be done with his heart. Therefore for the soldier military amusements alone are suitable. The penalty for violating this provision is death by suicide.

7. Learning shall be encouraged. Military books must be read. The spirit of loyalty and filial piety must be educated before all things. Poem-compising pastimes are not to be engaged in by samurai. To be addicted to such amusements is to resemble a woman. A man born a samurai should live and die sword in hand. Unless he is thus trained in time of peace, he will be useless in the hour of stress. To be brave and warlike must be his invariable characteristic.

8. Whosoever finds these rules too severe shall be relieved from service. Should investigation show that any one is so unfortunate as to lack manly qualities, he shall be singled out and dismissed from service. The imperative character of these instructions must not be doubted.

The plainly paramount purpose of these rules was to draw a sharp line of demarcation between the samurai and the couriers living in Kito. The dancing, the couplet-composing, the sumptuous living and the fine costumes of the officials frequenting the imperial capital were strictly interdicted by the feudal lords. Frugality, fealty and filial piety—these may be called the fundamental virtues of the samurai. Owing to the circumstances out of which his caste had grown, he regarded all bread-winning pursuits with contempt, and despised money. To be wayed in the smallest degree by mercenary motives was despicable in his eyes. Essentially a stoic, he made self-control the ideal of his existence, and practised the courageous endurance of suffering so thoroughly that he could without trifling with his own or the body pain of the most horrible description. Nor can the courage of the samurai justly be ascribed to bluntness of moral sensibility resulting from semi-savage conditions of life. From the 8th century onwards the current of existence in Japan set with general steadiness in the direction of artistic refinement and voluptuous luxury, amidst which men could scarcely fail to acquire habits and tastes inconsistent with acts of high courage and great endurance. The samurai's mood was not a product of semi-barbarism, but rather a protest against emasculating civilization. He schooled himself to regard death by his own hand as a normal eventuality. The story of other nations shows
epochs when death was welcomed as a relief and deliberately invited as a refuge from the mere weariness of living. But whereas there has been liberty to choose, and leisure to employ, a painless mode of exit from the world, men have invariably selected it. The samurai, however, adopted in karakiri (disembowelment) a mode of suicide so painful and so shocking that to school the mind to regard it with indifference and perform it without flinching was a feat not easy to conceive. Assistance was often rendered by a friend who stood ready to decapitate the victim immediately after the stomach had been gashed; but there were innumerable examples of men who consummated the tragedy without aid, especially when the sacrifice of life was by way of protest against the excesses of a feudal chief or the crimes of a ruler, or when some motive for secrecy existed. It must be observed that the suicide of the samurai was never inspired by any doctrine like that of Hegesias. Death did not present itself to him as a legitimate means of escaping from the cares and disappointments of life. Self-destruction had only one consolatory aspect, that it was the soldier's privilege to expiate a crime with his own sword, not under the hand of the executioner. It rested with his feudal lord and liege to decide whether guilt or innocence lay. It was never to question the justice of an order to commit suicide, but to obey without murmur or protest. For the rest, the general motives for suicide were to escape falling into the hands of a victorious enemy, to remonstrate against some official abuse which no ordinary complaint could reach, or, by means of a dying protest, to turn a liege lord from pursuing courses injurious to his reputation and his fortune. This last was the noblest and by no means the infrequent reason for suicide. Scores of examples are recorded of men who, with everything to make existence desirable, deliberately laid down their lives at the prompting of loyalty. Thus the samurai rose to a remarkable height of moral nobility. He had no assurance that his death might not be wholly fruitless, as indeed it often proved. If the sacrifice achieved its purpose, if it turned a liege lord from evil courses, the samurai could hope that his memory would be honoured. But if the lord resented such a violent and conspicuous mode of reproving his excesses, then the faithful vassal's retribution would be an execrated memory and, perhaps, suffering for his family and relatives. Yet the sacrifice was performed again and again. It remains to be noted that the samurai entertained a high respect for the obligations of truth; "A bushi has no second word," was one of his favourite maxims. However, a reservation is necessary here. The samurai's doctrine was not truth for truth's sake, but truth for the sake of the spirit of uncompromising manliness on which he based all his code of morality. A pledge or a promise must never be broken, but the duty of veracity did not override the interests or the welfare of others. Generosity to a defeated foe was also one of the tenets of the samurai's ethics. History contains many instances of the exercise of that quality.

Something more, however, than a profound conception of duty was needed to nerve the samurai for sacrifices such as he seems to have been always ready to make. It is true that Japanese parents of the military class took pains to familiarize their children of both sexes from very tender years with the idea of self-destruction at any cost. But superadded to the moral education and the incentive of tradition there was a transcendental influence. Buddhism supplied it. The tenets of that creed divided themselves, broadly speaking, into two doctrines, salvation by faith and salvation by works, and the chief exponent of the latter principle is the sect which prescribes meditation as the vehicle of enlightenment. Whatever be the mental processes induced by this rite, those who have practised it insist that it leads finally to a state of absorption, in which the mind is flooded by an illumination revealing the universe in a new aspect, absolutely free from all traces of passion, interest or affection, and showing, written across everything in flaming letters, the truth that for him who has found Buddha there is neither birth nor death, growth nor decay. Lifted high above his surroundings, he is prepared to meet every fate with indifference. The attainment of that state seems to have been a fact in the case both of the samurai of the military epoch and of the Japanese soldier to-day.

The policy of seclusion adopted by the Tokugawa administration after the Shimabara insurrection included an order that no samurai should acquire foreign learning. Nevertheless some knowledge could not fail to filter in through the Dutch factory at Deshima, and thus, a few years before the advent of the American ships, Taka-shima Shūhan, governor of Nagasaki, becoming persuaded of the fate his country must invite if she remained oblivious of the world's progress, memorialized the Yedo government in the sense that, unless Japan improved her weapons of war and reformed her military system, she could not escape humiliation such as had just overtaken China. He obtained small arms and field-guns of modern type from Holland, and, repairing to Yedo with a company of men trained according to the new tactics, he offered an object lesson for the consideration of the conservative officials. They answered by throwing him into prison. But Egawa, one of his retainers, proved a still more zealous reformer, and his foresight being vindicated by the appearance of the American war-vessels in 1853, he facetiously exclaimed that the policy of seclusion had been a grand experiment upon which the Yedo government had acted as the investigator, and was entrusted with the work of planning and building forts at Shinagawa and Shimoda. At Egawa's instance rifles and cannon were imported largely from Europe, and their manufacture was commenced in Japan, a powder-mill also being established with machinery obtained from Holland. Finally, in 1862, the shōgun's government adopted the military system of the West, and organized three divisions of all arms, with a total strength of 13,600 officers and men. Disbanded at the fall of the shōgunate in 1867, this force nevertheless served as a model for a similar organization under the imperial government, and in the meanwhile the principal fiefs had not been idle, some—as Satsuma—adopting English tactics, others following France or Germany, and a few choosing Dutch. There appeared upon the stage at this juncture a great figure in the person of Omura Masujirō, a samurai of the Chōshū clan. He established Japan's first military school at Kōto in 1868; he attempted to substitute for the hereditary soldier conscripts taken from all classes of the people, and he conceived the plan of dividing the whole empire into six military districts. An assassins' dagger pointed at him on the threshold of these great reforms, but his statue now stands in Tōkyō and his name is spoken with reverence by all his countrymen. In 1870 Yamagata Aritomo (afterwards Field-Marshall Prince Yamagata) and Saigo Tsugumichi (afterwards Field-Marshall Marquis Saigo) returned from a tour of military inspection in Europe, and in 1872 they organized a corps of Imperial guards, taken from the three clans which had been conspicuous in the work of restoring the administrative power to the sovereign, namely, the clans of Satsuma, Chōshū and Tosa. They also established garrisons in Tōkyō, Sendai, Osaka and Kumamoto, thus placing the military authority in the hands of the central government. Reforms followed quickly. In 1872, the hyōbusō, an office which controlled all matters relating to war, was replaced by two departments, one of war and one of the navy, and, in 1873, an imperial decree substituted universal conscription for the system of hereditary militarism. Many persons viewed this experiment with deep misgiving. They feared that it would not only subordinate the samurai, but also entrust the duty of defending the country to men unfitted by tradition and custom for such a task, namely, the farmers, artisans and tradespeople, who, after centuries of exclusion from the military pale, might be expected to have lost all martial spirit. The government, however, was not deterred by these apprehensions. It argued that since the distinction of samurai and commoner had not originally existed, and since the former was a product simply of accidental conditions, there was no valid reason to doubt the military capacity of the people at large. The justice of this reasoning was put to a conclusive test a few years later. Originally the period of service with the colours was fixed at 3 years, that of service with the first and second reserves being 2 years each. One of the serious difficulties

---

**SAMURAI**

**JAPAN** 209
encountered at the outset was that samurai conscripts were too proud to stand in the ranks with common rustics or artisans, and above all to obey the commands of plebeian officers. But patriotism soon overcame this obstacle. The whole country—except the northern island, Yezo—was parceled out into six districts (headquarters Tōkyō, Osaka, Nagoya, Sendai, Hiroshima and Kumamoto) each furnishing a 
division of all arms and services. There was also from 1876 a 
guards division in Tōkyō. The total strength on a peace footing was 
33,680 of all arms, and on a war footing, 46,359. The defence of 
Yezo was entrusted to a colonial militia. It may well be 
supposed that to find competent officers for the army greatly 
perplexed its organizers. The military school—now in Tōkyō 
but originally founded by Omura in Kishin—had to turn out 
gradsuates at high pressure, and private soldiers who showed any 
specific aptitude were quickly promoted to positions of command. 
French military instructors were engaged, and the work of 
translating manuals was carried out with all celerity. In 1877 
this new army of conscripts had to endure a crucial test: it had to 
take the field against the Satsuma samurai, the very flower of 
their class, who in that year openly rebelled against the Tōkyō 
government. The campaign lasted eight months; as there had 
not yet been time to form the reserves, the Imperial forces were 
soon seriously reduced in number by casualties in the field and 
by disease, the latter claiming many victims owing to defective 
commissariat. It thus became necessary to have recourse to volunteers, but as these were for the most part samurai, the 
expectation was that their hereditary instinct of fighting would compensate for lack of training. That expectation was not 
fulfilled. Serving side by side in the field, the samurai volunteer 
and the heimin regular were found to differ by precisely 
the degree of 1:2.2:3.7. In 1878, the experiment was 
finally established that the fighting qualities of the farmer 
and artisan reached as high a standard as those of the bushi.

For the rest, the story of the Japanese army is one of steady 
progress and development. In 1878, the 12 divisions of 
infantry and train were divided among three offices: namely, the army department, the general staff and the inspection department, while the six 
divisions of troops were organized into three army corps. 
In 1879, the total period of colour and reserve service became 4 
years. In 1883 the period was extended to 12 years, the list 
of exemptions was abbreviated, and above all substitution was no 
longer allowed. Great care was devoted to the training of officers; 
preparations were made for the training of non-combatants, and 
selective conscription was abandoned. The old system of 
officers were sent abroad every year to study. A comprehensive 
system of education for the rank and file was organized. Great 
difficulty was experienced in procuring horses suitable for cavalry, 
and a large number of them was supplied by the military hospital. 
In 1886, the whole littoral of the empire was divided into five 
districts, each with its admiralty and its naval port, and the army 
being made responsible for coast defence, a battery construction 
corporation was organized, and an exhaustive scheme was elaborated 
to secure full co-operation between the army and navy. In 1888 
the seven divisions of the army first formed themselves prepared 
to take the field, and, in 1893, a revised system of mobilization was 
conceived, to be put into operation the following year, for the Chinese 
War (v. p. 314). At this period the division, mobilized for 
service in the field, consisted of 12 battalions of infantry, 3 troops of 
cavalry, 4 batteries of field and 2 of mountain artillery, 2 companies 
of field-guns, 1 field battery, 15 guns of all arms with 200 horses. 
The guards had only 8 battalions and 4 batteries (field). 
The field army aggregated over 120,000, with 168 field and 72 mountain 
guns, and the total of all forces, field, garrison and depot, was 220,580 of 
all ranks in 35,633 (officers, 3,108). On the outbreak of war, a number of 
various modifications necessitated by circumstances, the numbers 
actually on duty were over 240,000, with 6495 non-combatant 
employees and about 100,000 coolies who acted as carriers. The 
infantry were armed with the Murata single-loader rifle, but the 
field artillery was inferior, and the only two divisions equipped with 
magazine rifles and smokeless powder never came into action. 
The experiences gained in this war bore large fruit. The total 
time of service was reduced from a year to six months. In 1891, 
the colonial militia of Yezo (Hokkaido) was organized as a seventh 
division; 5 new divisions were added, bringing the number of 
divisions to 13 (including the guards); a mixed brigade was 
stationed at Kure, and (see p. 313) a high military council composed of 
soldiers—military councillors was created: the 
cavalry was brigaded; the garrison artillery was increased. 

APPENDIX

1 The general term for commoners as distinguished from samurai.
possesses certain educational qualifications is entitled to volunteer for training. If accepted after medical inspection, he serves with the colours for one year, during three months of which time he must live in barracks—unless a special permit be granted by his commandant. In barracks he has to contribute to contention and equipment, although youths who cannot afford the full expense, if otherwise qualified, are assisted by the state. At the conclusion of a year’s training the volunteer is drafted into the first reserve for 61 years, during which period he is required to attend for two days a year. The second period (121 years) of service before passing into the territorial army is the same as that of an ordinary conscript. The main purpose of the one-year volunteer, as in Germany, is to provide officers for the permanent army. Young men who receive service are only liable to a very short initial training, after which they pass at once into the territorial army. But if a teacher abandons that calling before the age of 28, he becomes liable, without lot, to two years with the colours, unless he adopts the alternative of volunteering permanently.

Officers are obtained in two ways. There are six local preparatory cadet schools (yonen-gakko) in various parts of the empire, for Officers, boys of from 13 to 15. After 3 years at one of these schools the pupil passes to the central preparatory school (chuo-yonen-gakko), Tokyo, and if he graduates with sufficient credit at the latter institution, he becomes eligible for admission to the officers’ college (shikan-gakko) without further test of proficiency. The second method of obtaining officers is by competitive examination for direct admission to the officers’ college. In either case the cadet is sent to serve with the colours for 6 to 12 months as a private and non-commissioned officer, before commencing his studies. The training of the officers’ college lasts for 3 years, and the period of service at the officers’ college is one year, and after graduating successfully the cadet serves with troops for 6 months on probation. If at the end of that time he is favourably reported on, he is commissioned as a second-lieutenant, and on passing a preliminary examination of artillery undergoes a year’s further training at a special college. Officers are of the same rank as in the British army, but the nomenclature is more simple. The terms, with their English equivalents, are shi (second lieutenant), chai (first lieutenant), tai (captain), shōsō (major), chikun (lieutenant-colonel), shō-hō (major-general), tsūshō (lieutenant-general), gennī (field-marshal). All the grades except the last apply to the same relative ranks in the navy. Promotion of officers in the senior grades is by seniority or merit, but after promotion to the rank of major the candidate must pass a competitive examination, and officers never rise higher than captain, in which case retirement is compulsory at the age of 48. Except in the highest ranks, a certain minimum period has to be spent in each rank before promotion to the next higher grade.

There are three grades of privates: upper soldiers (jūhe-kei), first-class soldiers (tō-otsu), and second-class soldiers (nī-otsu). A private on joining is a second-class soldier. For the first two grades of rank there are regulations for military uniform and equipment, and the same may be claimed after 2 years’ colour service.

The emperor is the commander-in-chief of the army, and theoretically the sole source of military authority, which he exercises through a general staff and a war department, with the assistance of a board of officers appointed by and responsible to him. The board of officers consists of field marshals, and vice-field marshals, and for chief of general or lieutenant-general. It includes besides the usual general staff departments, various survey and topographical officers, and the military college is under its direction. The term of office of the board is indeterminate, and the members are appointed from an active list, who is a member of the cabinet without being necessarily affected by ministerial changes. There are, further, artillery and engineer committees, and a remount bureau. The headquarters of the three regiments of the main army are at Kyoto, Osaka, and Nagoya. The main army is divided into three military districts—eastern, central, and western—each under the command of a general or lieutenant-general. The divisional headquarters are at Osaka, Kyoto, Tokyo, and Nagoya. The army is divided into 101 regiments of cavalry, and 72 field regiments of artillery, and 477 combat regiments; 30 field artillery regiments each of 6 and 3 mountain artillery regiments each of 3 batteries; 6 regiments and 6 battalions of siege, heavy field and fortress artillery; 20 battalions engineers; 66 and 58 naval regiments respectively.

The medical service is exceptionally well organized. It received unstinted praise from European and American experts who observed it closely during the wars of 1904 and 1904-5. The establishment of surgeons to each division is approximately the same, and the arrangements are made for all lines of medical assistance. Much help is rendered by the red cross society of Japan, which has an income of 2,000,000 yen annually, a fine hospital in Tokio, a large nursing staff and two volunteer and civil hospitals built and equipped. During the early part of the campaign in Pechili, in 1906, the French column entrusted its wounded to the care of the Japanese.

The staple article of commissariat for a Japanese army in the field is kō (rice), and occasionally, when food is short, meat is eaten with a relish of salted fish, dried sea-vegetable or pickled plums. The task of provisioning an army on these lines is comparatively simple. The Japanese soldier, though low in stature and well set up, muscular and hardy. He has great powers of endurance, and the makeup and discipline of soldiers, anything at the run, but the soldier is not a final project. For a length of time aching to European, and possibly even to the emperor, he is, however, to attacks of kake (beri-beri), and if he has recourse to meat diet, which appears to be the best preventive, he will probably lose some of his capacity for prolonged rapid movement. He is taught to eat with relish, and has no cause to complain, he conserves his cheerfulness amid hardships, is splendidly patriotic and has always shown himself thoroughly amenable to discipline.

Of the many educational and training establishments, the most important are the military schools. There are, for instance, at Hiroshima, the Imperial Cadet School (Itako), and at Tokyo, Imperial Military College and the Imperial Military Academy. The former is attended chiefly by subaltern officers of dismounted branches, non-commissioned officers also being allowed to take the musketry course. The term of training is five months. Young officers of the scientific and technical branches attend the latter institution (artillery and engineers). There are, further, two special schools of gunnery—one for field, the other for garrison artillery, attended chiefly by captains and senior subalterns of the two branches. There is an inspection of the army, which is raised in three classes: a general being a lieutenant-general, under whom are fifteen field and general officers, who act as inspectors of the various schools and colleges and of military educational matters in general.

The Japanese officer’s pay is small and his mode of life frugal. He lives with his family in barracks which belong to his own family. His uniform is plain and inexpensive, and he has no desire to exchange it for anything at all. He has no mess expenses, contribution to a bank, or luxuries of any kind, and as he is nearly always without means to supplement his pay, his habits are thoroughly economical. He devotes himself absolutely to his profession, living for nothing else, and since he is strongly imbued with the effective conception of the value of his profession, the officer is driven by the conception to the honour of his class, instances of his incurring disgrace by debt or immorality being exceptional. The samurai may be said to have revived in the officers of the modern army, who preserve and act up to all the old traditions. The system of promotion has evidently much to do with this good result, for no Japanese officer can hope to be promoted to a high rank unless he is really zealous and capable, he obtains from his commanding officer the recommendation without which all higher educational opportunities are closed to him. Yet promotion by merit has not degenerated into an empty ostentation, and officers are often kept absent. In the stormiest days of parliamentary warfare, when charges of dishonesty were freely preferred by party politicians against all departments of officialdom, no whisper ever impeached the integrity of the Yedo officers.

The training of the troops is thorough and strictly progressive, the responsibility of the company, squadron and battery commanders for the training of their commands, and the latitude granted them in choice of means being, as in Germany, the keystone of the system.

Originally the government engaged French officers to assist in

1 Conscription without lot is thus the punishment for all failures to comply with and attempts to evade the military laws.

2 Sons of officers’ widows, or officers in reduced circumstances, are educated at these schools either free or at reduced charges, but are required to complete the course and to graduate.

3 Uniform does not vary according to regiments or divisions. There is only one type for the whole of the infantry, one for the cavalry, and so on (see Uniforms, Naval and Military). Officers largely retain their uniforms and equipment, as well as their books and technical literature throughout. The kari-no-ka, which is a combined officers’ club, benefit society and co-operative trading association to which nearly all belong.
organizing the army and elaborating its system of tactics and strategy, and during several years a military mission of French officers resided in Tokyō and rendered valuable aid to the Japanese. Afterwards German officers were employed, and in 1871 it was decided to employ Englishmen, and they left a perpetually grateful memory. But ultimately the services of foreigners were dispensed with altogether, and Japan now adopts the plan of sending picked men to complete their studies in Europe. The first, in 1870, to follow this plan in military schools, was almost implicitly, but since then, having the experience of her own great war to guide her, she has, instead of modelling herself on any one foreign system, chosen from each whatever seemed most desirable, and has thus created a system of her own with an initiative and original character.

When the power of the sword was nominally restored to the Imperial government in 1868, the latter planned to devote one-fourth of the state’s ordinary revenue to the army and navy. Had this plan been realised this would have amounted to a sum of about 3 million sterling for the two services. But not until 1871, when the troops of the fleet were finally disbanded, did the government find itself in a position to include in the annual budget an adequate appropriation on account of armaments. Thenceforth, from 1872 to 1896, the ordinary expenditures of the army varied from three-quarters of a million sterling to £1 million, and the extraordinary outlays ranged from a few pounds to a quarter of a million. Not once in the whole period of 25 years was the state’s total expenditure on the army exceeded 1½ million sterling, and it redounds to the credit of Japan’s financial management that she was able to organize, equip and maintain such a force at a very small cost. In the first year, when she doubled her army, and a proportionate increase of expenditure ensued, the outlays for maintenance jumped at once from an average of about 1½ million sterling to £3 million, and growing thenceforth with the expansion of the military establishment and the commencement of the war, so that when Japan was preparing to break the record the outbreak of war with Russia, they reached the figure of £5 million. Then again, in 1906, six divisions were added, and additional expenses had to be incurred on account of the new overseas garrisons, so that, in 1909, the ordinary outlays reached nearly 7 million, or about one-seventh of the ordinary revenue of the state. This takes no account of extraordinary outlays incurred for building forts and barracks, providing new patterns of equipment, &c. In 1909, the Japanese navy was estimated at £1,871,000, of which £381,000 was spent in the Russian War, and in particular the field artillery guns (which was in 1905 only a semi-quickfire), involved a relatively large outlay.

The navy.—The traditions of Japan suggest that the art of navigation was not unfamiliar to the inhabitants of a country consisting of hundreds of islands and abounding in bays and inlets. Some interpreters of her cosmography discover a great ship in the “floating bridge vessels” of heaven from which the divine progenitors of the islands commenced their work, and construe in a similar sense other poetically named vehicles of that remote age. But though the seas were certainly traversed by the early invaders of Japan, and though there is plenty of proof that in medieval times the Japanese flag floated over merchantmen which voyaged as far as Siam and India, and over piratical craft which harassed the coasts of Korea and China, it is unquestionable that in the matter of naval architecture Japan fell behind even her next-door neighbours. Thus, when a Mongol fleet came to Kiushiu in the 13th century, Japan had no vessels capable of contending against the invaders, and when, at the close of the 16th century, a Japanese army was fighting in Korea, repeated defeats of Japan’s squadrons by Korean war-junks decided the fate of the combatants as well as on sea. It was a state of things that an enterprising nation like the Japanese should not have taken for models the great galleons which visited the Far East in the second half of the 16th century under the flags of Spain, Portugal, Holland and England. With the exception, however, of two ships built by a castaway English pilot to order of Ieyasu, no effort in that direction appears to have been made, and when an edict vetoing the construction of sea-going vessels was issued in 1636 as part of the Tokugawa policy of isolation, it can scarcely be said to have checked the growth of Japan’s navy, for she possessed nothing worthy of the name. It was to the object lesson furnished by the American ships which visited Yedo bay in 1853 and to the urgent counsels of the Dutch that Japan owed the inception of a naval policy. A seamen’s training station was opened under Dutch instructors in 1855 at Nagasaki, a building-ship was constructed and an iron factory established at the same place, and shortly afterwards a naval school was organized at Tsukiji in Yedo, a war-ship the “Kwanko Maru” — presented by the Dutch to the shōgun’s government — being used for exercising the cadets. To this vessel two others, purchased from the Dutch, were added in 1857 and 1858, and these, with one given by Queen Victoria, formed the nucleus of Japan’s navy. In 1860, we find the Pacific crossed for the first time by a Japanese war-ship — the “Kwrin Maru” — and subsequently some young officers were sent to Holland for instruction in naval science. In fact the Tokugawa statesmen had now thoroughly appreciated the imperative need of a navy. Thus, in spite of domestic unrest which menaced the very existence of the Yedo government, a dock-yard was established and fully equipped, the place chosen as its site being, by a strange coincidence, the village of Yokusuka where Japan’s first foreign ship-builder, Will Adams, had lived and died 250 years previously. This dockyard was planned and its construction superintended by a Frenchman, M. Bertin. But although the Dutch had been the first to advise Japan’s acquisition of a navy, and although French aid was sought in the case of the important and costly work at Yokusuka, the shōgun’s government turned to England for teachers of the more modern time warfare. Captain Tracey, R.N., and other British officers and warrant-officers were engaged to organize and superintend the school at Tsukiji. They arrived, however, on the eve of the fall of the Tokugawa shōgunate, and as the new administration was not prepared to utilize their services immediately, they returned to England. It is not to be inferred that the Imperial government underrated the importance of organizing a naval force. One of the earliest Imperial rescripts ranked a navy among “the country’s most urgent needs” and ordered that it should be “at once placed on a firm foundation.” But during the four years immediately subsequent to the restoration, a semi-interregnum existed in military affairs, the power of the sword being partly transferred to the hands of the sovereign and partly retained by the feudal chiefs. Ultimately, not only the vessels which had been in the possession of the shōgunate but also several obtained from Europe by the great feudalatories had to be taken over by the Imperial government, which, on reviewing the situation, found itself owner of a motley squadron of 17 war-ships aggregating 13,812 tons displacement, of which two were armoured, one was a composite ship, and the rest were of wood. Steps were now taken to establish and equip a suitable naval college in Tsukiji, and application having been made to the British government for instructors, a second naval mission was sent from England in 1873, consisting of 30 officers and warrant-officers under Commander (afterwards Vice-Admiral Sir) Archibald Douglas. At the very outset occasions for active service afloat presented themselves. In 1868, the year after the fall of the shōgunate, such ships as could be assembled had to be sent to Yezo to attack the main part of the Tokugawa squadron which had raised the flag of revolt and retired to Hakodate under the command of the shōgun’s admiral, Enomoto. Then in 1874 the duty of convoying a fleet of transports to Formosa had to be undertaken; and in 1877 sea power played its part in crushing the formidable rebellion in Satsuma. Meanwhile the work of increasing and organizing the navy was only slowly going on. The first steam war-ship constructed in Japan had been a gunboat (138 tons) launched in 1866 from a building-yard established at Ishikawajima, an island near the mouth of the Sumida river on which Tokyō stands. At this yard and at Yokusuka two vessels of 807 tons and 1450 tons, respectively, were launched in 1875 and 1876, and Japan now found herself competent not only to execute all repairs but also to build ships of considerable size. An order was placed in England in 1875, which produced, three years later, the “Fusō,” Japan’s first ironclad (3717 tons) and the “Kongo” and “Hiei,” steel-frame sister-cruisers of 2248 tons. Meanwhile training, practical and theoretical, in seamanship, gunnery, torpedo-practice and naval architecture went on vigorously, and in 1878 the Japanese flag was for the first time seen in European waters.
floated over the cruiser "Seiki" (1897 tons) built in Japan and navigated solely by Japanese. The government, constantly solicitous of increasing the fleet, inaugurated, in 1883, a programme of 30 cruisers and 12 torpedo-boats, and in 1886 this was extended, funds being obtained by an issue of naval loan-bonds. But the fleet did not yet include a single battleship. When the diet opened for the first time in 1890, a plan for the construction of two battleships encountered stubborn opposition in the lower house, where the majority attached much less importance to voting money for war-ships than to reducing the land tax. Not until 1892 was this opposition overcome in deference to an order from the throne that thirty thousand pounds sterling should be contributed yearly from the privy purse and that a tithe of all official salaries should be devoted during the same interval to naval needs. Had the house been more prescient, Japan's position at the outbreak of war with China in 1894 would have been very different. She entered the contest with 28 fighting craft, aggregating 57,600 tons, and 24 torpedo-boats, but among them the most powerful was a belted cruiser of 4300 tons. Not one battleship was included, whereas China had two ironclads of nearly 8000 tons each. Under these conditions the result of the naval conflict was awaited with much anxiety in Japan. But the Chinese suffered signal defeats (see CHINO-JAPANESE War) off the Yalu and at Wei-hai-wei, and the victors took possession of 17 Chinese craft, including one battleship. The resulting addition to Japan's fighting force was, however, insignificant. But the naval strength of Japan did not depend on prizes. Battleships and cruisers were ordered and launched in Europe one after the other, and when the Russo-Japanese War (q.v.) came, the fleet promptly asserted its physical and moral superiority in the surprise of Port Arthur, the battle of the 10th of August 1904, and the crowning victory of Tsushima.

As to the development of the navy from 1903 onwards, it is not possible to detail with absolute accuracy the plans laid down by the admiralty in Tokyō, but the actual state of the fleet in the year 1909 will be apparent from the figures given below.

Japan's naval strength at the outbreak of the war with Russia in 1904 was:

<table>
<thead>
<tr>
<th>Number</th>

</table>

To the foregoing must be added two armoured cruisers—the "Kurama" (4,000) launched at Yokosuka in October 1907, and the "Ibuik" (4,700) launched at Kure in November 1907, but no other battleships or cruisers were laid down in Japan or ordered abroad up to the close of 1908.

There are four naval dockyards, namely, at Yokosuka, Kure, Sasebo and Maizuru. Twenty-one vessels built at Yokosuka since 1876 included a battleship (19,000 tons) and twenty-six armoured cruisers (4,000 tons) by 1898 included a battleship (19,000 tons) and an armoured cruiser (4,000 tons). The yards at Sasebo and Maizuru had not yet been used in 1909 for constructing large vessels. Two private yards—Uraga and Nakasaki and Kobe, and the Kawa-saki at the latter place—have built several cruisers, gunboats and torpedo craft, and are competent to undertake more important work. Nevertheless in 1909 Japan did not yet possess complete independence in this matter, for the seven towns and other foreign countries for a part of the steel used in ship-building. Kure manufactures practically all the steel it requires, and there is a government steel-works at Wakamatsu on which more than 3 million tons had been spent in 1909, but it did not yet keep pace with the country's needs. When this independence has been attained, it is hoped to effect an economy of about 18% on the outlay for naval construction, owing to the cheapness of manual labour and the disappearance of both the manufacturer's profit and of the expenses of transfer from Europe to Japan. 

There are five admiralties—Yokosuka, Kure, Sasebo, Maizuru and Port Arthur; and four naval stations—Takeshiki (in Tsushima), Mekong (in the Pescadores), Omintio and Chinhai (in southern Korea).

The navy is manned partly by conscripts and partly by volunteers. About 5000 are taken every year, and the ratio is, approximately, 55% of volunteers and 45% of conscripts. The period of service is 4 years and that of service with the reserve 7 years. On the average 200 cadets are admitted yearly, of whom 50 are engineers, and in 1906 the personnel of the navy consisted of the following:

<table>
<thead>

The highest educational institution for the navy is the naval staff college, in which there are five courses for officers alone. The gannery and torpedo schools are attended by officers, also by selected warrant officers and bluejackets, who consent to extend their service. There is also a mechanical school for junior engineers, warrant-officers and ordinary artificers.

At the naval cadet academy—originally situated in Tokyō but now at Etajima near Kure—ascirsants for service as naval officers receive a 3 years' academic course and 1 year's training at sea; and, finally, there is a naval engineering college collateral to the naval cadet academy.

Since 1883, foreign instruction has been wholly dispensed with in the Japanese navy; since 1886 she has manufactured her own prismatic powder; since 1891 she has been able to make quick-firing guns and Schwarzkopf torpedoes, and in 1892 one of her officers invented a particularly potent explosive, called (after its inventor) Shimose powder.

Finance.—Under the feudal system of the Tokugawa (1603-1871), all land in Japan was regarded as state property, and parcelled out into 276 fees, great and small, which were assigned to as many feudatories. These were empowered to raise revenue for the support of their households, for administrative purposes, and for the maintenance of troops. The basis of taxation varied greatly in different districts, but, at the time of the Restoration in 1867, the general principle was that four-tenths of the gross produce should go to the feudatory, six-tenths to the farmer. In practice this rule was applied to the rice crop only, the assessments for other kinds of produce being levied partly in money and partly in manufactured goods. Forced labour also was exacted, and artisans and traders were subjected to pecuniary levies. The yield of rice in 1867 was about 154 million bushels,1 of which the market value at prices then ruling was £24,000,000, or

1 The reader should be warned that absolute accuracy cannot be claimed for statistics compiled before the Meiji era.
420,000,000 yen. Hence the grain tax represented, at the lowest calculation, 96,000,000 yen. When the administration reverted to the emperor in 1867 the central treasury was empty, and the funds hitherto employed for governmental purposes in the fiefs continued to be devoted to the support of the feudalatories, to the payment of the samurai, and to defraying the expenses of local administration, the central treasury receiving only whatever might remain after these various outlays.

The shōgun himself, whose income amounted to about £1,500,000, did not, on abdicating, hand over to the sovereign either the contents of his treasury or the lands from which he derived his revenues. He contended that funds for the government of the nation as a whole should be levied from the people at large. Not until 1871 did the feudal system cease to exist. The fiefs being then converted into prefectures, their revenues became an asset of the central treasury, less 10% allotted for the support of the former feudalatories.5

But during the interval between 1867 and 1871, the men on whom had devolved the direction of national affairs saw no relief from crippling impecuniosity except an issue of paper money. This was not a novelty in Japan. Paper money had been known to the people since the middle of the 17th century, and in the era of which we are now writing no less than 1694 varieties of notes were in circulation. There were gold notes, silver notes, cash-notes, rice-notes, umbrella-notes, ribbon-notes, late-article-notes, and so on through an innumerable list, the circulation of each kind being limited to the issuing fief. Many of these notes had almost ceased to have any purchasing power, and nearly all were regarded by the people as evidences of official greed. The first duty of a centralized progressive administration should have been to reform the currency. The political leaders of the time appreciated that duty, but saw themselves compelled by stress of circumstances to adopt the very device which in the hands of the feudal chiefs had produced such deplorable results. The total amount of these was about £3,000,000 yen, while the extraordinary aggregated 29,000,000 yen, and was derived wholly from issues of paper money or other equally unsound sources.

Even on the abolition of feudalism in 1871 the situation was not immediately relieved. The land tax, which constituted one-tenth of the feudal revenues, had been assessed by varying methods and at various rates by the different feudalatories, and re-assessment of all the land became a preliminary essential to establishing a uniform system. Such a task, on the basis of accurate surveys, would have involved years of work, whereas the financial needs of the state had to be met immediately. Under the pressure of this imperative necessity a re-assessment was roughly made in two years, and being continued thereafter with greater accuracy, was completed in 1881. This survey, eminently liberal to the agriculturists, assigned a value of 1,500,000,000 yen to the whole of the arable land, and the treasury fixed the tax at 3% of the assessed value of the land, which was about one-half of the real market value. Moreover, the government contemplated a gradual reduction of this already low impost until it should ultimately fall to 1%. Circumstances prevented the consummation of that purpose. The rate underwent only one reduction of ½%, and thereafter had to be raised on account of war expenditures. On the whole, however, no class benefited more conspicuously from the change of administration than the peasants, since not only was their burden of taxation light, but also they were converted from mere tenants into actual proprietors. In brief, they acquired the fee-simple of their farms in consideration of paying an annual rent equal to about one sixty-sixth of the market value of the land.

In 1873, when these changes were effected, the ordinary

1 The yen is a silver coin worth about 28.110 yen = $1.
2 In addition to the above, the fiefs were, however, allowed to retain the reserves in their treasuries; thus many of the feudal nobles found themselves possessed of substantial fortunes, a considerable part of which they generally devoted to the support of their former vassals.

State Revenue.

Revenue of the state rose from 24,500,000 yen to 70,500,000 yen. But seven millions sterling is a small income for a country confronted by such problems as Japan had to solve. She had to build railways; to create an army and a navy; to organize posts, telegraphs, prisons, police and education; to construct roads, improve harbours, light and buoy the coasts; to create a mercantile marine; to start under official auspices numerous industrial enterprises which should serve as object lessons to the people, as well as to lend to private persons large sums in aid of similar projects. Thus, living of necessity beyond its income, the government had recourse to further issues of fiduciary notes, and in proportion as the volume of the latter exceeded actual currency requirements their specie value depreciated.

This question of paper currency inaugurates the story of banking; a story on almost every page of which are to be found inscribed the names of Prince Itō, Marquis Inouye, Marquis Matsukata, Count Okuma and Baron Shibusawa, the fathers of their country’s economic and financial progress in modern times. The only substitutes for banks in feudal days were a few private firms—“households” would, perhaps, be a more correct expression—which received local taxes in kind, converted them into money, paid the proceeds to the central government or to the feudalatories, gave accommodation to officials, did some exchange business, and occasionally extended accommodation to private individuals. They were not banks in the Occidental sense, for they neither collected funds by receiving deposits nor distributed capital by making loans. The various fiefs were so isolated that neither social nor financial intercourse was possible, and moreover the mercantile and manufacturing classes were regarded with some disdain by the gentry. The people had never been familiarized with combinations of capital for productive purposes, and such a thing as a joint-stock company was unknown. In these circumstances, when the administration of state affairs fell into the hands of these feudalatories, they not only lacked the first essential of rule, money, but were also without means of obtaining any, for they could not collect taxes in the fiefs, these being still under the control of the feudal barons; and in the absence of widely organized commerce or finance, no access to funds presented itself. Doubtless the minds of these men were sharpened by the necessities confronting them, yet it speaks eloquently for their discernment that, samurai as they were, without any business training whatever, one of their first essays was to establish organizations which should take charge of the national revenue, encourage industry and promote trade and production by lending money at comparatively low rates of interest. The tentative character of these attempts is evidenced by frequent changes. There was first a business bureau, then a trade bureau, then commercial companies, and then exchange companies, these last being established in the principal cities and at the open ports, their personnel consisting of the three great families—Mitsui, Shimadzu and Ono—houses of ancient repute, as well as other wealthy merchants in Kioto, Osaka and elsewhere. These exchange companies were partnerships, though not strictly of the joint-stock kind. They formed the nucleus of banks in Japan, and their functions included, for the first time, the receiving of deposits and the lending of money to merchants and manufacturers. They had power to issue notes, and, at the same time, the government issued notes on its own account. Indeed, in this latter fact is to be found one of the motives for organizing the exchange companies, the idea being that if the state’s notes were lent to the companies, the people would become familiarized with the use of such currency, and the companies would find them convenient capital. But this system was essentially unsound: the notes, alike of the treasury and of the companies, though nominally convertible, were not secured by any fixed stock of specie. Four years sufficed to prove the impracticability of such an arrangement, and in 1872 the exchange companies were swept away, to be succeeded in July 1873 by the establishment of national banks on a system which combined some of the features of English banking with the general
bases of American. Each bank had to pay into the treasury 60% of its capital in government notes. It was credited in return with interest-bearing bonds, which bonds were to be left in the treasury as security for the issue of bank-notes to an equal amount, the banks being required to keep in gold the remaining 40% of their capital as a fund for converting the notes, which conversion must always be effected on application. The elaborators of this program were Ito, Inouye, Okuma and Shibasawa. They added a provision designed to prevent the establishment of too small banks, namely, that the capital of each bank must bear a fixed ratio to the population of its place of business. Evidently the main object of the treasury was gradually to replace its own flat paper with convertible bank-notes. But experience quickly proved that the scheme was unworkable. The treasury notes had been issued in such large volume that sharp depreciation had ensued; gold could not be procured except at a heavy cost, and the balance of foreign trade being against Japan, some 300,000,000 yen in specie flowed out of the country between 1872 and 1874.

It should be noted that at this time foreign trade was still invaded with much of the gold in Japanese hands. In early days, while the Dutch had free access to her ports, they sold her so much and bought so little in return that an immense quantity of the precious metals flowed out of her coffers. Again, when over-sea trade was resumed under the auspices of the London Convention of 1854, Japan was presented to foreigners an opportunity of which they did not fail to take full advantage. For, during her long centuries of seclusion, gold had come to hold such a coinage ratio of 1 to 8, so that they received but one-eighth of the silver it had cost them. But this ratio was changed and, while the banks were required to issue an equal quantity of its own notes, the West. On the other hand, the treaty gave foreign traders the right to exchange their own silver coins against Japanese, weight for weight, and thus it fell out that the foreigner, going to Japan with three dollars in his pocket, parted with two and a half Spanish dollars, and was left with only one and a half as much silver as he had cost in Mexico. Japan lost very heavily by this system, and the result of the treaty was that the Japanese people were now in a more precarious position than ever before; no deposits came to the aid of the banks, nor did the public make any use of them. Disaster became inevitable. The two great firms of Ono and Shimada, which had stood high in the nation's estimation alike as manufacturers and as financiers, found their doors in 1872 and 1874, the fact created undue consternation, and moreover there can be no doubt that the drafters of the bank regulations had over-estimated the quantity of available gold in the country.

All these things made it impossible to keep the bank-notes long in circulation, and they were soon resuming their worth again; no deposits came to the aid of the banks, nor did the public make any use of them. Disaster became inevitable. The two great firms of Ono and Shimada, which had stood high in the nation's estimation alike as manufacturers and as financiers, found their doors in 1872 and 1874, the fact created undue consternation, and moreover there can be no doubt that the drafters of the bank regulations had over-estimated the quantity of available gold in the country.

Evidently the banking system must be changed. The government bowed to necessity. They issued a revised code of banking regulations, they substituted a central bank for the old fiduciary system, and provided for the issue of specie. Each bank was thenceforth to be required to issue 80% of its capital in 6% state bonds, and these being lodged with the treasury, the bank became entitled to issue an equal amount of its own notes. The banks had to bear one-half of the cost of the speculative loans, Japan held on a gold standard, and a floating debt was incurred.

For bond-holders, combining to form a bank, continued to draw from the treasury 6% on their bonds, while they acquired power to issue a corresponding amount of notes which could be lent at profit.

A bank note thus became a medium of exchange, and not a mere piece of paper. This method of securing a reserve of specie. Something like a mania for bank-organizing declared itself, and in 1878 the government deemed it necessary to legislate against the establishment of any more national banks, and to limit the amount of 300,000,000 yen the aggregate note issues of those already in existence.

It is possible that the conditions which prevailed immediately after the establishment of the national banks might have developed into a permanent preoccupation of the Satsuma rebellion broken out in 1877. Increased taxation to meet military outlay being impossible in such circumstances, nothing offered except recourse to further note issues. The result was that by 1881, fourteen years after the Restoration, notes whose face value aggregated 164,000,000 yen had been put into circulation; the treasury possessed specie amounting to only 8,000,000 yen, and 18 paper yen could be purchased with 10 specie yen.

Up to 1881 futile efforts had been made to strengthen the specie value of flat paper by throwing quantities of gold and silver upon the market from time to time, and 23,000,000 yen had been expended in this effort. Devoted to the purchase of Japanese currency on the one hand, and accumulating a specie reserve on the other. The steps of the programme were simple. By cutting down administrative expenditure; by transferring certain charges from the treasury to the local communies; by suspending payments in gold and silver to foreign governments, and by a moderate increase of the tax on alcohol, an annual surplus of revenue, totalling 7,500,000 yen, was secured. This was applied to reducing the volume of the notes in circulation.

Before this series of measures the large-scale redemption of industrial and agricultural works should be sold—since their purpose of instruction and example seemed now to have been sufficiently achieved—and the proceeds, together with various securities (aggregating 30,000,000 yen in face value) which were then in the hands of the government, were applied to the purchase of specie. Had the government entered the market openly as a seller of its own fiduciary notes, its credit may have suffered. There were also ample reasons to doubt whether any considerable amount of specie could be bought with the specie tax on alcohol, the cheap money had steadily driven out the dead and, although the government mint at Osaka, founded in 1871, had struck gold and silver coins worth 15,000,000 yen, the proceeds were unworkable. But the use of a secondary bank—the present Specie Bank of Yokohama—the former to conduct transactions with native producers and manufacturers, the latter to finance the business of exporting. The outcome of these actions was that the volume of fiduciary notes had been reduced to 116,000,000 yen, their depreciation had fallen to 3% and the metallic reserve of the treasury had increased to 45,000,000 yen. The resumption of specie in 1876 of 26,000,000 yen in face value held by the treasury, by the end of the year, an accomplished fact. From the time when this programme began to be effective, Japan entered a period of favourable balance of trade. According to accepted economic theories, the influence of the law of demand and supply on such a state of things was to be to reduce the rise in the price of specie. But a reaction in the case of Japan's case, for from 1882 her exports annually exceeded her imports, the maximum excess being reached in 1886, the very year after the resumption of specie payments.

Thus the speculative and fiduciary debts of Japanese finance, not merely because they set forth a fine economic fact, indicating clear insight, good organizing capacity, and courageous energy, but also because volumes of adverse foreign criticism were written against the majority of Japanese economists, it embodies. Now Japan was charged with robbing her own people because she bought their goods with paper money and sold them for specie; again, she was accused of an official conspiracy to ruin the foreign debtors and to defraud the foreigners. The truth was that Japan did not defraud America and America at rates that defined ordinary competition; while some declared that she was plainly without any understanding of her own doings, others predicted that her heroic method of dealing with the problem of currency would produce widespread suffering. Undoubtedly, to carry the currency of a nation from a discount of 70 or 80% to par in the course of four years, reducing its value at the same time from 160 to 119 million yen, was a financial enterprise violent and daring almost to rationality. The general theory of the crisis had been at an end, and the emphasis had been turned to the problem of its prevention. The question of specie reserves has been dealt with more seriously. The Japanese government has been more consistent and not only has it been careful to maintain a reserve but has in the name of the new currency. It is evident that the government has a well-defined purpose in view, but it is not to be inferred that it is consistent with any demand it may make.
to restore Japan's judicial and tariff autonomy. The example of Egypt showed what kind of fate might overtake a semi-independent state falling into the clutches of foreign bond-holders. Japan did not wish to fetter herself with foreign debts while struggling to emerge from semi-colonialism.

After the revision of the national bank regulations, semi-official banking enterprise won such favour in public eyes that the government found it necessary to impose limits. This was done by consolidating a large number of Japan's private banks and building a sort of virtual central bank, a state bank, and 90 or more semi-official banking corporations, so that, by the year 1883, no less than 109 banking institutions were in existence throughout Japan with an aggregate capital of 900,000,000 yen. At this juncture the government decided to give the new state bank the right to issue currency, thus converting it into a quasi-central bank.

Closings

of

the

National

Banks

In 1886, the initiative to establish a state bank was put into effect. The government, then stronger in its resolve than before, decided to form a state bank, conferring the right to issue currency on itself. The operations of this new bank were quite successful, but the government eventually decided to terminate the activities of the state bank in 1906.

Clearing

Houses

Exchanges existed in Japan as far back as the close of the 17th century. At that time the income of the feudal chiefs consisted almost entirely of rice, and as this was sold to brokers, brokers' houses called "Mita" were set up in all the principal cities and places for conducting their business. Originally their transactions were all for cash, but afterwards they devised time bargains which ultimately developed into a definite form of exchange. The term "Meiji Clearing House", used in this connection ever since, is derived from the name of the government, which in 1872 appointed one in each city for the purpose of clearing bills of exchange.

Government

Banking

and

Economic

Development

The government was anxious to support the establishment of state banks and other financial institutions, and to promote the development of Japan's national economy; this was the true spirit of Meiji. Meiji's economic development was accompanied by a development of insurance business. The beginnings of this kind of enterprise did not become visible, however, until 1881, and even at that comparatively late date the number of insurance companies was but small, and the control of such operations was in the hands of the government. The commercial code, published in March 1890, was the earliest legislation which met the need, and from that time the number of insurance companies and the volume of their transactions rapidly increased, so that by 1900 the paid-up capital of 70,000,000 yen and policies aggregating 971,000,000 yen, and in 1906 the corresponding figures were 65 companies, 22,000,000 yen paid up and policies of 41,490,000 yen. The net profits of these companies in 1906 were in round numbers 10,000,000 yen.

1 The Bank of Japan was established as a joint-stock company in 1882. The capital in 1900 was 30,000,000 yen. In it alone there was one savings bank in 1867, there were 487 in 1906 with deposits of over 500,000,000 yen. The average yearly dividends of these banks in the ten years ending 1906 varied between the 9-1 and 9.9 per cent.

Insurance.
paper-making, oil-refining, brick-making, leather-tanning, glass-making and other industries attracted eager attention, and whereas the capital subscribed for such works aggregated only 50,000,000 yen in 1886, it exceeded 1,000,000,000 yen in 1906. When specific payments were resumed in 1886, the notes issued by the Bank of Japan were convertible into silver on demand, the silver standard being thus definitely adopted, a complete reversal of the system inaugurated at the establishment of the national banks on Prince Itō’s return from the United States. Japanese financiers believed from the outset in gold monometallism. But, in the first place, the country’s stock of gold was soon driven out by her depreciated fiat currency; and, in the second, not only were all other Oriental nations using silver, but also the Mexican silver had long been the unit of account in Far-Eastern trade. Thus Japan ultimately drifted into silver monometallism, the silver yen becoming her unit of currency. So soon, however, as the indemnity that she received from China after the war of 1894–95 had placed her in possession of a stock of gold, she determined to revert to the gold standard. Mechanically speaking, the operation was very easy. Gold having appreciated so that its value in terms of silver had exactly doubled during the first 30 years of the Meiji era, nothing was necessary to change the denominations of the silver coins in terms of yen, leaving the silver subsidiary coins unchanged. Thus the old 5-yen gold piece, weighing 2.2222 troy ounces of 900 fineness, became a 10-yen piece in the new currency, and a new 5-yen piece of half the weight was coined. No change whatever was required in the reckonings of the people. The yen continued to be their coin of account, with a fixed sterling value of a small fraction over two shillings, and the denominations of the gold coins were doubled. Gold, however, is little seen in Japan; the whole duty of currency is done by notes.

It is not to be supposed that all this economic and financial development was unchequered by periods of depression and severe panic. There were in fact six such seasons: in 1874, 1891, 1887, 1897, 1900, and 1907. But no year throughout the whole period failed to witness an increase in the number of Japan’s industrial and commercial companies, and in the amount of capital thus invested.

To obtain a comprehensive idea of Japan’s state finance, the simplest method is to set down the annual revenue at quinquennial periods, commencing with the year 1878–79, because it was not until 1876 that the system of duly compiled and published budgets came into existence.

**Revenue** (omitting fractions)

<table>
<thead>
<tr>
<th>Year</th>
<th>Ordinary Revenue (millions of yen)</th>
<th>Extraordinary Revenue (millions of yen)</th>
<th>Total Revenue (millions of yen)</th>
</tr>
</thead>

</tr>
<tr>
<td>1910–9</td>
<td>476</td>
<td>144</td>
<td>620</td>
</tr>
</tbody>
</table>

The most striking feature of the above table is the rapid growth of revenue during the last three periods. So signal was the growth that the revenue may be said to have sextupled in the 15 years ending 1909. This was due to the great extent to which Japan was involved, that is China in 1894–95 and that with Russia in 1904–5. The details will be presently shown.

Turning now to the expenditure and pursuing the same plan, we have the following figures:

<table>
<thead>
<tr>
<th>Year</th>
<th>Ordinary Expenditure (millions of yen)</th>
<th>Extraordinary Expenditure (millions of yen)</th>
<th>Total Expenditure (millions of yen)</th>
</tr>
</thead>
<tbody>
<tr>

<td>250</td>
</tr>
<tr>
<td>1909–10</td>
<td>427</td>
<td>193</td>
<td>620</td>
</tr>
</tbody>
</table>

It may be here stated, with three exceptions, the working of the budget showed a surplus in every one of the 41 years between 1867 and 1908.

---

1 The Japanese fiscal year is from April 1 to March 31.

The sources from which revenue is obtained are as follows:

**Ordinary Revenue**

<table>
<thead>

</tbody>
</table>

It appears from the above that during 15 years the weight of taxation increased fourfold. But a correction has to be applied, first, on account of the tax on alcoholic liquors and, secondly, on account of customs dues, neither of which can properly be considered general imposts. The former grew from 16 millions in 1894–95 to 72 millions in 1908–9, and the latter from 81 millions to 414 millions. If these increases be deducted, it is found that taxes, properly so called, grew from 70–5 millions in 1894–95 to 207–8 millions in 1908–9, an increase of somewhat less than three-fold. Otherwise stated, the burden per head in 1894–95 was 3.6d., whereas in 1908–9 it was 8s. 4d. To understand the principle of Japanese taxation and the manner in which the above development took place, it is necessary to glance briefly at the chief, taxes separately.

The land tax is the principal source of revenue. It was originally fixed at 3% of the assessed value of the land, but in 1877 this ratio was reduced to 2½% on basis the tax yielded from 37 to 38 million yen annually. After the war with China (1894–95) the government proposed to impose this impost in order to obtain funds for an extensive programme of useful public works and expanded armaments (known subsequently as the "first post bellum programme"). By that time the market value of agricultural land had largely appreciated owing to improved cultivation, and urbanisation, and urbanised goods increased greatly in prices. But the lower house of the diet, consisting itself guardian of the farmers' interests, refused to endorse any increase of the tax. Not until 1889 could this resistance be overcome, and then only on the condition that the tax on property was increased more than 5 times. The amended rates were 3½% on rural lands and 5% on urban building sites. Thus altered, the tax produced 46,000,000 yen, but at the end of the five-year period it would have reverted to its former rate. But, having returned to Russia broken funds, the increase was then made so that the impost varied from 3% to 17½% according to the class of land, and under this new system the tax yielded 85 millions. Thus the exigencies of two wars had augmented its five millions in 1894–95 to 85 millions in the budget for 1908–9.

The income tax was introduced in 1887. It was on a graduated scale, varying from 1% on incomes of not less than 300 yen, to 3% on incomes of 30,000 yen and upwards. At these rates the tax yielded an insignificant revenue of about 2,000,000 yen. In 1899, a revision was made for the purposes of the first post bellum programme. This revision increased the number of classes from five to ten, incomes of 300 yen standing at the bottom and incomes of 100,000 yen or upwards at the top, the minimum and maximum rates being 1½% and 4% respectively. There was produced approximately 8,000,000 yen. Finally in 1904, when war broke out with Russia, these rates were again revised, the minimum now becoming 2% and the maximum 6½%. Thus revised, the tax yielded 22,000,000 yen in 1897, but it figured at 22,000,000 yen in the budget for 1908–9.

The above three imposts constitute the only direct taxes in Japan. Among indirect taxes the most important is that upon alcoholic liquors. It was inaugurated in 1871; doubled, roughly speaking, in 1878; still further increased thenceforth at intervals of about 5 years, until it is now approximately twenty times as heavy as it was originally. The liquor taxed is mainly sake; the rate is about 50 yen (one shilling) per gallon, and the annual yield is 72,000,000 yen.

In 1890, when Japan began to take foreign commerce, the customs duties were fixed on a basis of 10% ad valorem, but this was almost immediately changed to a nominal 5% and a real 3%. The customs then yielded a very per cent of the total revenue—three or four million yen—and the Japanese government had no discretionary power to alter the rates. Strenuous efforts to change this system were made at length successful, and in 1899, the tariff was divided into two sections: a reciprocal one, and a composite one; in the former being governed by a treaty valid for 12 years; those in the latter being fixed at Japan’s will. Things remained thus until the war with Russia
compelled a revision of the statutory tariff. Under this system the ratio of the duties to the value of the dutiable goods was about 15–65%. The customs yield a revenue of about 42,000,000 yen.

In addition to the above there are eleven taxes, some in existence before the war of 1894 and some created for the purpose of carrying on the war or to meet the expenses of the Post Tax

**bailment programme.**

Also, as shown above, the land tax was increased by 39 millions; the income tax by 19 millions; the business tax by 15 millions; and the tax on alcoholic liquors by 15 millions. On the whole, these taxes, more especially the income tax, which is one of accidental incidence to be lumped together, it appears that the burden swelled from 160,000,000 yen before the war to 320,000,000 yen after it.

The government of Japan carries on many manufacturing undertakings for purposes of military and naval equipment, for shipbuilding, for the construction of railway rolling stock, for the manufacture of telegraphs and light-house materials, for iron-founding and steel-making, for printing, and so forth. There are 43 government institutions, giving employment to 108,000 male operatives and 23,000 female, together with 63,000 labourers. But the financial results do not appear independently in the general budget. The net proceeds of these establishments, however, constitute important budgetary items: they are, the profits derived from the postal and telegraph services, 39,000,000 yen; secondly, from forests, 13,000,000 yen; and thirdly, from railways, 37,000,000 yen.

The government further exercises a monopoly of three important staples, tobacco, salt and camphor. In each case the crude article is produced by private individuals from whom it is taken over at a fair price by the government, and, having been manufactured (if necessary), is resold by government agents at fixed prices. The tobacco monopoly yields a profit of some 33,000,000 yen; the salt monopoly a profit of 12,000,000 yen, and the camphor monopoly a profit of 7,000,000 yen. Thus the ordinary revenue of the state consisted in 1908–1909—

The ordinary expenditures of the nine departments of state aggregated in 1898–1900, 427,000,000 yen, so that there was a surplus revenue of 49,000,000 yen.

Japan during the long period of 1896 and 1907, because they disclosed the special programmes mapped out by Japanese financiers and statesmen after the wars with China and Russia. Both programs had similar bases—expansion of armament and development of the country's material resources. After her war with China, Japan received a plain intimation that she must either fight again after a few years or resign herself to a career of insignificance on the confines of the Far East. No other intervention than that of the two great European powers—France and inquiring her to retrocede the territory which she had acquired by right of conquest. Japan therefore made provision for the doubling of her army and her navy, for the growth of a material resources, and for the development of resources which should lighten the burden of these outlays.

The war with Russia ensued nine years after these preparations had begun, and Japan emerged victorious. It then seemed to the looking nations that she would rest from her warlike efforts. On the contrary, just as she had behaved after her war with China, so she now behaved after her war with Russia—made arrange-
In the same years the total indebtedness of the corporations was:

The chief purports to which these loans were applied are as follows:

- Education: 5
- Sanitation: 12
- Industries: 13
- Public works: 52

Local corporations are not competent to incur unrestricted indebtedness. The endorsement of the local assembly must be secured; redemption must commence within 3 years after the date of issue and be completed within 30 years; and, except in the case of very small loans, the sanction of the minister of home affairs must be obtained.

Wealth of Japan.—With reference to the wealth of Japan, there is no official census. So far as can be estimated from statistics for the year 1904-1905, the wealth of Japan proper, excluding Formosa, Sakhalin and some rights in Manchuria, amounts to about 19,896,000,000 yen, the items of which are as follows:

<table>
<thead>

Grand total: 19,896,000,000 yen.

Education.—There is no room to doubt that the literature and learning of China and Korea were transported to Japan in very ancient times, but tradition is the sole authority for current statements that in the 3rd century A.D. Korean immigrants were appointed historiographers to the Imperial court of Japan and another learned man from the same country introduced the Japanese to the treasures of Chinese literature. About the end of the 6th century the Japanese began to send civilians and religious men directly to China, where they studied Confucianism and Buddhism, and among these travellers there were some who passed as much as 25 or 30 years beyond the sea.

The knowledge acquired by these students was crystallized into a body of laws and ordinances based on the administrative and legal systems of the Sui dynasty in China, and in the middle of the 7th century the first Japanese school seems to have been established by the emperor Tenchi, followed some 50 years later by the first university. Nara was the site of the latter, and the subjects of study were ethics, law, history and mathematics.

Not until 794, the date of the transfer of the capital to Kioto, however, is there any evidence of educational organization on a considerable scale. A university was then opened in the capital, with affiliated colleges; and local schools were built and endowed by noble families, to whose offices admissitance was restricted, but for general education one institution only appears to have been provided. In this Kioto university the curriculum included the Chinese classics, calligraphy, history, law, etiquette, arithmetic and composition; while in the affiliated colleges special subjects were taught, as medicine, herbalism, acupuncture, shampooing, divination, the almanac and languages. Admission was limited to youths of high social grade; the students aggregated some 400, from 13 to 16 years of age; the faculty included professors and teachers, who were known by the same titles (kabase and shi) as those applied to their successors to-day; and the government supplied food and clothing as well as books. The family schools numbered five, and their patrons were the Wage, the Fujwara, the Tachibana (one school each) and the Minamoto (two). At the one institution—opened in 828—where youths in general might receive instruction, the course included 221 millions of loans raised abroad.

---

1 In this is included a sum of 1,100,000,000 yen distributed in the form of 3% compound interest to the officers and naval corps of the former army and navy by way of reward for their services during the war of 1904-5.
2 When war broke out in 1904 the local administrative districts took steps to reduce their outlays, so that whereas the expenditures totalled 185,000,000 yen in 1903-1904, they fell to 122,000,000 and 126,000,000 yen in 1904-1905 and 1905-1906 respectively. Thereafter, however, they expanded once more.
3 This includes 221 millions of loans raised abroad.
embraced only calligraphy and the precepts of Buddhism and Confucianism.

The above respect suggests that Japan, in those early days, borrowed her educational system and its subjects of study entirely from China. But closer scrutiny shows that the national factor was carefully preserved.

**Combining the Native and Foreign Elements.** The ethics of administration required a combination of two elements, wakon, or the soul of Japan, and kanwai, or the ability of China; so that, while adopting from Confucianism the doctrine of filial piety, the Japanese grafted on it a spirit of unsuavering loyalty and patriotism; and while accepting Buddha's teaching as to three states of existence, they supplemented it by a belief that in the life beyond the grave the duty of guarding his country would devolve on every man. Great academic importance attached to proficiency in literary composition, which demanded close study of the ideographic script, endlessly perplexing in form and infinitely delicate in sense. To be able to compose and indite graceful couplets constituted a passport to high office as well as to the favour of great ladies, for women vied with men in this accomplishment. The early years of the 11th century saw, grouped about the empress Aki, a galaxy of female authors whose writings are still accounted their country's classics—Murasaki no Shikibu, Akazome Emon, Izumi Shikibu, Ise Tairyu and several lesser lights. To the first two Japan owes the *Genji monogatari* and the *Eiga monogatari*, respectively, and from the Imperial court of those remote ages she inherited admirable models of painting, calligraphy, poetry, music, song and dance. But it is to be observed that all this refinement was limited virtually to the noble families residing in Kioto, and that the first object of education in that era was to fit men for office and for society.

Meanwhile, beyond the precincts of the capital there were rapidly growing to maturity numerous powerful military magnates who despised every form of learning that did not contribute to martial excellence. An illiterate era ensued which reached its climax with the establishment of feudalism at the close of the 12th century. It is recorded that, about that time, only one man out of a force of five thousand could decipher an Imperial mandate addressed to them. Kamakura, then the seat of feudal government, was at first distinguished for absence of all intellectual training, but subsequently the course of political events brought thither from Kioto a number of court nobles whose erudition and refinement acted as a potent leaven. Buddhism, too, had become the outset a strong educational influence. Under its auspices the first great public library was established (1279) at the temple Shōmyo-ji in Kanazawa. It is said to have contained practically all the Chinese and Japanese books then existing, and they were open for perusal by every class of reader. To Buddhist priests, also, Japan owed during many years all the machinery she possessed for popular education. They organized schools at the temples scattered about in almost every part of the empire, and at these *tera-kaya*, as they were called, lessons in ethics, calligraphy, reading and etiquette were given to the sons of samurai and even to youths of the mercantile and manufacturing classes.

When, at the beginning of the 17th century, administrative supremacy fell into the hands of the Tokugawa, the illustrious founder of that dynasty of shōguns, Ieyasu, showed himself an earnest promoter of erudition. He employed a number of priests to make copies of Chinese and Japanese books; he patronized men of learning and he endowed schools. It does not appear to have occurred to him, however, that the spread of knowledge was hampered by a restriction which, emanating originally from the Imperial court in Kioto, forbade any one outside the ranks of the Buddhist priesthood to become a public teacher. To his fifth successor Tsunayoshi (1680–1709) was reserved the honour of abolishing this veto. Tsunayoshi, whatever his faults, was profoundly attached to literature. By his command a pocket edition of the Chinese classics was prepared, and the example he himself set in reading and expounding rare books to audiences of feudatories and their vassals produced something like a mania for erudition, so that feudal chiefs competed in engaging teachers and founding schools. The eighth shōgun, Yoshinuné (1716–1749), was an even more enlightened ruler. He caused a geography to be compiled and an astronomical observatory to be constructed; he revoked the veto on the study of foreign books; he conceived and carried out the idea of imparting moral education through the medium of calligraphy by preparing ethical primers whose precepts were embodied in the head-lines of copy-books, and he encouraged private schools. Ienari (1757–1838), the eleventh shōgun, and his immediate successor, Ieyoai (1838–1833), patronized learning no less ardently, and it was under the auspices of the latter that Japan acquired her five classics, the *Prime Words*, of Great Learning, of Lesser Learning, of Female Ethics and of Women's Filial Piety.

Thus it may be said that the system of education progressed steadily throughout the Tokugawa era. From the days of Tsunayoshi the number of schoolsteads steadily increased, and as students were admitted free of all charges, a duty of grateful fealty as well as the impulse of interlief competition drew thither the sons of all samurai. Ultimately the number of such schools rose to over 240, and being supported entirely at the expense of the feudal chiefs, they did not little honour to the spirit of the era. From 7 to 15 years of age lads attended as day scholars, being thereafter admitted as boarders, and twice a year examinations were held in the presence of high officials of the fief. There were also several private schools where the curriculum consisted chiefly of moral philosophy, and there were many temple schools, where ethics, calligraphy, arithmetic, etiquette and, sometimes, commercial matters were taught. A prominent feature of the system was the bond of reverential affection uniting teacher and student. Before entering school a boy was conducted by his father or elder brother to the home of his future teacher, and there the visitors, kneeling before the teacher, pledged themselves to obey him in all things and to submit unquestioningly to any discipline he might impose. Thus the teacher came to be regarded as a parent, and the veneration paid to him was embodied in a precept: "Let not a pupil treading within three feet of his teacher's shadow." In the case of the temple schools the priestly instructor had full cognizance of each student's domestic circumstances and was guided by that knowledge in shaping the course of instruction. The universally underlying principle was, "serve the country and be diligent in your respective avocations." So, the son of a samurai was trained in military arts, and on attaining proficiency many of them travelled about the country, inuring their bodies to every kind of hardship and challenging all experts of local fame.

Unfortunately, however, the policy of national seclusion prevented for a long time all access to the stores of European knowledge. Not until the beginning of the 18th century did any authorized account of the great world of the West pass into the hands of the people. A celebrated scholar (Arai Hakuseki) then compiled two works—Saiyō *kibun* (Record of Occidental Hearsay), and Saizen *igen* (Renderings of Foreign Languages)—which embodied much information, obtained from Dutch sources, about Europe, its conditions and its customs. But of course the light thus furnished had very restricted influence. It was not extinguished, however. Thenceforth men's interest centred more and more on the astronomical, geographical and medical sciences of the West, though such subjects were not included in academical studies until the renewal of foreign intercourse in modern times. Then (1857), almost immediately, the nation turned to Western learning, as it had turned to Chinese thirteen centuries earlier. The Tokugawa government established in Yedo an institution called Banzho-shirabe-dokoro (place for studying foreign books), where Occidental languages were learned and Occidental works translated. Simultaneously a school for acquiring foreign medical art (Seiyō igaku-sho) was opened, and, a little later (1862), the Kaisei-jo (place of liberal culture), a college for studying European sciences, was added to the list of new institutions. Thus the eve of the Restoration saw the
Japanese people already appreciative of the stores of learning rendered accessible to them by contact with the Occident.

Commercial education was comparatively neglected in the schools. Sons of merchants occasionally attended the _tera-koya_, but the instruction they received there had seldom any bearing upon the conduct of trade. Mercantile tile knowledge had to be acquired by a system of apprenticeship. A boy of 9 or 10 was apprenticed for a period of 8 or 9 years to a merchant, who undertook to support him and teach him a trade. Generally this young apprentice could not even read or write. He passed through all the stages of shop menial, errand boy, petty clerk, salesman and senior clerk, and in the evenings he received instruction from a teacher, who used for textbooks the manual of letter-writing (_Shosai orai_) and the manual of commerce (_Shōhō orai_). The latter contained much useful information, and a youth thoroughly versed in its contents was competent to discharge responsible duties.

When an apprentice, having attained the position of senior clerk, had given proof of practical ability, he was often assisted by his master to start business independently, but a firm-name, the same firm-name, for which purpose a sum of capital was given to him or a section of his master's customers were assigned.

When the government of the Restoration came into power, the emperor solemnly announced that the administration should be conducted on the principle of employing men of capacity wherever they could be found. This amounted to a declaration that in choosing officials scholastic acquirements would thenceforth take precedence of the claims of birth, and thus unprecedented importance was seen to attach to education.

But so long as the feudal system survived, even in part, no general scheme of education could be thoroughly enforced, and thus it was not until the conversion of the shōsō into prefectures in 1871 that the government saw itself in a position to take drastic steps. A commission of investigation was sent to Europe and America, and on its return a very elaborate and extensive plan was drawn up in accordance with French models, which the commissioners had found conspicuously complete and symmetrical. This plan subsequently underwent great modifications. It will be sufficient to say that in consideration of the free education hitherto provided by the feudalists in their various fiefs, the government of the restoration resolved not only that the state should henceforth shoulder the main part of this burden, but also that the benefits of the system should be extended equally to all classes of the population, and that the attendance at primary schools should be compulsory. At the outset the sum to be paid by the treasury was fixed at 2,000,000 _yen_, that having been approximately the expenditure incurred by the feudalists. But the financial arrangements suffered many changes from time to time, and finally, in 1877, the cost of maintaining the schools became a charge on the local taxes, the central treasury granting only sums in aid.

Every child, on attaining the age of six, must attend a common elementary school, where, during five years of course, all education is given in morals, reading, arithmetic, the rudiments of technical work, gymnastics and poetry. Year by year the attendance at these schools has increased. Thus, whereas in the year 1900, only 81-67% of the children of school age went to school, by the year 1913, the figure of elementary instruction, the figure of 1905 was 94-93%. The desire for instruction used to be keener among boys than among girls, as was natural in view of the difference of inducement; but ultimately this discrepancy has disappeared and possibly even reversed. Whereas the percentage of girls attending school was 75-90 in 1905, it rose to 91-46 in 1905, and the corresponding figures for boys were 90-35 and 97-10 respectively. The tuition fee paid at a common elementary school is generally 50._yen_. The local authorities pay the salaries of the teachers. In the larger urban districts, 10s.; but in practice it is much smaller, for these elementary schools form part of the communal system, and such portion of their expenses as is not covered by tuition fees, income from endowments and miscellaneous sources comes out of the proceeds of local taxation. In 1909 there were 18,160 common elementary schools, and also 9105 schools classed as elementary but having sections where, subsequently to the completion of the regular curriculum, a special supplementary course of study might be pursued in agriculture, commerce or industry (needle-work in the case of girls). The time devoted to these special courses is two, three or four years, according to the degree of proficiency contemplated, and the maximum fees are 150._yen._ per month in urban districts and one-half of that amount in rural districts.

There are also 204 kindergartens, with an attendance of 26,000 infants, whose parents pay 3._yen._ per month on the average for each child. In general the kindergartens are connected with elementary schools or with normal schools.

If a child, after graduation at a common elementary school, does not meet with any school—such as a common middle school, where training is given for practical pursuits or for admission to higher educational institutions. The ordinary curriculum at a common middle school includes moral philosophy, English language, French language, algebra, geometry, arithmetic, physiology, chemistry, drawing and the Japanese language. Five years are required to graduate, and from the fourth year the student may take up a special technical course as well as the main course; or, in accordance with local custom, he may be exempted from examination, to a high school, where he spends three years preparing to pass to a university, or four years studying a special subject, as law, engineering or medicine. By following the course for three years of a normal school, a youth may be graduated at the age of 28, when one year as a volunteer will free him from all service with the colours. A high-school certificate of graduation entitles its holder to enter a university without examination, and guarantees him for all time a rank above the ordinary.

For girls also high schools are provided, the object being to give a general education of higher standard. Candidates for admission must be over 12 years of age, and must have completed the second year of a common middle school. The minor course of study requires 4 years, and supplementary courses as well as special art courses may be taken.

In addition to the schools already enumerated, which may be said to correspond to the English system of secondary education there are special schools, generally private, and technical schools (including a few private), where instruction is given in medicine and surgery, agriculture, commerce, mechanics, applied chemistry, navigation, electrical engineering, art (pictorial and applied), veterinary science, sericulture and various other branches of industry. There are also apprentices' schools, classed under the heading of elementary, where a course of not less than six months, and not more than four years, may be taken in dyeing and weaving, embroidery, the making of artificial flowers, tobacco manufactures, silk dyeing, pottery, lacquer, woodwork, metal-work or brewing. There are also schools—nearly all supported by private enterprise—for the blind and the deaf.

Normal schools are maintained for the purpose of training teachers, a class of persons not plentiful in Japan, doubtless because of an exceptionally low scale of emoluments, the yearly pay not exceeding 500 and often falling as low as 45._yen_.

There are two Imperial universities, one in Kioto and one in Tōkyō. In 1909 the former had about 220 professors and instructors and 2880 students. Its colleges number six: law, medicine, engineering, literature, science and agriculture. It has a university hall in which graduations and conventions are held. The degree courses consist of a four-year course, which is graduated when all parts of the curriculum are completed. There are no examinations for admission to the university or for graduation, but examination for admission to the various faculties is required. The examinations are held when the students are in their fourth or fifth year, and, in the case of students who have not passed the entrance examination, when they have completed three years of study. The fees payable at the university consist of an annual fee of 50._yen_. in every year while in attendance, and a one-time fee of 30._yen_. in the first year of life admission. In addition, students are required to pay private fees, a total of 200._yen_. in the first year of study, and 100._yen_. in the second and following years. The fees thus charged in the University of Kioto amount to 80._yen_. per year, or 800._yen_. for four years. The fees are nothing in comparison with those of the universities in Europe, but the instruction is free, except for the fees charged for books and libraries.

Public education in Japan is strictly secular: no religious teaching of any kind is permitted in the schools. There are about 100 libraries. Apart from the shelves there are at the branch, the rate of growth being from 45 to 100 in the intervening period ended 1909. The largest library is the Imperial, in Tōkyō. It had about half a million volumes in 1909, and the daily average of visitors was about 450.
JAPAN

RELIGION

Shintō is thus a mixture of ancestor-worship and of nature-worship without any explicit code of morals. It regards human beings as virtuous by nature; assumes that each man’s conscience is his best guide; and while believing in a continued existence beyond the grave, entertains no theory as to its pleasures or pains. Those that pass away become disembodied spirits, inhabiting the world of darkness (yomi-no-yo) and possessing power to bring sorrow or joy into the lives of their survivors, on which account they are worshipped and propitiated. Purity and simplicity being essential characteristics of the cult, its shrines are built of white wood, absolutely without decorative features of any kind, and fashioned as were the original huts of the first Japanese settlers. There are no graven images—a fact attributed by some critics to ignorance of the plastic arts. The principal shrine of Japan had no name, and that it did not begin to be called Shintō until Buddhism had entered the field.

The two creeds remained distinct, though not implacably antagonistic, until the beginning of the 9th century, when they were welded together into a system of doctrine to which the name Kyōdo-Shintō (dual Shintō) was given. In this new creed the Shintō deities were regarded as avatars of Buddhist divinities, and thus it may be said that Shintō was absorbed into Buddhism. Probably that would have been the fate of the indigenous creed in any circumstances, for a religion without a theory as to a future state and without any code of moral duties could scarcely hope to survive contact with a faith so well equipped as Buddhism in these respects. But Shintō, though absorbed, was not obliterated. Its beliefs survived; its shrines survived; its festivals survived, and something of its rites survived also.

Shintō, indeed, may be said to be entwined about the roots of Japan’s national existence. Its scripture—as the Kojiki must be considered—resembles the Bible in that both begin with the cosmogony. But it represents the gods as peopling the newly created earth with their own offspring instead of with human beings expressly made for the purpose. The actual work of creation was done by a male deity, Izanagi, and a female deity, Izanami. From the right eye of the former was born Amaterasu, who became goddess of the sun; from his left eye, the god of the moon; and from his nose, a species of Lucifer. The grandson of the sun goddess was the first sovereign of Japan, and his descendants have ruled the land in unbroken succession ever since, the 121st being on the throne in 1900. Thus it is to Amaterasu (the heaven-dwelling goddess) that the Japanese pay reverence above all other deities, and it is to her shrine at Ise that pilgrims chiefly flock.

The story of creation, as related in the Kojiki, is obviously based on a belief that force is indescribable, and that every exercise of it is productive of some permanent result. Thus by the motions of the creative spirit there spring into existence all the elements that go to make up the universe, and these, being of divine origin, are worshipped and propitiated. Their number becomes immense when we add the defiled ghosts of ancestors who were descended from the gods and whose names are associated with great deeds. These ancestors are often regarded as the tutelary deities of districts, where they receive special homage and where shrines are erected to them. The method of worship consists in making offerings and in the recital of rituals (narito).

Twenty-seven of these rituals were reduced to writing and embodied in a work called Engishiki (927). Couched in antique language, these liturgies are designed for the dedication of shrines, for propitiating evil, for entreating blessings on the harvest, for purification, for obtaining household security, for bespeaking protection during a journey, and so forth. Nowhere is any reference found to a future state of reward or punishment, to deliverance from evil, to assistance in the path of virtue. One ceremonial only is designed to avert the consequences of sin or crime; namely, the rite of purification, which, by washing with water and by the sacrifice of valuables, removes the pollution resulting from all wrong-doing. Originally performed on behalf of individuals, this 8-bara ultimately came to be a semi-annual ceremony for sweeping away the sins of all the people.

Shintō

The primitive religion of Japan is known by the name of Shintō, which signifies “the divine way,” but the Japanese maintain that this term is of comparatively modern application. The term Shintō being obviously of Chinese origin, cannot have been used in Japan before she became acquainted with the Chinese language. Now Buddhism did not reach Japan until the 6th century, and a knowledge of the Chinese language had preceded it by only a hundred years. It is therefore reasonable to conclude that the primitive religion of Japan had no name, and that it did not begin to be called Shintō until Buddhism had entered the field.
of such magnitude as the Chinese scriptures of the Mahayana. “The canon is seven hundred times the amount of the New Testament. Hsüan Tsang’s translation of the Prajña paramita is twenty-five times as large as the whole Christian Bible.”

It is natural that out of such a mass of doctrine different systems should be elaborated. The Buddhism that came to Japan prior to the days of Dengyō daishi was that of the Vaiśāky school, which seems to have been accepted in its entirety. But the Tendai doctrines, introduced by Dengyō, Tikkaku and other fellow-thinkers, though founded mainly on the Saddharma-pundarika, were subjected to the process of eclecticism which all foreign institutions undergo at Japanese hands. Dengyō studied it in the monastery of Tientai which “had been founded towards the close of the 6th century of our era on a lofty range of mountains in the province of Chekiang by the celebrated preacher Chikai” (Lloyd, “Developments of Japanese Buddhism,” Transactions of the Asiatic Society of Japan, vol. xxl.), and carrying it to Japan he fitted its disciplinary and meditative methods to the foundations of the sects already existing there.

This eclecticism was even more marked in the case of the Shingon (true word) doctrines, taught by Dengyō’s illustrious contemporary, Kōbō daishi, who was regarded as the incarnation of Vairocana. He led his countrymen, by a path almost wholly his own, from the comparatively low platform of Hinayana Buddhism, whose sole aim is individual salvation, to the Mahāyana doctrine, which teaches its devotee to strive after perfect enlightenment, not for his own sake alone, but also that he may help his fellows and intercede for them. Then followed the Jōdo (Pure Land) sect, introduced in 1153 by a priest, Senku, who is remembered by later generations as Hōnen shōnin. He taught salvation by faith ritualistically expressed. “The virtue that saves comes, not from imitation of and conformity to the person and character of the saviour Amida, but from blind trust in his efforts and ceaseless repetition of pious formulae. It is really a religion of despair rather than of hope, and in that respect it reflects the profound sympathy awakened in the bosom of its teacher by the sorrows and sufferings of the troubled times in which he lived. A favourite pupil of Hōnen shōnin was Shinran (1173–1262). He founded the Jōdo Shinshū (true sect of jōdo), commonly called simply Shinshū and sometimes Monto, which subsequently became the most influential of Japanese sects, with its splendid monasteries, the two Hōnmon-ji in Kiōto. The differences between the doctrines of this sect and those of its predecessors were that the former “divested itself of all metaphysics”; knew nothing of a philosophy of religion, dispensed with a multiplicity of acts of devotion and the keeping of many commandments; did not impose any vows of celibacy or any renunciation of the world, and simply made faith in Amida the all in all. In modern days the Shinshū sect has been the most progressive of all Buddhist sects and has freely sent forth its promising priests to study in Europe and America. Its devotees make no use of charms or spells, which are common among the followers of other sects.

Anteriorly by a few years to that introduction of the Shinshū was the Zen sect, which has three main divisions, the Rinzai (1168), the Sōtō (1223) and the Obaku (1650). This is essentially a contemplative sect. Truth is reached by pure contemplation, and knowledge can be transmitted from heart to heart without the use of words. In that simple form the doctrine was accepted by the Rinzai believers. But the founders of the Sōtō branch—Shōyō taishō and Butsui Zenji—added scholarship and research to contemplation, and taught that the “highest wisdom and the most perfect enlightenment are attained when all the elements of phenomenal existence are recognized as empty, vain and unreal.” This creed played an important part in the development of Bushidō, and its priests have always been distinguished for erudition and indifference to worldly possessions.

Last but not least important among Japanese sects of Buddhism is the Nichiren or Hokke, called after its founder, Nichiren (1222–1282). It was based on the Saddharma-pundarika, and it taught that there was only one true Buddha—the moon in the heavens—the other Buddhas being like the moon reflected in the waters, transient, shadowy reflections of the Buddha of truth. It is this being who is the source of all phenomenal existence, and in whom all phenomenal existence has its being. The imperfect Buddhism teaches a chain of cause and effect; true Buddhism teaches that the first link in this chain of cause and effect is the Buddha of original enlightenment. When this point has been reached true wisdom has at length been attained. Thus the monotheistic faith of Christianity was virtually reached in one God in whom all creatures “live, move and have their being.” It will readily be conceived that these varied doctrines caused dissension and strife among the sects professing them. Sectarian controversies and squabbles were nearly as prominent among Japanese Buddhists as they were among European Christians, but to the credit of Buddhism it has to be recorded that the stake and the rack never found a place among its instruments of self-assertion. On the other hand, during the wars that devastated Japan from the 12th to the end of the 16th century, many of the monasteries became military camps, and the monks, wearing armor and wielding glaives, fought in battle as well as religious causes.

The story of the first Christian missionaries to Japan is told elsewhere (pp. 187–189). In 1858, almost simultaneously with the conclusion of the American treaties, a small band of Catholic fathers entered Japan from the Ryūkyū islands, and led the first missionaries there in 1866. They found that, in the neighbourhood of Nagasaki, there were some small communities where Christian worship was still carried on. It would seem that these communities had not been subjected to any severe official scrutiny. As the arrival of the fathers revived the old question, and the native Christians, or such of them as refused to apostatize, were removed from their homes and sent into banishment. This was the last example of religious intolerance in Japan. At the instance of the foreign church the government in 1868 restored the confiscated properties, most of which had been retaken by the imperial house in 1873, and from that time complete freedom of conscience existed in fact, though it was not declared by law until the promulgation of the constitution in 1889. In 1905 there were 60,000 Roman Catholic converts in Japan. Among the Japanese churches, the sects include the Christian Reformed, the American Mission, and the United Brethren. The converts number 11,000. The Protestant missions include Presbyterian (Nihon Kirisuto Kyokai), Congregational (Kumi-ai), Methodist, and the Russian (Kyusei-gun). The converts include both native Japanese and Japanese and American missionaries. The converts number 11,000. The Protestant churches have about 1,000 missionaries; 12,000 converts; a number of boarding schools for boys and girls and day schools. The Congregational and Presbyterian have about 1,000 missionaries and 10,000 converts; boarding schools, day schools, and the most important Christian college in Tôkyô, the Awoyama Gaku-in. The Baptistals represent 4 American missions, with about 8,000 converts; they have 300 missionaries and 6,000 catechists, and their works include an academy for boys, boarding schools for girls, day schools and 3,000 converts. The Salvation Army, which did not enter Japan until 1895, has organized 15 corps, and publishes ten thousand copies of a fortnightly magazine, the War Cry (Toki no kosai). Finally, the Society of Friends, the Women’s Foreign Missionary Society, and the Young Men’s Christian Association have a number of missions. It will be seen from the above that the missionaries in Japan, in the space of half a century (1858 to 1908), had won 110,000 converts, and the United Brethren, the American Church, which has a fine cathedral in Tôkyô, a staff of about 40 Japanese priests and deacons and 27,000 converts, the whole presided over by a bishop. Thus the total number of converts...
becomes 137,000. In spite of the numerous sects represented in Japan there has been virtually no sectarian strife, and it may be said of the Japanese converts that they concern themselves scarcely at all about the subtleties of dogma which divide European Christian-ity. Their tendency is to consider it one of the practical aspects of the faith as a moral and ethical guide. They are disposed, also, to adapt the creed to their own requirements just as they adapted Buddhism, and this is a disposition which promises to grow.

VIII.—Foreign Intercourse

Foreign Intercourse in Early and Medieval Times.—There can be no doubt that commerce was carried on by Japan with China and Korea earlier than the 8th century of the Christian era. It would appear that from the very outset over-sea trade was regarded as a government monopoly. Foreigners were allowed to travel freely in the interior of the country provided that they submitted their baggage for official inspection and made no purchases of weapons of war, but all imported goods were bought in the first place by official appraisers who subsequently sold them to the people at arbitrarily fixed prices. Greater importance attached to the trade with Japan than with the Ashikaga shōguns (14th, 15th and 16th centuries), who were in constant need of funds to defray the cost of innumerable military operations caused by civil disturbances. In this distress they turned to the neighbouring empire as a source from which money might be obtained. This idea seems to have suggested to the ōshō Takaui by a Buddhist priest, when he undertook the construction of the temple Tenryū-ji. Two ships laden with goods were fitted out, and it was decided that the enterprise should be repeated annually. Within a few years after this development of commercial relations between the two empires, an interruption occurred owing partly to the overthrow of the Yuen Mongols by the Chinese Ming, and partly to the activity of Japanese pirates and adventurers who raided the coasts of China. The ōshō Yoshimizu (1368–1394), however, succeeded in restoring commercial intercourse, though in order to effect his object he consented that goods sent from Japan should bear the character of tribute and that he himself should receive investiture at the hands of the Chinese emperor's ambassador. The Nanking government granted a certain number of commercial passports, and these were given by the ōshō to Ouchi, feudal chief of Cho-shū, which had long been the principal port for trade with the neighbouring empire. Tribute goods formed only a small fraction of a vessel's cargo: the bulk consisted of articles which were delivered into the government's stores in China, payment being received in copper cash. It was from this transaction that the ōshō derived a considerable part of his profits, for the articles did not cost him anything originally, being either presents from the great temples and provincial governors or compulsory contributions from the house of Ouchi. As for the gifts by the Chinese government and the goods shipped in China, they were arbitrarily distributed among the noble families in Japan at prices fixed by the ōshō's assessor. Thus, so far as the ōshō was concerned, these enterprises could not fail to be lucrative. They also brought large profits to the Ouchi family, for, in the absence of competition, the products and manufactures of each country found ready sale in the markets of the other. The articles found most suitable in China were swords, fans, screens, lacquer wares, copper and agate, and the goods brought back to Japan were brocade and other silk fabrics, ceramic productions, jade and fragrant woods. The Chinese seem to have had a just appreciation of the wonderful swords of Japan. At first they were willing to pay the equivalent of 12 guineas for a pair of blades, but by degrees, as the Japanese began to increase the supply, the price fell, and at the beginning of the 16th century all the diplomacy of the Japanese envoys was needed to obtain good figures for the large and constantly growing quantity of goods that they took over by way of supplement to the tribute. Buddhist priests generally enjoyed the distinction of being selected as envoys, for experience showed that their subtle reasoning invariably overcame the economical scruples of the Chinese authorities and secured a fine profit for their master, the ōshō. In the middle of the 16th century these tribute-bearing missions came to an end with the ruin of the Ouchi family and the overthrow of the Ashikaga ōshō, and they were never renewed.

Japan's medieval commerce with Korea was less ceremonious than that with China. No passports had to be obtained from the Korean government. A trader was sufficiently equipped when he carried a permit from the So family, which held the island of Tsushima in fief. Fifty vessels were allowed to pass yearly from ports in Japan to the three Japanese settlements in Korea. Little is recorded about the nature of this trade, but it was rudely interrupted by the Japanese settlers, who, offended at some arbitrary procedure on the part of the local Korean authorities, took up arms (A.D. 1510) and at first signally routed the Koreans. An army from Seoul turned the tables, and the Japanese were compelled to abandon the three settlements. Subsequently the ōshō's government—which had not been concerned in the struggle—approached Korea with amicable proposals, and it was agreed that the ring leaders of the raiders should be decapitated and their heads sent to Seoul. Japan's compliance with this condition affording, perhaps, a measure of the value she attached to neighbourly bæhip. Thenceforth the number of vessels was limited to 25 annually and the settlements were abolished. Some years later, the Japanese again resorted to violent acts of self-assertion, and on this occasion, although the offenders were arrested by order of the ōshō Yoshiharu, and handed over to Korea for punishment, the Seoul court persisted in declining to restore the system of settlements or to allow the trade to be resumed on its former basis. Fifty years afterwards the taiko's armies invaded Korea, overrunning it for seven years, and leaving, when they retired in 1598, a country so impoverished that it no longer offered any attraction to commercial enterprise from beyond the sea.

The Portuguese discovered Japan by accident in 1542 or 1543—the exact date is uncertain. On a voyage to Macao from Siam, a junk carrying three Portuguese was blown from her course and fetched Tanegashima, a small island lying south of the province of Satsuma. The Japanese, always hospitable and inquisitive, welcomed the newcomers and showed special curiosity about the arquebuses carried by the Portuguese, fire-arms being then a novelty in Japan and all weapons of war being in great request. Conversation was impossible, of course, but, by tracing ideographs upon the sand, a Chinese member of the crew succeeded in explaining the cause of the junk's arrival. She was then piloted to a more commodious harbour, and the Portuguese sold two arquebuses to the local feudalist, who immediately ordered his armourer to manufacture similar weapons. Very soon the news of the discovery reached all the Portuguese settlements in the East, and at least seven expeditions were fitted out during the next few years to exploit this new market. Their objective points were all in the island of Kiūshū—the principal stage where the drama—ultimately converted into a tragedy—of Christian propagation and European commercial intercourse was acted in the interval between 1542 and 1637.

With Occidental Nations.

The Jesuits at Macao, Goa or other centres of Portuguese influence in the East took immediate advantage of the discovery of Japan. The pioneer Arrival of the Jesuits. was Francis Xavier, who landed at Kagoshima on the 15th of August 1549. During the interval of six (or seven) years that separated this event from the drifting of the junk to Tanegashima, the Portuguese had traded freely in the ports of Kiūshū, had visited Kioto, and had reported the Japanese capital to be a city of 96,000 houses, therefore larger than Lisbon. Xavier would certainly have gone to Japan even though he had not been specially encouraged, for the reports of his countrymen depicted the Japanese as "very desirous of being instructed," and he longed to find a field more promising than that inhabited by "all these Indian nations, barbarous, vicious and without inclination to virtue." There were, however, two special determinants. One was a request addressed by a feu’datory, supposed to have been the chief of the
Bungo fief, to the viceroy of the Indies at Goa; the other, an appeal made in person by a Japanese named Yajiro, whom the fathers spoke of as Anjiro, and who subsequently attained celebrity under his baptismal name, Paul of the holy faith. No credible reason is historically assigned for the action of the Japanese feudatory. Probably his curiosity had been excited by accounts which the Portuguese traders gave of the noble devotion of their country’s missionaries, and being entirely without bigotry, as nearly all Japanese were at that epoch, he issued the invitation partly out of curiosity and partly from a sincere desire for progress. Anjiro’s case was very different. Labouring under stress of repentant zeal, and fearful that his evil acts might entail murderous consequences, he sought an asylum abroad, and was taken away in 1548 by a Portuguese vessel whose master advised him to repair to Malacca for the purpose of conferring to Xavier. This might well have seemed to the Jesuits a providential dispensation, for Anjiro, already able to speak Portuguese, soon mastered it sufficiently to interpret for Xavier and his fellow-missionaries (without which aid they must have remained long helpless in the face of the immense difficulties of the Japanese language), and the linguistic skill he added extraordinary gifts of intelligence and memory. Xavier, with two Portuguese companions and Anjiro, were excellently received by the feudal chiefs of Satsuma and obtained permission to preach their doctrine in any part of the fief. This permit is not to be construed as an evidence of official sympathy with the foreign creed. Commercial considerations alone were in question. A Japanese feudal chief in that era had sedulously to foster every source of wealth or strength, and as the newly opened trade with the outer world seemed full of golden promise, each feudo-vasser was less anxious to secure a monopoly of it in the 16th century than the Ashikaga shōguns had been in the 15th. The Satsuma daimyō was led to believe that the presence of the Jesuits in Kagoshima would certainly prelude the advent of trading vessels. But within a few months one of the expected merchantmen sailed to Hirado without touching at Kagoshima, and her example was followed by two others in the following year; so that the Satsuma chief saw himself flouted for the sake of a petty rival, Matsusada of Hirado. This fact could not fail to provoke his resentment. But there was another influence at work. Buddhism has always been a tolerant religion, eclectic rather than exclusive. Xavier, however, had all the bigoted intolerance of his time. The Buddhist priests in Kagoshima received him with courtesy and listened respectfully to the doctrines he expounded through the mouth of Anjiro. Xavier rejoined with a display of aggressive intolerance which shocked and alienated the Buddhists. They represented to the Satsuma chief that peace and good order were inconsistent with such a display of militant propagandism, and he, already profoundly chagrined by his commercial disappointment, issued in 1550 an edict making it a capital offence for any of his vassals to embrace Christianity. Xavier, or, more correctly speaking, Anjiro, had won 130 converts, who remained without molestation, but Xavier himself took ship for Hirado. There he was received with a salvo of artillery by the Portuguese merchantmen lying in that harbour, and with marks of profound respect by the Portuguese traders, a display which induced the local chief to issue orders that courteous attention should be paid to the teaching of the foreign missionaries. In ten days a hundred baptisms took place; another significant index of the mood of the Japanese in the early era of Occidental intercourse: the men in authority always showed a complaisant attitude towards Christianity where trade could be fostered by so doing, and wherever the men in authority showed such an attitude, considerable numbers of the lower orders embraced the foreign faith. Thus, in considering the commercial history of the era, the element of religion constantly thrusts itself into the foreground. Xavier next resolved to visit Kioto. The first town of importance he reached on the way was Yamaguchi, capital of the Chōshū fief, situated on the northern shore of the Shimonoseki Strait. There the feudal chief, Ouchi, though sufficiently courteous and inquisitive, showed no special cordiality towards humble missionaries unconnected with commerce, and the work of proselytizing made no progress, so that Xavier and his companion, Fernandez, pushed on to Kioto. The time was mid-winter; the two fathers suffered terrible privations during their journey of two months on foot, and on reaching Kioto they found a city which had been almost wholly reduced to ruins by intermittent war. Necessarily they failed to obtain audience of either emperor or shōgun, at that time the most inaccessible potentates in the world, the Chinese “son of heaven” excepted, and nothing remained but street preaching, a strange resource, seeing that Xavier, constitutionally a bad linguist, had only a most rudimentary acquaintance with the profoundly difficult tongue in which he attempted to expound the mysteries of a novel creed. A fortnight sufficed to convince him that Kioto was unfruitful soil. He therefore returned to Yamaguchi. But he had now learned a lesson. He saw that propagandism without scrip or staff and without the countenance of those sitting in the seats of power would be futile in Japan. So he obtained from Hirado his canonicals, together with a clock and other novel products of European skill, which, as well as credentials from the viceroy of India, the governor of Malacca and the bishop of Goa, he presented to the Chōshū chief. His prayer for permission to preach Christianity was now readily granted, and Ouchi issued a proclamation announcing his approval of the introduction of the new religion and according perfect liberty to embrace it. Xavier and Fernandez now made many converts. They also gained the valuable knowledge that the road to success in Japan lay in associating themselves with over-sea commerce and its directors, and in thus winning the co-operation of the feudal chiefs.

Nearly ten years had now elapsed since the first Portuguese landed in Kagoshima, and during that time trade had gone on steadily and prosperously. No attempt was made to find markets in the main island: the Portuguese confined themselves to Kiūshū for two reasons: one, that having no knowledge of the coasts, they hesitated to risk their ships and their lives in unsurveyed waters; the other, that whereas the main island, almost from end to end, was seething with inter-necie war, Kiūshū remained beyond the pale of disturbance and enjoyed comparative tranquillity. At the time of Xavier’s second sojourn in Yamaguchi, a Portuguese ship happened to be visiting Bungo, and at its master’s suggestion the great missionary proceeded thither, with the intention of returning temporarily to the Indies. At Bungo there was then ruling Otomo, second in power to only the Satsuma chief among the feudatories of Kiūshū. By him the Jesuit father was received with all honour. Xavier did not now neglect the lesson he had learned in Yamaguchi. He repaired to the Bungo chieftain’s court, escorted by nearly the whole of the Portuguese crew, gregariously bedizened, carrying their arms and with banners flying. Otomo, a young and ambitious ruler, was keenly anxious to attract foreign traders with their rich cargoes and puissant weapons of war. Witnessing the reverence paid to Xavier by the Portuguese traders, he appreciated the importance of gaining the goodwill of the Jesuits, and accordingly not only granted them full freedom to teach and preach, but also enjoined upon his younger brother, who, in the sequel of a sudden rebellion, had succeeded to the lordship of Yamaguchi, the advisability of extending protection to Torres and Fernandez, then sojourning there. After some four months’ stay in Bungo, Xavier set sail for Goa in February 1552. Death overtook him in the last month of the same year.

Xavier’s departure from Japan marked the conclusion of the first epoch of Christian propagandism. His sojourn in Japan extended to 27 months. In that time he and his coadjutors won about 700 converts. In Satsuma more than a year’s labour produced 150 believers. There Xavier had the assistance of Anjiro to expound his doctrines. No language lends itself with greater difficulty than Japanese to the discussion of theological questions. The terms necessary for such a purpose are not current among laymen, and only by special
study, which, it need scarcely be said, must be precluded by an accurate acquaintance with the tongue itself, can a man hope to become duly equipped for the task of exposition and dissertation. It is open to grave doubt whether any foreigner has ever attained the requisite proficiency. Leaving Anjirō in Kagoshima to care for the converts made there, Xavier pushed on to Hirado, where he baptized a hundred Japanese in a few days. Now we have it on the authority of Xavier himself that in this Hirado campaign "none of us knew Japanese." How then did they proceed? "By reciting a semi-Japanese volume" (a translation made by Anjirō of a treatise from Xavier’s pen) "and by delivering sermons, we brought several over to the Christian cult." Sermons preached in Portuguese or Latin to a Japanese audience on the island of Hirado in the year 1550 can scarcely have attracted intelligent interest. On his first visit to Yamaguchi, Xavier’s means of access to the understanding of his hearers was confined to the rudimentary knowledge of Japanese which Fernandez had been able to acquire in 14 months, a period of study which, in modern times, with all the aids now procurable, would not suffice to carry a student beyond the margin of the colloquial. No converts were won.

The people of Yamaguchi probably admired the splendid faith and devotion of these over-sea philosophers, but as for their doctrine, it was unintelligible. In Kioto the same experience was repeated, with an addition of much physical hardship. But when the Jesuits returned to Yamaguchi in the early autumn of 1551, they baptized 500 persons, including several members of the military class. Still Fernandez with his broken Japanese was the only medium for communicating the profound doctrines of Christianity. It must be concluded that the teachings of the missionaries produced much less effect in the attitude of the local chieftain.

Only two missionaries, Torres and Fernandez, remained in Japan after the departure of Xavier, but they were soon joined by three others. These newcomers landed at Kagoshima and found that, in spite of the official veto against the adoption of Christianity, the feudal chief had lost nothing of his desire to foster foreign trade.

Two years later, all the Jesuits in Japan were assembled in Bungo. Their only church stood there; and they had also built two hospitals. Local disturbances had compelled them to withdraw from Yamaguchi, not, however, before their violent disputes with the Buddhist priests in that town had induced the feudal lord to proscribe the foreign religion, as had previously been done in Kagoshima. From Funai, the chief town of Bungo, the Jesuits began in 1579 to send yearly reports to their Generals in Rome. These reports, known as the Annual Letters, comprise some of the most valuable information available about the conditions then existing in Japan. They describe a state of abject poverty among the lower orders; poverty so cruel that the destruction of children by their famishing parents was an everyday occurrence, and in some instances choice had to be made between cannibalism and starvation. Such suffering becomes easily intelligible when the fact is recalled that Japan had been ravaged by civil wars for many years, and the feudal chief fighting for his own hand, to save or to extend his territorial possessions. From these Annual Letters it is possible also to gather a tolerably clear idea of the course of events during the years immediately subsequent to Xavier’s departure. There was no break in the continuity of the newly inaugurated foreign trade. Portuguese ships visited Hirado as well as Bungo, and in those days their masters and crews not only attended scrupulously to their religious duties, but also showed such profound respect for the missionaries that the Japanese received constant object lessons in the influence wielded over the traders by the Jesuits. Thirty years later, this orderly and reverential demeanour was exchanged for riotous excesses such as had already made the Portuguese sailor a byword in China. But in the early days of intercourse with Japan the crews of the merchant vessels seem to have preached Christianity by exemplary conduct. Just as Xavier had been induced to visit Bungo by the anxiety of a ship-captain for Christian ministrations, so in 1557 two of the fathers repaired to Hirado in obedience to the solicitations of Portuguese sailors. There the fathers, under the guidance of Vilela, sent brothers to parade the streets ringing bells and chanting litanies; they organized bands of boys for the same purpose; they caused the converts, and even children, to flagellate themselves at a model of Mount Calvary, and they worked miracles, healing the sick by contact with scourges or with a booklet in which Xavier had written litanies and prayers. It may well be imagined that such doings attracted surprised attention in Japan. They were supplemented by even more striking practices. For a sub-feudatory of the Hirado chief, having been converted, showed his zeal by destroying Buddhist temples and throwing down the idols, thus inaugurating a campaign of violence destined to mark the progress of Christianity throughout the greater part of its history in Japan. There followed the overthrowing of a cross in the Christian cemetery, the burning of a temple in the town of Hirado, and a street riot, the sequel being that the Jesuit fathers were compelled to return once more to Bungo.

It is essential to follow all these events, for not otherwise can a clear understanding be reached as to the aspects under which Christianity presented itself originally to the Japanese. The Portuguese traders, reverent as was their demeanour towards Christianity, did not allow their commerce to be interrupted by vicissitudes of propaganda. They still repaired to Hirado, and rumours of the wealth-begetting effects of their presence had spread beyond the borders of Omura, his chief, Sumitada, made overtures to the Jesuits in Bungo, offering a port free from all dues for ten years, a large tract of land, a residence for the missionaries and other privileges. The Jesuits hastened to take advantage of this proposal, and no sooner did the news reach Hirado than the feodatory of that island repented of having expelled the fathers and invited them to return. But while they hesitated, a Portuguese vessel arrived at Hirado, and the feudal chief declared publicly that no need existed to conciliate the missionaries, since trade went on without them. When this became known in Bungo, Torres hastened to Hirado, was received with extraordinary honours by the crew of the vessel, and at his instance she left the port, her master declaring that he would not remain in a country where they maltreated those who professed the same religion as himself. Hirado remained a closed port for some years, but ultimately the advent of three merchantmen, which intimated their determination not to put in unless the anti-Christian ban was removed, induced the feudal chief to receive the Jesuits once more. This incident was paralleled a few years later in the island of Amakusa, where a petty feudatory, in order to attract foreign trade, as the missionaries themselves frankly explain, embraced Christianity and ordered all his vassals to follow his example; but when no Portuguese ship appeared, he apostatized, required his subjects to revert to Buddhism and made the missionaries withdraw. In fact, the competition for the patronage of Portuguese traders was so keen that the Hirado feudatory attempted to burn several of their vessels because they frequented the territorial waters of Amakusa. The latter became a most stalwart Christian when his wish was fulfilled. He set himself to eradicate idolatry throughout his fief with the strong arm, and his fierce intolerance provoked results which ended in the destruction of the Christian town at the newly opened free port. Sumitada, however, quickly reasserted his authority, and five years later (1567), he took a step which had far-reaching consequences, namely, the building of a church at Nagasaki, in order that Portuguese commerce might have a centre and the Christians an assured asylum. Nagasaki was then a little fishing village. In five years it grew to be a town of thirty thousand inhabitants, and Sumitada became one of the richest of the Kōshū feudatories. When in 1573 successful conflicts with the neighbouring fiefs brought him an access of territory, he declared that he owed these victories to the influence of the Christian God, and shortly afterwards he publicly proclaimed banishment for all who would not accept the foreign faith. There were then no Jesuits by his side, but immediately two
Christian propaganda had now made substantial progress. The Annual Letter of 1582 recorded that at the close of 1581, thirty-two years after the landing of Xavier in Japan, there were about 150,000 converts, of whom some 125,000 were in Kishū and the remainder in Yamaguchi, Kioto and the neighbourhood of the latter city. The Jesuits in the empire then numbered 75, but down to the year 1563 there had never been more than 9, and down to 1577, not more than 18. The harvest was certainly great in proportion to the number of sowers. But it was a harvest mainly of artificial growth; forced by the despotic insistence of feudal chiefs who possessed the power of life and death over their vassals, and were influenced by a desire to attract foreign trade. To the Buddhist priests this movement of Christian propaganda had brought an experience hitherto unknown to them, persecution on account of creed. They had suffered for interfering in politics, but the fierce cruelty of the Christian fanatic now became known for the first time to men themselves conspicuous for tolerance of heresy and receptivity of instruction. They had had no previous experience of humanity in the garb of an Otomo of Bungo, who, in the words of Crasset, went to the chase of the bonzes as to that of wild beasts, and made it his singular pleasure to exterminate them from his seashores.

In 1582 the first Japanese envoys sailed from Nagasaki for Europe. The embassy consisted of four youths, the oldest not more than 16, representing the fief of Amura, Omura and Bungo. They visited Lisbon, Madrid and Rome, and in all these cities they were received with displays of magnificence such as 16th-century Europe delighted to make. That, indeed, had been the motive of Velegnani in organizing the mission; he desired to let the Japanese see with their own eyes how great were the riches and might of Western states.

In the above statistics of converts at the close of 1581 mention is made of Christians in Kioto, though we have already seen that the visit by Xavier and Fernandez to that city was wholly barren of results. A second visit, however, made by Vilela in 1559, proved more successful. He carried letters of recommendation from the Bungo chieftain, and the proximate cause of his journey was an invitation from a Buddhist priest in the celebrated monastery of Hiei-zan, who sought information about Christianity. This was before the razing of temples and destruction of books that had been done in the other towns of his fief, and he seconded the preachers of the gospel so well in everything else that he could flatter himself that he soon would not have one single idolater in his states. Thus in the two years that separated his baptism from his death, twenty thousand converts were won in Arima. But his successor was an enemy of the alien creed. He ordered the Jesuits to quit his dominions, required the converts to return to their ancestral faith, and caused "the holy places to be destroyed and the crosses to be thrown down." Nearly one-half of the converts apostatized under this pressure, but others had recourse to a device of proved potency. They threatened to leave Kuchinotsu en masse, and as that would have involved the loss of foreign trade, the hostile edict was materially modified. To this same weapon the Christians owed a still more signal victory. For just at that time the great ship from Macao, now an annual visitor, arrived in Japanese waters carrying the visitor-general, Velegnani. She put into Kuchinotsu, and her presence, with its suggested eventualities, gave such satisfaction that the edictory offered to accept baptism and to sanction its acceptance by his vassals. This did not satisfy Velegnani, a man of profound political sagacity. He saw that the fief was menaced by serious dangers at the hands of its neighbours, and seizing the psychological moment of its extreme peril, he used the secular arm so adroitly that the fief's chance of survival seemed to be limited to the unreserved adoption of Christianity. Thus, in 1580, the chieftain and his wife were baptized; "all the city was made Christian; they burned their idols and destroyed 40 temples, reserving some materials to build churches."
hostile at the outset, who had been nominated as official commissioners to investigate and report upon the doctrine of Christianity. The first conversion en masse was due to pressure from above. A petty feudatory, Takayama, whose chief lay at Takatsuki in the neighbourhood of the capital, challenged Vilela to a public controversy, the result of which was that the Japanese acknowledged himself vanquished, embraced Christianity and invited his vassals as well as his family to follow his example. This man's son—Takayama Yūshō—proved one of the worst supporters of Christianity in all Japan, and has been immoralized by the Jesuits under the name of Don Justo Uobondo. Incidentally this event furnishes an index to the character of the Japanese samurai: he accepted the consequences of defeat as frankly as he dared it. In the same year (1564) the feudatory of Sawa, a brother of Takayama, became a Christian and imposed the faith on all his vassals, just as Sumitada and other feudal chiefs had done in Kiṭshū. But the Kijō record differs from that of Kiṭshū in one important respect—the former is free from any intrusion of commercial motives.

Kijō was at that time the scene of sanguinary tumults, which culminated in the murder of the shōgun (1565), and led to the issue of a decree by the emperor proscribing Christianity. In Japanese medieval history this was one of the only two instances of Imperial interference with Christian propagandism. There is evidence that the edict was obtained at the instance of one of the shōgun's assassins and certain Buddhist priests. The Jesuits—their number had been increased to three—were obliged to take refuge in Sakai, now little more than a suburb of Osaka, but at the time, a great and wealthy mart, and the only town in Japan which did not acknowledge the sway of any feudal chief. Three years later they were summoned thence to be presented to Oda Nobunaga, one of the greatest captains Japan has ever produced. In the very year of Xavier's landing at Kagoshima, Nobunaga had succeeded to his father's fief, a comparatively petty estate in the province of Owari. In 1568 he was seated in Kijō, a maker of shōguns and acknowledged ruler of 30 among the 66 provinces of Japan. Had Nobunaga, wielding such immense power, adopted a hostile attitude towards Christianity, the fires lit by the Jesuits in Japan must soon have been extinguished. Nobunaga, however, to great breadth and liberality of view added strong animosity towards Buddhist priests. Many of the great monasteries had become armed camps, their inmates skilled in field-attacks and in the defence of ramparts. One sect (the Nichiren), which was specially affected by the samurai, had lent powerful aid to the murderers of the shōgun three years before Nobunaga's visit. He carried him to Kijō, and the armed monasteries constituted *imperio in imperio* which assailed his ambition of complete supremacy; and therefore welcomed Christianity for the sake of its opposition to Buddhism, and when Takayama conducted Froez from Sakai to Nobunaga's presence, the reception accorded to the Jesuit was of the most cordial character. Throughout the fourteen years of life that remained to him, Nobunaga continued to be the constant friend of the missionaries in particular and of foreigners visiting Japan in general. He stood between the Jesuits and the Throne when, in reply to an appeal from the Buddhist priests, the emperor, for the second time, issued an anti-Christian decree (1568); he granted a site for a church and residence at Azuchi on Lake Biwa, where his new fortress stood; he addressed to various powerful feudatories letters signifying a desire for the spread of Christianity; he frequently made handsome presents to the fathers, and whenever they visited him he showed a degree of accessibility and graciousness foreign to his usually haughty and imperious demeanour. The Jesuits themselves said of him: "This man seems to have been chosen by God to open and prepare the way for our faith." Nevertheless they do not appear to have entertained much hope at any time of converting Nobunaga. They must have understood that their doctrines had not made any profound impression on a man who could treat them as this potestate did in 1579, when he plainly showed that political exigencies might at any moment induce him to sacrifice them.¹ His last act, too, proved that sacrilege was of no account in his eyes, for he took steps to have himself apotheosized at Azuchi with the utmost pomp and circumstance. Still nothing can obscure the benefits he heaped upon the propagandists of Christianity.

The terrible tumult of domestic war through which Japan passed in the 15th and 16th centuries brought to her service three of the greatest men ever produced in Hideyoshi the Occident or Orient. They were Oda Nobunaga, *the* Toyotomi Hideyoshi, and Tokugawa Ieyasu.

Hideyoshi, as Nobunaga's lieutenant, contributed largely to the building of the latter's fortunes, and, succeeding him in 1582, brought the whole 66 provinces of the empire under his own administrative sway. For the Jesuits now the absorbing question was, what attitude Hideyoshi would assume towards their propagandism. His power was virtually limitless. With a word he could have overthrown the whole edifice created by them at the cost of so much splendid effort and noble devotion. They were very quickly reassured. In this matter Hideyoshi walked in Nobunaga's footsteps. He not only accorded a friendly audience to Father Organista, who waited on him as representative of the Jesuits, but also he went in person to assign to the company a site for a church and a residence at Osaka, where there was presently to rise the most massive fortress ever built in the East. At that time many Christian converts were serving in high positions, and in 1584 the Jesuits placed it on record that Hideyoshi was not only not opposed to the things of God, but he even showed that he made much account of them and preferred them to all the sects of the bonzes. . . . He is entrusting to Christians his treasures, his secrets and his fortunes of most importance, and shows himself well pleased that the sons of the great lords about him should adopt our customs and our law." Two years later in Osaka he received with every mark of cordiality and favour a Jesuit mission which had come from Nagasaki seeking audience, and on that occasion his host recorded that he spoke of an intention of christianizing one-half of Japan. Nor did Hideyoshi confine himself to words. He actually signed a patent licensing the missionaries to preach throughout all Japan, and exempting not only their houses and churches from the billeting of soldiers but also the priests themselves from local burdens. This was in 1586, on the eve of Hideyoshi's greatest military enterprise, the siege of Kiṭshū and its complete reduction. He carried that difficult enterprise to completion by the middle of 1587, and throughout its course he maintained a uniformly friendly demeanour towards the Jesuits. But suddenly, when on the return journey he reached Hakata in the north of the island, his policy underwent a radical metamorphosis. Five questions were by his order propounded to the vice-provincial of the Jesuits: "Why and by what authority he and his fellow-propagandists had constrained Japanese subjects to become Christians? Why had they induced their disciples and their sectaries to overthrow temples? Why they persecuted the bonzes? Why they and other Portuguese ate animals useful to men, such as oxen and cows? Why the vice-provincial allowed merchants of his nation to buy Japanese cattle and make slaves of them in the Indies?" To these queries the vice-provincial, made answer that the missionaries had never threatened, resisted, or incited, to violence in their propagandism or persecuted bonzes; that if their eating of beef were considered inadmissible, they would give up the practice; and that they were powerless to prevent others the outrages perpetrated by their countrymen. Hideyoshi read the vice-provincial's reply and, without comment, sent him word to retire to Hirado, assemble all his followers there, and quit the country within six months. On the next day (July 26, 1587) the following edict was published:

¹ The problem was to induce the co-operation of a feudatory whose castle served for frontier guard to the seat of a powerful chief, his suzerain. The feudatory was a Christian. Nobunaga seized the Jesuits in Kiṭō, and threatened to suppress their religion altogether unless they persuaded the feudatory to abandon the cause of his suzerain.
"Having learned from our faithful councillors that foreign priests have come into our estates, where they preach a law contrary to that of Japan, and that they even had the audacity to destroy temples dedicated to our Kami and Hotoke; although the outrage merits the most extreme punishment, waging nevertheless to show them mercy, we order them under pain of death to quit Japan within twenty days. During that space no harm or hurt will be done to them. But at the expiration of that term, we order that if any of them be found in our states, they should be seized and punished as the greatest criminals. As for the Portuguese merchants, we permit them to enter our ports, there to continue their accustomed trade, and to remain in our states provided our affairs need this. But we forbid them to bring any foreign priests into the country, under the penalty of the confiscation of their ships and goods."

How are we to account for this apparently rapid change of mood on the part of Hideyoshi? Some historians insist that from the very outset he conceived the resolve of suppressing Christianity and expelling its propagandists, but that he concealed his design pending the subjugation of Kiūshū, lest, by premature action, he might weaken his hand for that enterprise. This hypothesis rests mainly on conjecture. Its formulators found it easier to believe in a hidden purpose than to attribute to a statesman so shrewd and far-seeing a sudden change of mind.

A more reasonable theory is that, shortly before leaving Osaka for Kiūshū, Hideyoshi began to entertain doubts as to the expediency of tolerating Christian propaganda, and that his doubts were signally strengthened by direct observation of the state of affairs in Kiūshū. While still in Osaka, he one day remarked publicly that "he feared much that all the virtue of the European priests served only to conceal pernicious designs against the empire." There had been no demolishing of temples or overthrowing of images at Christian instance in the metropolitan provinces. In Kiūshū, however, very different conditions prevailed. There Christianity may be said to have been preached at the point of the sword. Temples and images had been destroyed wholesale; vassals in thousands had been compelled to embrace the foreign faith; and the missionaries themselves had come to be treated as demi-gods whose nod was worth conciliating at any cost of self-abasement. Brought into direct contact with these evidences of the growth of a new power, temporal as well as spiritual, Hideyoshi may well have reached the conclusion that the Church had not only made himself an enemy to his nation and that of the alien creed, if not between the independence of Japan and the yoke of the great Christian states of Europe.

Hideyoshi gauged the character of the medieval Christians with sufficient accuracy to know that for the sake of their faith they would at any time defy the laws of the land. His estimate received immediate verification, for when the Jesuits, numbering 120, assembled at Hirado and received his order to embark at once they decided that only those should sail whose services were needed in China. The others remained and went about their duties as usual, under the protection of the converted feudatories Hideyoshi, however, saw reason to wink at this disregard of his authority. At first he showed uncompromising resolution. All the churches in Kiōto, Osaka and Sakai were demolished, while troops were sent to raze the Christian places of worship in Kiūshū and seize the port of Nagasaki. These troops were mutinously dissuaded from their purpose by the Christian feudatories. But Hideyoshi did not protest, and the Jesuits were permitted to continue in their work, while an order was transmitted to the missionaries foreign trade must cease, since without the intervention of the fathers peace and good order could not be maintained among the merchants. Rather than suffer the trade to be interrupted Hideyoshi agreed to the coming of priests, and thenceforth, during some years, Christianity not only continued to flourish and grow in Kiūshū but also found a favourable field of operations in Kiōto itself. Care was taken that Hideyoshi's attention should not be attracted by any salient evidences of what he had called a "diabolical religion," and thus for a time all went well. There is evidence that, like the feudal chiefs in Kiūshū, Hideyoshi set great store by foreign trade and would even have sacrificed its maintenance and expansion something of the aversion he had conceived for Christianity. He did indeed make one very large concession. For on being assured that Portuguese traders could not frequent Japan unless they found Christian priests there to minister to them, he consented to sanction the presence of a limited number of Jesuits. The statistics of 1595 show how Christianity fared under even this partial tolerance, for there were then 137 Jesuits in Japan with 300,000 converts, among whom were 17 feudal chiefs, to say nothing of many men of lesser though still considerable note, and even not a few bonzes.

For ten years after his unlooked-for order of expulsion, Hideyoshi preserved a tolerant mien. But in 1597 his forbearance gave place to a mood of uncompromising severity. Hideyoshi's Final

The reasons of this second change are very clear, though diverse accounts have been transmitted. Up to 1593 the Portuguese had possessed a monopoly of religious propaganda and over-sea commerce in Japan. The privilege was secured to them by agreement between Spain and Portugal and by a papal bull. But the Spaniards in Manila had long looked with somewhat showy success on the wealth of the cloisters of Kiūshū. and the disaster of 1597 reached the Philippines, the Dominicans and Franciscans residing there were fired with zeal to enter an arena where the crown of martyrdom seemed to be the least reward within reach. The papal bull, however, demanded obedience, and to overcome that difficulty a ruse was necessary: the governor of Manila agreed to send a party of Franciscans as ambassadors to Hideyoshi. In that guise the friars, being neither traders nor propagandists, considered that they did not violate either the treaty or the bull. It was a technical subterfuge very unworthy of the object contemplated, and the friars supplemented it by swearing to Hideyoshi that the Philippines would submit to his sway. Thus they obtained permission to visit Kiōto, Osaka and Fushimi, but with the explicit proviso that they must not preach. Very soon they had built a church in Kiōto, consecrated it with the utmost pomp, and were preaching sermons and chanting litanies there in flagrant defiance of Hideyoshi's veto. Presently their number received an access of three friars who came bearing gifts from the governor at Manila, and now they not only established a cloister in Fushimi, but dispatched officers to audience and confiscated and converted the circumspect worship hitherto conducted there by the fathers into services of the most public character. Officially checked in Nagasaki, they charged the Jesuits in Kiōto with having intrigued to impede them, and they further vaunted the courageous openness of their own ministrations as compared with the clandestine timidity of the methods which wise prudence had induced the Jesuits to adopt. Retribution would have followed quickly had not Hideyoshi's attention been engrossed by an attempt to invade China through Korea. At this stage, however, a memorable incident occurred. Driven out of her course by a storm, a great and richly laden Spanish galleon, bound for Acapulco from Manila, drifted to the coast of Tosa province, and running—or being purposely run—on a sand-bank as she was being towed into port by Japanese boats, broke her back. She carried goods to the value of some 600,000 crowns, and certain officials urged Hideyoshi to confiscate her as a derelic, conveying to him at the same time a detailed account of the doings of the Franciscans and their open flouting of his edicts. Hideyoshi, much incensed, commanded the arrest of the Franciscans, and dispatched officers to Nagasaki to confiscate the "San Felipe." The pilot of the galleon sought to intimidate these officers by showing them on a map of the world the vast extent of Spain's dominions, and being asked how one country had acquired such extended sway, replied: "Our kings begin by sending into the countries they wish to conquer missionaries who induce the people to embrace our religion, and when they have made considerable progress, troops are sent who combine with the new Christians, and then our kings have not much trouble in accomplishing the rest."
On learning of this speech Hideyoshi was overcome with fury. He condemned the Franciscans to have their noses and ears cut off, to be promenaded through Kioto, Osaka and Sakai, and to be crucified at Nagasaki. "I have ordered these foreigners to be treated thus, because they have come from the Philippines to Japan, calling themselves ambassadors, although they were not so; because they have remained here far too long without my permission; because, in defiance of my prohibition, they have built churches, preached their religion and caused disorders." Twenty-six suffered under this sentence—six Franciscans, three Japanese Jesuits and seventeen native Christians, chiefly domestic servants of the Franciscans. They met their fate with noble fortitude. Hideyoshi further issued a special injunction against the adoption of Christianity by a feudal chief, and took steps to give practical effect to his expulsion edict of 1587. The governor of Nagasaki had condemned their country to a period of internment, permitting only two or three to remain for the service of Portuguese merchants. But the Jesuits were not the kind of men who, to escape personal peril, turn their back upon an unaccomplished work of grace. There were 129 of them in Japan at that time. In October 1597 a junk sailed out of Nagasaki harbour, her decks crowded with seeming Jesuits. In reality she carried 11 of the company, the apparent Jesuits being disguised sailors. It is not to be supposed that such a manoeuvre could be hidden from the local authorities. They winked at it, until rumour became insistant that Hideyoshi was about to visit Kishū in person, and all Japanese in administrative posts knew how Hideyoshi visited disobedience and how hopeless was any attempt to deceive him. Therefore, early in 1598, drastic steps were taken. Churches to the number of 137 were demolished in Kishū, seminaries and residences fell, and the governor of Nagasaki assembled there all the fathers of the company for deportation to Macao by the great ship in the following year. But while they waited, Hideyoshi died. It is not on record that the Jesuits openly declared his removal from the earth to have been a special dispensation in their favour. But they pronounced him an excercable tyrant and consigned his "soul to hell for all eternity." Yet no impartial reader of history can pretend to think that a 16th-century Jesuit general in Hideyoshi's place would have shown towards an alien creed and its propagandists even a small measure of the tolerance exercised by the Japanese statesman towards Christianity and the Jesuits.

Hideyoshi's death occurred in 1598. Two years later, his authority as administrative ruler of all Japan had passed into the hands of Ieyasu, the Tokugawa chief, and thirty-nine years later the Tokugawa potentates had not only exterminated Christianity in Japan but had accomplished that measure of national isolation which continued unbroken until 1853, an interval of 214 years. It has been shown that even when they were most incensed against Christianity, Japanese administrators sought to foster and preserve foreign trade. Why then did they close the country's doors to the outside world and suspend a commerce once so much esteemed? To answer that question some retrospection is needed. Certain historians argue that from the outset Ieyasu shared Hideyoshi's misgivings about the real designs of Christian potentates and Christian propagandists. But that verdict is not supported by facts. The first occasion of the Tokugawa chief's recorded contact with a Christian propagandist was less than three months after Hideyoshi's death. There was then led into his presence a Franciscan, by name Jerome de Jesus, originally a member of the fictitious embassy from Manila. This man's conduct constitutes an example of the invincible zeal and courage inspiring a Christian priest in those days. Barely escaping the death of crucifixion which overtook his companions, he had been deported from Japan to Manila at a time when death seemed to be the certain penalty of remaining. But no sooner had he been landed at Manila than he took passage in a Chinese junk, and, returning to Nagasaki, made his way secretly from the far south of Japan to the province of Ki. There arrested, he was brought into the presence of Ieyasu, and his own record of what ensued is given in a letter subsequently sent to Manila:

"When the Prince saw me he asked how I had managed to escape the previous persecution. I answered him that at that date God had delivered me in order that I might go to Manila and bring back new colleagues from there—preachers of the divine law—and that I had availed from Manila to encourage the Prince to satisfy his desire to die on the cross in order to go to enjoy eternal glory like my former colleagues. On hearing these words the Emperor began to smile, whether in his quality of a pagan of the sect of Shaka, which teaches that there is no future life, or whether from the thought that I was frightened at having to be put to death. Then, looking at me kindly, he said, 'Be no longer afraid and no longer conceal yourself, and no longer change your habit, for I wish you well; and as for the Christians who every year pass within sight of the Kwantō, where my domains are, when they go to Mexico with their ships, I have a keen desire for them to visit the harbours of this island, to refresh themselves there, and to take what they wish to trade with us, and to have them teach us to make silver mines; and that my intentions may be accomplished before my death, I wish you to indicate to me the means to take to realize them.' I answered that it was necessary that Spanish pilots should take the soundings of these harbours in secret, so that no Chinese might know. 'San Felipe' had been, and that he should solicit this service from the governor of the Philippines. The Prince approved of my advice, and accordingly he sent a Japanese gentleman, a native of Sakai, with this message of this matter. This man was essential to oppose no obstacle to the complete liberty offered by the Emperor to the Spaniards and to our holy order, for the preaching of the holy gospel. ... The same Prince (who is about to visit the Kwantō) invites me to accompany him and to make choice of a house, and to visit the harbour which he promises to open to us; his desires in this respect are keener than I can express."

The above version of the Tokugawa chief's mood is confirmed by events, for not only did he allow the contumelious Franciscan to build a church—the first—in Yedo and to celebrate Mass there, but he also sent three embassies to the Philippines, proposing reciprocal freedom of commerce, offering to open ports in the Kwantō and asking for competent naval architects. He never obtained the architects, and though the trade came, its volume was small in comparison with the abundance of friars that accompanied it. There is just a possibility that Ieyasu saw in these Spanish monks an instrument of counteracting the influence of the Jesuits, for he must have known that the Franciscans opened their mission in Yedo by "declaring with violence against the fathers of the company of Jesus." In short, the Spanish monks assumed towards the Jesuits in Japan the same intolerant and abusive tone that the Jesuits themselves had previously assumed towards Buddhists.

At that time there appeared upon the scene another factor destined greatly to complicate events. It was a Dutch merchant ship, the "Liefde." Until the Netherlands revolted from Spain, the Dutch had been the principal distributors of all goods arriving at Lisbon from the Far East; but in 1594 Philip II. closed the port of Lisbon to these rebels, and the Dutch met the situation by turning their prows to the Orient to invade the sources of Portuguese commerce. One of the first expeditions despatched for that purpose set out in 1598, and of the five vessels composing it one only was ever heard of again. This was the "Liefde." She reached Japan during the spring of 1600, with only four-and-twenty alive out of her original crew of 110. Towed into the harbour at Funai, the "Liefde" was visited by Jesuits, who, on discovering her nationality, denounced her to the local authorities as a pirate and endeavoured to incense the Japanese against them. The "Liefde" had on board in the capacity of "pilot major" an Englishman, Willem Adams, who had been in my vassals and to teach them how to develop silver mines; and that my intentions may be accomplished before my death, I wish you to indicate to me the means to take to realize them."

The Englishman became master ship-builder to the Yedo government; was employed as diplomatic agent when other traders from his own country}

---

1. The mutilation was confined to the lobe of one ear. Crucifixion, according to the Japanese method, consisted in tying to a cross and piercing the heart with two sharp spears driven from either side. Death was always instantaneous.
and from Holland arrived in Japan, received in perpetual gift a substantial estate, and from first to last possessed the implicit confidence of the shōgun. Ieyasu quickly discerned the man's honesty, perceived that whatever benefits foreign commerce might confer would be increased by encouraging competition among the foreigners, and realized that English and Dutch trade presented the wholesome feature of complete dissociation from religious propaganda. On the other hand, he showed no intolerance to either Spaniards or Portuguese. He issued (1601) two official patents sanctioning the residence of the fathers in Kioto, Osaka and Nagasaki; he employed Father Rodriguez as interpreter to the court at Yedo; and in 1603 he gave munificent succour to the Jesuits who were reduced to dire straits owing to the capture of the great ship from Macao by the Dutch and the consequent loss of several years' supplies for the mission in Japan.

It is thus seen that each of the great trio of Japan's 16th-century statesmen—Nobunaga, Hideyoshi and Ieyasu—adopted at the outset a most tolerant demeanour towards Christianity. The reasons of Hideyoshi's change of mood have been set forth. We have now to examine the reasons that produced a similar metamorphosis in the case of Ieyasu. Two causes present themselves immediately. The first is, that, while tolerating Christianity, Ieyasu did not approve of it as a creed; the second, that he himself, whether from state policy or genuine piety, strongly encouraged Buddhism. Proof of the former proposition is found in an order issued by him in 1602 to insure the safety of foreign merchants entering Japanese ports: it concluded with the reservation, "but we rigorously forbid them " (foreigners coming in such ships) " to promulgate their faith." Proof of the latter is furnished by the facts that he invariably carried with him a miniature Buddhist image which he regarded as his tutelary deity, and that he fostered the creed of Shaka so zealously as Oda Nobunaga had suppressed it. There is much difficulty in tracing the exact sequence of events which gradually educated a strong antipathy to the Christian faith in the mind of the Tokugawa chief. He must have been influenced in some degree by the views of his great predecessor, but he did not accept them implicitly. At the end of the 17th century he sent a trusted emissary to Europe for the purpose of directly observing the conditions in the home of Christianity, and this man, the better to achieve his aim, embraced the foreign faith, and studied it from within as well as from without. The story that he had to tell on his return could not fail to shock the ruler of a country where freedom of conscience had existed from time immemorial. It was a story of the inquisition and of the stake; of unlimited aggression in the name of the cross; of the pope's overlordship which entitled him to confiscate the realm of heretical sovereigns; of religious wars and of wellnigh incredible fanaticism. Ieyasu must have received an evil impression while he listened to his emissary's statements. Under his own eyes, too, were abundant evidences of the spirit of strife that Christian dogma engendered in those times. From the moment when the Franciscans and Dominicans arrived in Japan, a fierce quarrel began between the pope and the Jesuits; a quarrel which even community of suffering could not compose. Not less repellent was an attempt on the part of the Spaniards to dictate to Ieyasu the expulsion of all Hollanders from Japan, and on the part of the Jesuits to dictate the expulsion of the Spaniards. The former proposal, couched almost in the form of a demand, was twice formulated, and accompanied on the second occasion by a scarcely less insulting offer, namely, that Spanish men-of-war would be sent to Japan to burn all Dutch ships found in the ports of the empire. If in the face of proposals so contumelious of his sovereign authority Ieyasu preserved a calm and dignified mien, merely replying that his country was open to all comers, and that, if other nations had quarrels among themselves, they must not take Japan for battle-ground, it is nevertheless unimaginable that he did not strongly resent such interference with his own independent foreign policy, and that he did not interpret it as foreshadowing a disturbance of the realm's peace by sectarian quarrels among Christians. These experiences, predisposing Ieyasu to dislike Christianity as a creed and to distrust it as a political influence, were soon supplemented by incidents of an immediately determinative character. The first was an act of fraud and forgery committed in the interests of a Christian feudatory by a trusted official, himself a Christian. Thereupon Ieyasu, conceiving it unsafe that Christians should fill offices at his court, dismissed all those so employed, banished them from Yedo and forbade any feudal chief to harbour them. The second incident was an attempted survey of the coast of Japan by a Spanish mariner and a Franciscan friar. Permission to take this step had been obtained by an envoy from New Spain, but no deep consideration of reasons seems to have preceded the permission on Japan's side, and when the mariner (Sebastian) and the friar (Sotelo) hastened to carry out the project, Ieyasu asked Will Adams to explain this display of industry. The Englishman replied that such a proceeding would be regarded in Europe as an act of hostility, especially on the part of the Spaniards or Portuguese, whose aggressions were notorious. He added, in reply to further questions, that the Roman priesthood had been expelled from many parts of the world, from Sweden, Norway, Denmark, Holland and England, and that although his own country preserved the pure form of the Christian faith from which Spain and Portugal had deviated, yet neither English nor Dutch considered that fact afforded them any reason to war with, or to annex, States which were not Christian solely for the reason that they were non-Christian. Ieyasu reposed entire confidence in Adams. Hearing the Englishman's testimony, he is said to have exclaimed, "If the sovereigns of Europe do not tolerate these priests, I do them no wrong if I refuse to tolerate them." Japanese historians add that Ieyasu discovered a conspiracy on the part of some Japanese Christians to overthrow his government by the aid of foreign troops. It was not a widely ramified plot, but it lent additional importance to the fact that the sympathy of the fathers and their converts was plainly with the only magnate in the empire who continued to dispute the Tokugawa supremacy, Hideyori, the son of Hideyoshi. Possibly Ieyasu shrank from proceeding to extremities in the case of any foreign priest, and this attitude he maintained until his death (1616). Possibly he might have been not less tolerant towards native Christians also had not the Tokugawa authority been openly defied by a Franciscan father—the Sotelo mentioned above—in Yedo itself. Then (1613) the first execution of Japanese converts took place, though the monk himself was released after a short incarceration. At that time, as is still the case even in these more enlightened days, insignificant differences of custom sometimes induced serious misconceptions. A Christian who had violated the secular law was crucified in Nagasaki. Many of his fellow-believers kneeled around his cross and prayed for the peace of his soul. A party of converts were afterwards burned to death in the same place for refusing to apostatize, and their Christian friends crowded to carry off portions of their bodies as holy relics. When these things were reported to Ieyasu, he said, "Without doubt that must be a diabolic faith which persuades people not only to worship criminals condemned to death for their crimes, but also to honour those who have been burned or cut in pieces by the order of their lord." (feudal chief).

The fateful edict ordering that all foreign priests should be collected in Nagasaki preparatory to removal from Japan, that all churches should be demolished, and that the Suppressing converts should be compelled to abjure Christianity, of which was issued on the 27th of January 1614. There were then in Japan 122 Jesuits, 14 Franciscans, 9 Dominicans, 4 Augustins and 7 secular priests. Had these men obeyed the orders of the Japanese authorities by leaving the country finally, not one foreigner would have suffered for his faith in Japan, except the 6 Franciscans executed at Nagasaki by order of Hideyoshi in 1597. But suffering and death counted for nothing with the missionaries as against the possibility of winning or keeping even one convert. Forty-seven of them evaded the
edict, some by concealing themselves at the time of its issue, the rest by leaving their ships when the latter had passed out of sight of the shore of Japan, and returning by boats to the scene of their former labours. Moreover, in a few months, those that had actually crossed the sea re-crossed it in various disguises, and soon the Japanese government had to consider whether it would suffer its authority to be thus flouted or resort to extreme measures.

During two years immediately following the issue of the anti-Christian decree, the attention of the Tokugawa chief and indeed of all Japan was concentrated on the closing episode of the great struggle which assured to Ieyasu final supremacy as administrative ruler of the empire. That episode was a terrible battle under the walls of Osaka castle between the adherents of the Tokugawa and the supporters of Hideyori. In this struggle fresh fora were added to those of former times, for many Christian converts threw in their lot with Hideyori, and in one part of the field the Tokugawa troops found themselves fighting against a foe whose banners were emblazoned with the cross and with images of the Saviour and St James, the patron saint of Spain. But the Christians had protectors. Many of the feudatories showed themselves strongly averse from inflicting the extreme penalty on men and women whose adoption of an alien religion had been partly forced by the feudatories themselves. As for the people at large, their liberal spirit is attested by the fact that five fathers who were in Osaka castle at the time of its capture made their way to distant refuges without encountering any risk of betrayal. During these events the death of Ieyasu took place (June 1, 1616), and pending the dedication of his mausoleum the anti-Christian crusade was virtually suspended.

In September 1616 a new anti-Christian edict was promulgated by Hidetada, son and successor of Ieyasu. It pronounced sentence of exile against all Christian priests, including even those whose presence had been sanctioned for ministering to the Portuguese merchants: it forbade the Japanese, under the penalty of being burned alive and of having all their property confiscated, to have any connexion with the ministers of religion or to give them hospitality. It was forbidden to any prince or lord to keep Christians in his service or even on his estates, and the edict was promulgated with more than usual solemnity, though its enforcement was deferred until the next year on account of the obsequies of Ieyasu. This edict of 1616 differed from that issued by Ieyasu in 1614, since the latter did not prescribe the death penalty for converts refusing to apostatize. But both agreed in indicatively expulsion as the sole manner of dealing with the foreign priests. As for the shōgun and his advisers, it is reasonable to assume that they did not anticipate much necessity for recourse to violence. They must have known that a great majority of the converts had joined the Christian church at the instance or by the command of their local rulers, and nothing can have seemed less likely than that a creed thus lightly embraced would be adhered to in defiance of torture and death. It is merely morally certain that all the foreign propagandists obeys the Government's edict and left the country, not one would have been put to death. They suffered because they defied the laws of the land. Some fifty missionaries happened to be in Nagasaki when Hidetada's edict was issued. A number of these were apprehended and deported, but several of them returned almost immediately. This happened under the jurisdiction of Omura, who had been specially charged with the duty of sending away the baten or padres. He appears to have concluded that a striking example must be furnished, and he therefore ordered the seizure and decapitation of two fathers, De' Assumpcion and Machado. The result completely falsified his calculations, and presaged the cruel struggle now destined to begin.

The bodies, placed in different coffins, were interred in the same grave. Guards were placed over it, but the concourse was immense. The boyolas were carrried to the sepulchre to be restored to health. The Christians found new strength in this martyrdom: the pagans themselves were full of admiration for it. Numerous conversions and numerous returns of apostates took place everywhere.

In the midst of all this, Navarette, the vice-provincial of the Dominicans, and Ayala, the vice-provincial of the Augustins, came out of their retreat, and in full priestly garb started upon an open propaganda. The two fanatics—for so even Charlevoix considers them to have been—were secretly conveyed to the island Takashima and there decapitated, while their coffins were weighted with big stones and sunk in the sea. Even more directly defiant was the attitude of the new martyred priest, an old Franciscan monk, Juan de Santa Martha. He had for three years suffered all the horrors of a medieval Japanese prison, when it was proposed to release him and deport him to New Spain. His answer was that, if released, he would stay in Japan and preach there. He laid his head on the block in August 1618. But from that time until 1622 no other foreign missionary suffered capital punishment in Japan, though many of them arrived in the country and continued their propaganda there. During that interval, also, there occurred another incident eminently calculated to fix upon the Christians still deeper suspicion of political designs. In a Portuguese ship captured by the Dutch a letter was found instigating the Japanese converts to revolt, and promising that, when the number of these disaffected Christians was sufficient, men-of-war would be sent to aid them. Not the least potent of the influences operating against the Christians was that pamphlets were written by apostates attributing the zeal of the foreign propagandists solely to political motives. Yet another indictment of Spanish and Portuguese propagandists was contained in a despatch addressed to Hidetada in 1620 by the admiral in command of the British and Dutch fleet then cruising in Far-Eastern waters. In that document the friars were flatly accused of treacherous designs, and the Japanese ruler was warned against the aggressive designs of Philip of Spain. In the face of all this evidence the Japanese ceased to hesitate, and a time of terror ensued for the fathers and their converts. The measures adopted towards the missionaries gradually increased in severity. In 1617 the first two fathers put to death (De' Assumpcion and Machado) were beheaded, "not by the common executioner, but by one of the first officers of the prince." Subsequently Navarette and Ayala were decapitated by the executioner. Then, in 1618, Juan de Santa Martha was executed like a common criminal, his body being dismembered and his head exposed. Finally, in 1622, Zuñiga and Flores were burnt alive. The same year was marked by the "great martyrdom" at Nagasaki when 9 foreign priests went to the stake with 19 Japanese converts. The shōgun seems to have been now labouring under vivid fear of foreign invasion. An embassy sent to Europe had returned on the eve of the "great martyrdom" after seven years abroad, and had made a report more than ever unfavourable to Christianity. Therefore Hidetada deemed it necessary to refuse audience to a Philippine embassy in 1624 and to deport all Spaniards from Japan. Further, it was decreed that no Japanese Christian should thenceforth be suffered to go abroad for commerce, and that though non-Christians or men who had apostatized might travel freely, they must not visit the Philippines. Thus ended all intercourse between Japan and Spain. It had continued for 32 years and had engendered a widespread conviction that Christianity was an instrument of Spanish aggression.

Iyemitsu, son of Hidetada, now ruled in Yedo, though Hidetada himself remained the power behind the throne. The year (1622) of the former's accession to power had been marked by the re-issue of anti-Christian decrees, and by the martyrdom of some 500 Christians within the Tokugawa domains, whither the tide of persecution now flowed for the first time. Thenceforth the campaign was continuous. The men most active and most relentless in carrying on the persecution were Mizuno and Takenaka, governors of Nagasaki, and Matsukura, feudatory of Shimabara. By the latter were invented the punishment of throwing converts into the solfatars at Unzen and the torture of the fosse, which consisted in suspension by the feet, head downwards, in a pit until blood oozed from the mouth, nose and ears. Many endured this latter torture for days, until death
came to their relief, but a few—particularly the Jesuit provincial Ferreyra—apostatized. Matsukura and Takenaka were so strongly obsessed by the Spanish menace that they contemplated the conquest of the Philippines in order to deprive the Spaniards of a Far-Eastern base. But timid counsels then prevailed in Yedo, where the spirit of a Nobunaga, a Hideyoshi or an Ieyasu no longer presided. Of course the measures of repression grew in severity as the fortitude of the Christians became more obdurate. It is not possible to state the exact number of victims. Some historians say that, down to 1615, no fewer than 280,000 were punished, but that figure is probably exaggerated, for the most trustworthy records indicate that the converts never aggregated more than 300,000, and many of these, if not a great majority, having accepted the foreign faith very lightly, doubtless discarded it readily under menace of destruction. Every opportunity was given for apostatizing and for escaping death. Immunity could be secured by pointing out a fellow-convert, and when it is observed that among the seven or eight feudatories who embraced Christianity only two or three died in that faith, we must conclude that not a few cases of recanting occurred among the commoners. Remarkable fortitude, however, is said to have been displayed. If the converts were intrepid their teachers showed no less courage. Again and again the latter defied the Japanese authorities by coming to the country or returning thither after having been deported. Ignoring the orders of the governors of Macao and Manila and even of the king of Spain himself, they arrived, year after year, to be certainly apprehended and sent to the stake after brief periods of propagandism. In 1626 they actually baptized over 3000 converts. Large rewards were paid to anyone denouncing a propagandist, and as for the people, they had to trample upon a picture of Christ in order to prove that they were not Christians.

Meanwhile the feuds between the Dutch, the Spaniards and the Portuguese never ceased. In 1636, the Dutch found on a captured Portuguese vessel a report of the governor of Macao describing a two days' festival which had been held there in honour ofVari, the vice-provincial whose martyrdom had just taken place in Japan. This report the Dutch handed to the Japanese authorities in order that his majesty may see more clearly what great honour the Portuguese pay to those he has forbidden his realm as traitors to the state and to his crown." Probably the accusation added little to the resentment and distrust already harboured by the Japanese government. At all events the Yedo government took no step distinctly hostile to Portuguese laymen until 1637, when an edict was issued forbidding any foreigners to travel in the empire, lest Portuguese with passports bearing Dutch names might enter it. This was the beginning of the end. In the last month of 1637 a rebellion broke out, commonly called the "Christian revolt of Shimabara," which sealed the fate of Japan's foreign intercourse for over 200 years.

The promontory of Shimabara and the island of Amakusa enclose the Gulf of Nagasaki on the west. Among all the sites in Japan, Shimabara and Amakusa had been the two most thoroughly christianized in the early years of Jesuit propagandism. Hence in later days they were naturally the scene of the severest persecutions. Still the people would probably have suffered in silence had they not been taxed beyond all endurance to supply funds for an extravagant chief who employed savage methods of extortion. Japanese annals, however, relegate the taxation grievance to an altogether secondary place, and attribute the revolt solely to the instigation of a five samurai who led a raving life to avoid persecution for their adherence to Christianity. Whichever version be correct, it is certain that the outbreak ultimately attracted all the Christians from the surrounding regions, and was regarded by the authorities as in effect a Christian rising. The Amakusa insurgents passed over to Shimabara, and on the 27th of January 1638 the whole body—numbering, according to some authorities, 20,000 fighting men with 17,000 women and children; according to others, little more than one-half of these figures—took possession of the dilapidated castle of Hara, which stood on a plateau with three sides descending perpendicularly to the sea, a hundred feet beneath, and with a fourth front. There the insurgents, who fought under flags with crossed sabres of whose battle cries were "Jesus," "Maria" and "St. Lago," successfully maintained themselves against the repeated assaults of strong forces until the 12th of April, when, their ammunition and their provisions alike exhausted, they were overwhelmed and put to the sword, with the exception of 105 prisoners. During the siege the Dutch were enabled to furnish a vivid proof of enmity to the Christianity of the Spaniards and the Portuguese. For the guns in possession of the besiegers being too light to accomplish anything, Koeckebaker, the factor at Hirado, was invited to send ships carrying heavier metal. He replied with the "de Ryp" of 20 guns which threw 426 shot into the castle in 15 days. Probably the great bulk of the remaining Japanese Christians perished at the massacre of Hara. Thenceforth there were few martyrs.

It has been clearly shown that Nobunaga, Hideyoshi and Ieyasu were all in favour of foreign intercourse and trade, and that the Tokugawa chief, even more than his predecessor, defied the Portuguese, desired most earnestly to hear the Portuguese to the Christian and commerce, so that the latter might not be involved in the former's fate. In fact the three objects which Ieyasu desired most earnestly to compass were the development of foreign commerce, the acquisition of a mercantile marine and the exploitation of Japan's mines. He offered the Spaniards, Portuguese, English and Dutch a site for a settlement in Yedo, and had they accepted the offer the country might never have been closed. In his time Japan was virtually a free-trade country. Importers had not to pay any duties. It was expected, however, that they should make presents to the feudal lord whose port they carried their goods, and these presents were often very valuable. Naturally the Tokugawa chief desired to attract such a source of wealth to his own domain. If sent more than one envoy to Manila to urge the opening of commerce direct with the regions about Yedo, and to ask the Spaniards for competent naval architects. Perhaps the true exposition of his attitude is given in a law enacted in 1602:

"If any foreign vessel by stress of weather is obliged to touch at any principality or to put into any harbour of Japan, we order that, whoever these foreigners may be, absolutely nothing whatever that belongs to them or that they may have brought in their ship, shall be allowed to them. Likewise we rigorously prohibit any violence in the purchase or the sale of any of the commodities brought by their ship, and if it is not convenient for the merchants of the ship to remain in the port they have entered, they may pass to any other port that may suit them, and therein buy and sell in full freedom. Likewise we order in a general manner that foreigners may freely reside in any part of Japan they choose, but we rigorously forbid them to promote their faith.'

It was in that mood that he granted (1605) a licence to the Dutch to trade in Japan, his expectation doubtless being that the ships which they promised to send every year would make their dépôt at Uraga or in some other place nearby Yedo. But things were ordered differently. The first Hollanders that set foot in Japan were the survivors of the wrecked "Liefde." Thrown into prison for a time, they were approached by emissaries from the feudal lord of Hirado, who engaged some of them to teach the art of casting guns and the science of gunnery to his vassals, and when two of them were allowed to leave Japan, he furnished them with the means of doing so, at the same time making promises which installed Hirado with attractions as a port of trade, though it was then and always remained an insignificant fishing village. The Dutch possessed precisely the qualifications suited to the situation then existing in Japan: they had commercial potentialities without any religious associations. Fully appreciating that fact, the shrewd feudal lord of Hirado laid himself out to entice the Dutchmen to his fief, and he succeeded. Shortly afterwards, an incident occurred which clearly betrayed the strength of the Tokugawa chief's desire to

1See A History of Christianity in Japan (1910), by Otis Cary.
explore Japan's mines. The governor-general of the Philippines (Don Rodrigo Vivero y Velasco), his ship being cast away on the Japanese coast on a voyage to Acapulco, was recaptured by Ieyasu, and in response to the latter's request for fifty Spanish vessels, the Spaniard formulated terms to which Ieyasu actually assented, that half the produce of the mines should go to the miners; that the other half should be divided between Ieyasu and the king of Spain; that the latter might send commissioners to Japan to look after his mining interests, and that these commissioners might be accompanied by priests who would be entitled to have public churches for holding services. This was in 1600, when the Tokugawa chief had again and again imposed the strictest veto on Christian propaganda. There can be little doubt that he understood the concession made to Don Rodrigo in the sense of Hideyoshi's mandate to the Jesuits in Nagasaki, namely, that a sufficient number might remain to minister to the Portuguese traders frequenting the port. Ieyasu had confidence in himself and in his countrymen. He knew that emergencies could be dealt with when they arose and he sacrificed nothing to timidity. But his courageous policy died with him and the miners did not come. Neither did the Spaniards ever devote any successful efforts to establishing trade with Japan. Their vessels paid a few visits to Uraga, but the Portuguese continued to monopolize the commerce.

In 1611 a Dutch merchantman (the "Brach") reached Hirado with a cargo of pepper, cloth, ivory, silk and lead. She carried two envoys, Speck and Segerszon, and in the vain hope of a face of a Spanish embassy which had just arrived from Manila expressly for the purpose of "settling matters regarding the Hollanders," the Dutchmen obtained a liberal patent from Ieyasu. Twelve years previously, the merchants of London, stimulated generally by the success of the Dutch in trade with the East, and specially by the fact that these Hollanders had raised the price of pepper against us from 3 shillings per pound to 6 shillings and 8 shillings, organized the East India Company which immediately began to send ships eastward. Of course the news that the Dutch were about to establish a trading station in Japan reached London speedily, and the East India Company lost no time in ordering among their vessels, the "Clave," under Captain Saris, to proceed to the Far-Eastern islands. She carried a quantity of pepper and on the voyage she endeavoured to procure some spices at the Moluccas. But the Dutch would not suffer any poisoning of their valuable monopoly. The "Clave," under Captain Saris, entered Hirado on the 11th of June 1613. Saris seems to have been a man self-opinionated, of shallow judgment and suspicious. Though strongly urged by William Adams to make Uraga the seat of the new trade, though convinced of the excellence of the harbour there, and though instructed as to the great advantage of proximity to the shogun's capital, he appears to have conceived some distrust of Adams, for he chose Hirado. From Ieyasu, Captain Saris received a most liberal charter, which plainly displayed the mood of the Tokugawa shogun towards foreign trade:

1. The ship that has now come for the first time from England over the sea to Japan may carry on trade of all kinds without hindrance. With regard to future visits (of English ships) permission will be given in regard to all matters.
2. With regard to the cargoes of ships, requisition will be made by list according to the requirements of the shogunate.
3. English ships are free to visit any port in Japan. If disabled by storm, they may put into any harbour and remain.
4. Ground in Yedo in the place which they may desire shall be given to the English, and they may erect houses and reside and trade there. They shall be at liberty to return to their country whenever they may desire, it shall be done so, and to dispose as they like of the houses they have erected.
5. If an Englishman dies in Japan of disease, or any other cause, his effects shall be handed over without fail.
6. Forced sales of cargo, and violence, shall not take place.
7. If one of the English should commit an offence, he should be sentenced by the English General according to the gravity of his offence.

(Translated by Professor Riess.)

The terms of the 4th article show that the shogun expected the English to make Yedo their headquarters. Had Saris done so, he would have been free from all competition, would have had an immense market at his very doors, would have economized the expense of numerous overland journeys to the Tokugawa court, and would have saved the payment of many "considerations." The result of his mistaken choice and subsequent bad management was that, ten years later (1623), the English factory at Hirado had to be closed, having incurred a total loss of about £2000. In compensation of this failure it must be noted that a few months after the death of Ieyasu, the charter he had granted to Saris underwent serious modification. The original document threw open to the English every port in Japan; the revised document limited them to Hirado. But this restriction may be indirectly traced to the blunder of not accepting a settlement in Yedo and a port at Uraga. For the Tokugawa's foreign policy was largely swayed by an apprehension lest the Christian feudatories, over whom the authority of Yedo had never been fully established, might, by the presence of foreign traders, come into possession of such a fleet and such an armament as would ultimately enable them to wrest the administration of the empire from Tokugawa hands. Hence the precaution of confining the English and the Dutch to Hirado, the fief of a daimyo too petty to become formidable, and to Nagasaki which was an imperial city. But evidently an English factory in Yedo and English ships at Uraga would have strengthened the Tokugawa ruler's hand instead of supplying engines of war to his political foes. It must also be noted that the question of locality had another injurious outcome. It exposed the English—and the Dutch also—to crippling competition at the hands of a company of rich Osakan monopolists, who, as representing an Imperial city and therefore being pledged to the Tokugawa interests, enjoyed Yedo's favour and took full advantage of it. These shrewd traders not only drew a ring round Hirado, but also sent vessels on their own account to Cochin China, Siam, Tonkin, Cambodia and other places, where they obtained many of the staples in which the English and the Dutch dealt. Such a closure of the English factory at Hirado was purely voluntary. From first to last there had been no serious friction between the English and the Japanese. The company's houses and godowns were not sold. These as well as the charter were left in the hands of the shogun, who promised to restore them should the English re-open business in Japan. The company did think of doing so on more than one occasion, but no practical step was taken until the year 1673, when a merchantman, aptly named the "Return," was sent to seek permission. The Japanese, after mature reflection, made answer that as the king of England was married to a Portuguese princess, British subjects could not be permitted to visit Japan. That this reply was suggested by the Dutch is very probable; that it truly reflected the feeling of the Japanese government towards Roman Catholics is certain. The Spaniards were expelled from Japan in 1624, the Portuguese in 1638. Two years before the latter event, the Yedo government took a signally retrogressive step. They ordained that no Japanese vessel should go abroad; that no Japanese subject should leave the country, and that, if detected attempting to do so, he should be put to death, the vessel that carried him and her crew being seized "to await our pleasure"; that the Japanese resident abroad should be executed if he returned; that the children and descendants of Spaniards together with those who had adopted such children should not be allowed to remain on pain of death; and that no ship of ocean-going dimensions should be built in Japan. Thus not only were the very children of the Christian propagandists driven completely from the land, but the Japanese people also were sentenced to imprisonment within the limits of their islands, and the country was deprived of all hope of acquiring a mercantile marine. The descendants of the Spaniards, banished by the edict, were taken to Macao in two Portuguese galleons. They numbered 287 and the property of the Imperial cities were Yedo, Kioto, Osaka and Nagasaki. They were also introduced to Kagoshima by the Shimazu chief, and, had not their experience at Hirado proved so deterrent, they might have established a factory at Kagoshima.
FOREIGN INTERCOURSE

JAPAN

they carried; with them aggregated 6,097,500 florins. But if the Portuguese derived any gratification from this sweeping out of their market, their feelings were destined to be short-lived. Already they were subjected to humiliating restrictions.

"From 1623 the galleons and their cargoes were liable to be burnt and their crews executed if any foreign priest was found on board of them. An official of the Japanese government was stationed in Macao for the purpose of inspecting all intending passengers, and of preventing any person not suspiciously regarded as priests from proceeding to Japan. A complete list and personal description of every one on board was drawn up by this officer, a copy of it was handed to the captain and by him it had to be delivered to the authorities who met him at Nagasaki before he was allowed to anchor. If in the subsequent voyage, a vessel was known to have carried persons actually carried by the vessel appeared, it would prove very awkward for the captain. Then in the inspection of the vessel letters were opened, trunks and boxes ransacked, and all crosses, rosaries and objects of religion of any kind had to be thrown overboard. In 1635 Portuguese were forbidden to employ Japanese to carry their umbrellas or their shoes, and only their chief men were allowed to bear arms, while they had to hire fresh servants every year. It was in the following year (1636) that the artificial islet of Deshima was constructed for their special reception, or rather imprisonment. It lay in front of the former Portuguese factory, with which it was connected by a bridge, and henceforth the Portuguese were to crowd themselves there on their arrival and at their departure. Furthermore, all their cargoes had to be sold at a fixed price during their fifty days' stay to a ring of licensed merchants from the imperial towns."

The imposition of such irksome conditions did not deter the Portuguese, who continued to send merchandise-laden galleons to Nagasaki. But in 1638 the bolt fell. The Shimabara rebellion was directly responsible. Probably the fact of a revolt of Christian converts, in such numbers and fighting with such resolution, would alone have sufficed to induce the weak government in Yedo to get rid of the Portuguese altogether. But the Portuguese were suspected of having instigated the Shimabara insurrection, and the Japanese authorities believed that they had proof of the fact. Hence, in 1638, an edict was issued proclaiming that as, in defiance of the government's order, the Portuguese had continued to bring missionaries to Japan; as they had supplied these missionaries with provisions and necessary; and as they had fomented the Shimabara rebellion, therefore any Portuguese ship coming to Japan should be burned, together with her cargo, and every one on board of her should be executed. Ample time was allowed before enforcing this edict. Not only were the Portuguese ships then at Nagasaki permitted to close up their commercial transactions and leave the port, but also in the following year when two galleons arrived from Macao, they were merely sent away with a copy of the edict and a stern warning. But the Portuguese could not easily become reconciled to abandon a commerce from which they had derived splendid profits prior to the intrusion of the Spaniards, the Dutch and the English, and from which they might now hope further gains, since, although the Dutch continued to be formidable rivals, the Spaniards had been excluded, the English had withdrawn, and the Japanese, by the suicidal policy of their own rulers, were no longer able to send ships to China. Therefore they took a step which resulted in one of the saddest episodes of the Dutch story. For a long time, the most respected citizens of Macao, whose mission it was (1622) to lead back and remove the obstacles in the way of the trade, had been urging the government to permit a ship carrying no cargo but only rich presents. They bore a petition declaring that for a long time no missionaries had entered Japan from Macao, that the Portuguese had not been in any way connected with the Shimabara revolt, and that interruption of trade would injure Japan as much as Portugal.

These envoys arrived at Nagasaki on the 1st of July 1640, and 24 days sufficed to bring from Yedo, whither their petition had been sent, peremptory orders for their execution as well as executioners to carry out the orders. There was no possibility of resistance. The Japanese had removed the ship's rudder, sails, guns and ammunition, and had placed the envoys, their suite and the crews under guard in Deshima. On the 2nd of August they were all summoned to the governor's hall of audience, where, after their protest had been heard that ambassadors should be under the protection of international law, the sentence written in Yedo 13 days previously was read to them. The following morning the Portuguese were offered their lives if they would apostatize. Every one rejected the offer, and being then led out to the martyrs' mound, the heads of the envoys and of 57 of their companions fell. Thirteen were saved to carry the news to Macao. These thirteen, after witnessing the burning of the galleon, were conducted to the governor's residence who gave them this message:

"Do not fail to inform the inhabitants of Macao that the Japanese wish to receive from them neither gold nor silver, nor any kind of presents or merchandise; in a word, absolutely nothing which comes from foreign countries. Everything must be purchased with the clothes or the goods of the inhabitants of those who were executed yesterday to be burned. Let them do the same with respect to us if they find occasion to do so; we consent to it without difficulty. Let them think no more of us, just as if we were no longer in the world."

Finally the thirteen were taken to the martyrs' mound where, set up above the heads of the victims, a tablet recollected the story of the embassy and the reasons for the execution, and concluded with the words:

"So long as the sun warms the earth, let no Christian be so bold as to come to Japan, and let all know that if King Philip himself, or even the very God of the Christians, or the great Shaka contravenes this prohibition, they shall pay for it with their heads."

Had the ministers of the shōgun in Yedo desired to make clear to future ages that to Christianity alone was due the expulsion of Spaniards and Portuguese from Japan and her adoption of the policy of seclusion they could not have placed on record more conclusive testimony. Macao received the news with rejoicing in that its earthly ambassadors had been made ambassadors of heaven," but it did not abandon all hope of coming Japan's obduracy. When Portugal recovered her independence in 1640, the people of Macao requested Lisbon to send an ambassador to Japan, and on the 16th of July 1647 Don Gonzalo de Siqueira arrived in Nagasaki with two vessels. He carried a letter from King John IV., setting forth the severance of all connexion between Portugal and Spain, which countries were now actually at war, and urging that commercial relations should be re-established. The Portuguese, having refused to give up their rudders and arms, soon found themselves menaced by a force of fifty thousand samurai, and were glad to put out of port quietly on the 4th of September. This was the last episode in the medieval history of Portugal's intercourse with Japan.

When (1609) the Dutch contemplated forming a settlement in Japan, Ieyasu gave them a written promise that "no man should do them any wrong and that he would maintain and defend them as his own subjects." Moreover, the charter granted to them contained a clause providing that, into whatever ports their ships put, they were not to be molested or hindered in any way, but, "on the contrary, must be shown all manner of help, favour and assistance." They might then have chosen any port in Japan for their headquarters, but they had the misfortune to choose Hirado. For many years they had no cause to regret the choice. Their exclusive possession of the Spice Islands and their own enterprise and command of capital gave them the leading place in the trade. The Dutch, though they never achieved so rich a success as the English, or made so great a fortune as the Spaniards, were far more successful in augmenting their capital than the English, who, having changed greatly for the worse and when the English closed their books with a large loss, it is on record that the Dutch were reaping a profit of 76% annuually. Their doings at Hirado were not of a purely commercial character. The Anglo-Dutch "fleet of defence" made that port its basis of operations against the Spaniards and the Portuguese. It brought its prizes into Hirado, the profits to be equally divided between the fleet and the factories, Dutch and English, which arrangement involved a sum of a hundred thousand pounds in 1622. But after the death of Ieyasu there grew up at the Tokugawa court a party which advocated the expulsion of all foreigners on the ground that, though some professed a different form of Christianity from that of the Castilians and Portuguese, it was nevertheless one and the same creed. This policy was not definitely adopted,
but it made itself felt in a discourteous reception accorded to the commandant of Fort Zealandia when he visited Tokyō in 1627. He attempted to retaliate upon the Japanese vessels which put into Zealandia in the following year, but the Japanese managed to seize his person, exact reparations for loss of time and obtain five hostages whom they carried to prison in Japan. The Japanese government of that time was wholly intolerant of any injury done to its subjects by foreigners. When news of the Zealandia affair reached Yedo, orders were immediately issued for the sequestration of certain Dutch vessels and for the suspension of the Hirado factory, which veto was not removed for four years. Commercial arrangements, also, became less favourable. The Dutch, instead of selling their silk—which generally formed the principal staple of import—in the open market, were required to send it to the Osaka gild. No Japanese merchant, save Nagasaki, by whom means, Nagasaki and Osaka being Imperial cities, the Yedo government derived advantage from the transaction. An attempt to evade this onerous system provoked a very stern rebuke from Yedo, and shortly afterwards all Japanese subjects were forbidden to act as servants to the Dutch outside the latter's dwellings. The cooperation of the Hollanders in bombarding the castle of Hara during the Shimabara rebellion (1638) gave them some claim on the shōgun's government, but in the same year the Dutch received an imperious warning that the severest penalties would be inflicted if their ships carried priests or any religious objects or books. So profound was the dislike of everything relating to Christianity that the Dutch nearly caused the ruin of their factory. They were even instructed by intrusting on some newly erected warehouses the date according to the Christian era. The factory happened to be then presided over by Caron, a man of extraordinary penetration. Without a moment's hesitation he set 400 men to pull down the warehouses, thus depriving the Japanese of all pretext for recourse to violence. He was compelled, however, to promise that there should be no observance of the Sabbath hereafter and that time should no longer be reckoned by the Christian era. In a few months, further evidence of Yedo's ill will was furnished. An edict appeared ordering the Dutch to dispose of all their imports during the year of their arrival, without any option of carrying them away should prices be low. They were thus placed at the mercy of the Osaka gild. Further, they were forbidden to bring cattle or carry arms, and altogether it seemed as though the utmost was made to prevent the establishment of a factory.

An envoy despatched from Batavia to remonstrate could not obtain audience of the shōgun, and though he presented, by way of re sonostrance, the charter originally granted by Ieyasu, the reply he received was:

"His Majesty charges us to inform you that it is of but slight importance to the Empire of Japan whether foreigners come or do not come to trade. But in consideration of the charter granted to them by Ieyasu, he is pleased to allow the Hollanders to continue their operations, and to leave them their commercial and other privileges, on the condition that they evacuate Hirado and establish themselves with their vessels in the port of Nagasaki."

The Dutch did not at first regard this as a calamity. During their residence of 31 years at Hirado they had enjoyed full freedom, had been on excellent terms with the feudatory and his subjects, and had prospered in their business. But the discovery of the place and the inconvenience of the anchorage having always been recognized, transfer to Nagasaki promised a splendid harbour and much larger custom. Bitter, therefore, was their disappointment when they found that they were to be imprisoned in Deshima, a quadrangular island whose longest face did not measure 300 yds., and that, so far from living in the town of Nagasaki, they would not be allowed even to enter it. Siebold writes:

"A guard at the gate prevented all communications with the city of Nagasaki; no Dutchman without weighty reasons and without the permission of the governor might pass the gate; no Japanese (unless public women) might live in a Dutchman's house. As if this were not enough, even within Deshima itself our state prisoners were keenly watched. No Japanese might speak with them in their own language unless in the presence of a witness (a government spy) or visit them in their houses. The creatures of the governor had the warehouses under key and the Dutch traders ceased to be masters of their property."

There were worse indignities to be endured. No Dutchman might be buried in Japanese soil: the dead had to be committed to the deep. Every Dutch ship, her rudder, guns and ammunition removed and her sails sealed, was subjected to the strictest search. No religious service could be held. No one was suffered to pass from one Dutch ship to another without the governor's permit. Sometimes the officers and men were wantonly cudgelled by petty Japanese officials. They led, in short, a life of extreme abasement. Some relaxation of this extreme severity was afterwards obtained, but at no time of their sojourn in Deshima, a period of 217 years, were the Dutch relieved from irksome and humiliating restraints. Eleven years after their removal thither, the expediency of consulting the national honour by finally abandoning an enterprise so derogatory was gravely discussed, but hopes of improvement supplementing natural reluctance to surrender a monopoly which still brought large gains, induced them to persevere. At that time this Nagasaki over-sea trade was considerable. From 7 to 10 Dutch ships used to enter the port annually, carrying cargo valued at some 80,000 lb of silver, the chief staples of import being silk and piece-goods, and the government levying 5% by way of customs dues. But this did not represent the whole of the charges imposed. A rent of 459 lb of silver had to be paid each year for the little island of Deshima and the houses standing on it; and, further, every spring, the Hollanders were required to send to Yedo a mission bearing for the shōgun, the heir-apparent and the court officials representing an aggregate value of about 550 lb of silver. They found their account, nevertheless, in buying gold and copper—especially the latter—for exportation, until the Japanese authorities, becoming alarmed at the great quantity of copper thus carried away, adopted the policy of limiting the number of vessels, as well as the amount of copper shipped from the former inward and outward cargoes, so that, in 1639, only one ship might enter annually, nor could she carry away more than 350 tons of copper. On the other hand, the formal visits of the captain of the factory to Yedo were reduced to one every fifth year, and the value of the presents carried by him was cut down to one half.

Well-informed historians have contended that, by thus segregating herself from contact with the West, Japan's direct losses were small. Certainly it is true that she could not have learned much from European nations in the 17th century. They had little to teach her in the way of religious tolerance; in the way of international morality; in the way of social amenities and etiquette; in the way of artistic conception and execution; or in the way of that notable shibboleth of modern civilization, the open door and equal opportunities. Yet when all this is admitted, there remains the vital fact that Japan was thus shut off from the atmosphere of competition, and that for nearly two centuries and a half she never had an opportunity of warping her intelligence at the fire of international rivalry or deriving inspiration from an exchange of ideas. She stood comparatively still while the world went on, and the interval between her and the leading peoples of the Occident in matters of material civilization had become very wide before she awoke to a sense of its existence. The sequel of this page of her history has been faithfully summarized by a modern writer:

"A more complete metamorphosis of a nation's policy could scarcely be conceived. We were, indeed, discriminated, or notorious, throughout the whole of the Far East for exploits abroad; we find them known as the 'kings of the sea'; we find them welcoming foreigners with cordiality and opposing no obstacles to foreign commerce of foreign even to the propaganda of foreign goods find them so quick to recognize the benefits of foreign trade and so apt to pursue them that, in the space of a few years, they establish commercial relations with no less than twenty over-sea markets; we find them more noble in these respects than the English, permitted to trade at every port in the empire; we find, in short, all the elements requisite for a career of commercial enterprise, ocean-going adventure and industrial liberality. In 1641 everything is reversed. Trade is interdicted to all Western peoples except the Dutch, and
they are confined to a little island 200 yards in length by 80 in width; the least symptom of predilection for any alien creed exposes a Japanese subject to be punished with awful rigour; any attempt to leave the limits of the realm involves deprivation; not a ship large enough to convey the whole of the treasure now in common use, as zaikaika, seiyō-jin, or ts-jin, which embody the simple meanings 'foreigner,' 'Westerner' or 'alien'; they were popularly called baleren (padres). Thus completely had foreign intercourse and Christian propaganda become identified with the terms in which they were spoken and had it been considered that foreign intercourse, associated with Christianity, had come to be synonymous in Japanese ears with foreign aggression, with the subservial of the mikado's ancient dynasty, and with the loss of the independence of that country of the gods, there is no difficulty in understanding the attitude of the nation's mind towards this question."

Foreign Intercourse in Modern Times.—From the middle of the 17th century to the beginning of the 19th, Japan succeeded in rigorously enforcing her policy of seclusion. But in the concluding days of this epoch two influences began to disturb her self-sufficiency. One was the gradual infiltration of light from the outer world through the narrow window of the Dutch port at Deshima; the other, frequent apparitions of Dutch vessels on her northern coasts. The former was a slow process. It materialized first in the study of anatomy by a little group of youths who had acquired accidental knowledge of the radical difference between Dutch and Japanese conceptions as to the structure of the human body. The work of these students reads like a page of romance. Without any appreciable knowledge of the Dutch language, they set themselves to decipher a Dutch medical book, obtained at enormous cost from a few Dutch merchants who passed to a vague but firm conviction that their country had fallen far behind the material and intellectual progress of the Occident. They laboured in secret, for the study of foreign books was then a criminal offence; yet the patriotism of one of their number out weighed his prudence, and he boldly published a brochure advocating the construction of a navy and predicting a descent by the Russians on the northern borders of the empire. Before this prescient man had lain five months in prison, his foresight was verified by events. The Russians simulated at the outset a desire to establish commercial relations by peaceful means. Had the Japanese been better acquainted with the history of nations, they would have known how to interpret the idea of a Russian quest for commercial connexions in the Far East a hundred years ago. But they dealt with the question on its superficial merits, and, after imposing on the tsar's envoy's a water-craft for several months at Nagasaki, addressed to them a peremptory refusal together with an order to leave that port forthwith. Incensed by such treatment, and by the subsequent imprisonment of a number of their fellow countrymen who had landed on the island of Etorofu in the Kuriles, the Russians resorted to armed reprisals. The Japanese settlements in Sakhalin and Etorofu were raided and burned, other places were menaced and several Japanese vessels were destroyed. The lesson sank deep into the minds of the Yedo officials. They withdrew their veto against the study of foreign books, and they arrived in part at the reluctant conclusion that to offer armed opposition to the coming of foreign ships was a task somewhat beyond Japan's capacity. Japan ceased, however, to attract European attention amid the absorbing interest of the Napoleonic era, and the shōgun's government, misinterpreting this respite, reverted to their old policy of stalwart resistance to foreign intercourse.

Meanwhile another power was beginning to establish close contact with Japan. The whaling industry in Russian waters off the coast of Alaska and in the seas of China and Japan had attracted large investments of American capital and was pursued yearly by thousands of American citizens. In one season 86 of these whaling vessels passed within easy sight of Japan's northern island, Yezo, so that the aspect of foreign ships became quite familiar. From time to time American schooners were cast away on Japan's shores. Generally the survivors were treated with tolerable consideration and ultimately sent to Deshima for shipment to Batavia. Japanese sailors, too, driven out of their route by hurricanes and caught in the stream of the "Black Current," were occasionally carried to the Aleutian Islands, to Oregon or California, and in several instances these shipwrecked mariners were taken back to Japan with all kindness by American vessels. On such an errand of mercy the "Morrison" entered Yedo Bay in 1837, proceeding thence to Kagoshima, only to be driven away by cannon shot; and on such an errand the "Manhattan" in 1845 lay for four days at Uraga while her master (Mercat Cooper) collected books and charts. It would seem that his experience induced the Washington government to attempt the opening of Japan. A ninety-gun ship and a sloop were sent on the errand. They anchored off Uraga (July 1846) and Commodore Biddle made due application for trade. But he received a positive refusal, and having been instructed by his government to abstain from any act calculated to excite hostility or distrust, he quietly weighed anchor and sailed away.

In this same year (1846) a French ship touched at the Riuki (Luchu) archipelago and sought to persuade the islanders that their only security against British aggression was to place themselves under the protection of France. In fact Great Britain was now beginning to interest herself in south China, and more than one warning reached Yedo from Deshima that English war-ships might at any moment visit Japanese waters. The Dutch have been much blamed for thus attempting to prejudice Japan against the Occident, but if the dictates of commercial rivalry, as it was then practised, do not constitute a simple explanation, it should be remembered that England and Holland had recently been enemies, and that the last Dutch vessel, seen at Nagasaki, had gone there hoping to capture the annual Dutch trading-ship from Batavia. Deshima's warnings, however, remained unfulfilled, though they doubtless contributed to Japan's feeling of uneasiness. Then, in 1847, the king of Holland himself intervened. He sent to Yedo various books, together with a map of the world and a despatch advising Japan to abandon her policy of isolation. Within a few months (1849) of the receipt of his Dutch majesty's recommendation, an American brig, the "Preble," under Commander J. Glynn, anchored in Nagasaki harbour and threatened to bombard the town unless immediate delivery were made of 18 seamen who, having been wrecked in northern waters, were held by the Japanese preparatory to shipment for Batavia. In 1849 another despatch arrived, and the king of Holland announced that an American fleet might be expected in Japanese waters a year later, and that, unless Japan agreed to enter into friendly commercial relations, war must ensue. Appended to this despatch was an approximate draft of the treaty which would be presented for signature, together with a copy of a memorandum addressed by the Washington government to European nations, justifying the contemplated expedition on the ground that it would inure to the advantage of Japan as well as to that of the Occident.

In 1853, Commodore Perry, with a squadron of four ships of war and 560 men, entered Uraga Bay. So formidable a foreign force had not been seen in Japanese waters since the coming of the Mongol Armada. A panic ensued among the people—the same people who, in the days of Hideyoshi or Ieyasu, were held to have assumed a confidence of victory. The contrast did not stop there. The shōgun, whose ancestors had administered the country's affairs with absolutely autocratic authority, now summoned a council of the feudalatories to consider the situation; and the Imperial court in Kioto, which never appealed for heaven's aid except in a national emergency such as had never been witnessed since the creation of the shōgunate, now directed that at the seven principal shrines and at all the great temples special "H.M.S. "Phaeton," which entered that port in 1808.
prayers should be offered for the safety of the land and for the destruction of the aliens. Thus the appearance of the American squadron awoke in the cause of the country as a whole a spirit of patriotism hitherto confined to feudal interests. The shōgun does not seem to have had any thought of invoking that spirit; his part in raising it was involuntary and his ministers behaved with perplexed vacillation. The infirmity of the Yedo Administration's purpose presented such a strong contrast to the single-minded resolution of the Imperial court that the prestige of the one was largely impaired and that of the other correspondingly enhanced. Perry, however, was without authority to support his proposals by any recourse to violence. The United States government had relied solely on the moral effect of his display of force, and his countrypeople had supplied him with a large collection of the products of peaceful progress, from sewing machines to miniature railways. He did not unduly press for a treaty, but after lying at anchor off Uraga during a period of ten days and after transmitting the president's letter to the sovereign of Japan, he steamed away on the 17th of July, announcing his return in the ensuing spring. The conduct of the Japanese subsequently to this departure showed how fully and rationally they had acquired the conviction that the appliances of their old civilization were powerless to resist the resources of the new. Orders were issued rescinding the long-enforced veto against the construction of sea-going ships; the feudal chiefs were invited to build and arm large vessels; the Dutch were commissioned to furnish a ship of war and to procure from Europe all the best works on modern military science; every one who had acquired any expert knowledge through the medium of Deshima was taken into official favour; forts were built; cannon were cast and troops were drilled. But from all this effort there resulted only fresh evidence of the country's inability to defy foreign insistence, and on the 2nd of December 1853, instructions were issued that if the Americans returned, they were to be dealt with peacefully. The sight of Perry's steam-propelled ships, their powerful guns and all the specimens they carried of western wonders, had practically broken down the barriers of Japan's isolation without any need of treaties or conventions. Perry returned in the following February, and after an interchange of courtesies and formalities extending over six weeks, obtained a treaty pledging Japan to accord kind treatment to shipwrecked sailors; to permit foreign vessels to obtain stores and provisions within her territory, and to allow American ships to anchor in the ports at Shimoda and Hakodate. On this second occasion Perry had 10 ships with crews numbering two thousand, and when he landed to sign the treaty, he was escorted by a guard of honour mustering 500 strong in 27 boats. Much has been written about his judicious display of force and his sagacious tact in dealing with the Japanese, but it may be doubted whether the consequences of his exploit have not invested its methods with extravagant lustre. Standing on the threshold of modern Japan's wonderful career, his figure shines by the reflected light of its surroundings.

Russia, Holland and England speedily secured for themselves treaties similar to that concluded by Commodore Perry in 1854. But Japan's doors still remained closed to foreign commerce, and it was reserved for another citizen of the great republic to open them. This was Townsend Harris (1803-1878), the first U.S. consul-general in Japan.

Arriving in August 1856, he concluded, in June of the following year, a treaty securing to American citizens the privilege of permanent residence at Shimoda and Hakodate, the opening of Nagasaki, the right of consular jurisdiction and certain minor concessions. Still, however, permission for commercial intercourse was withheld, and Harris, convinced that this great goal could not be reached unless he made his way to Yedo and conferred direct with the shōgun's ministers, pressed persistently for leave to do so. Ten months elapsed before he succeeded, and such a display of reluctance on the Japanese side was very unfavourably criticised in the years immediately subsequent. Ignorance of the country's domestic politics inspired the critics. The Yedo administration, already weakened by the growth of a strong public sentiment in favour of abolishing the dual system of government—that of the mikado in Kiōto and that of the shōgun in Yedo—had been still further discredited by its own timid policy as compared with the stalwart men of the throne towards the question of foreign intercourse. Openly to sanction commercial relations at such a time would have been little short of reckless. The Perry convention and the first Harris convention could be construed, and were purposely construed, as mere acts of benevolence towards strangers; but a commercial treaty would not have lent itself to any such construction, and naturally the shōgun's ministers hesitated to agree to an apparently suicidal step. Harris carried his point, however. He was received by the shōgun in Yedo in November 1857, and on the 20th of July 1858 a treaty was signed in Yedo, engaging that Yokohama should be opened on the 4th of July 1859 and that commerce between the United States and Japan should thereafter be freely carried on there. This treaty was actually concluded by the shōgun's Ministers in defiance of their failure to obtain the sanction of the sovereign in Kiōto. Foreign historians have found much to say about Japanese duplicity in concealing the subordinate position occupied by the Yedo government towards the Kiōto court. Such a conclusion is not consistent with fuller knowledge. The Yedo authorities had power to solve all problems of foreign intercourse without reference to Kiōto. Iyemitsu had not seen any occasion to seek imperial assent when he granted unrestricted liberty of trade to the representatives of the East India Company, nor had Iyemitsu asked for Kiōto's sanction when he issued his decree for the expulsion of all foreigners. If, in the 19th century, Yedo shrank from a responsibility which it had unhesitatingly assumed in the 17th, the cause was to be found, not in the shōgun's simulation of autonomy, but in his desire to associate the throne with a policy which, while recognizing it to be unavoidable, he distrusted his own ability to make the nation accept. But his ministers had promised Harris that the treaty should be signed, and they kept their word, at a risk of which the United States' consul-general had no conception. Throughout these negotiations Harris spared no pains to create in the minds of the Japanese an intelligent conviction that the world could no longer be kept at arm's length, and that the only problematical whether he would have succeeded had not the Japanese themselves already arrived at that very conviction, his patient and lucid expositions coupled with a winning personality undoubtedly produced much impression. He was largely assisted, too, by recent events in China, where the Peiho forts had been captured and the Chinese forced to sign a treaty at Tientsin. Harris warned the Japanese that the British fleet might be expected at any moment in Yedo Bay, and that the best way to avert irksome demands at the hands of the English was to establish a comparatively moderate precedent by Yielding to America's proposals.

This treaty could not be represented, as previous conventions had been, in the light of a purely benevolent concession. It definitely provided for the trade and residence of foreign merchants, and thus finally terminated Japan's traditional isolation. Moreover, it had been concluded in defiance of the throne's refusal to sanction anything of the kind. Much excitement resulted. The nation ranged itself into three parties. One comprised the advocates of free intercourse and progressive liberality; another, while insisting that only the most limited privileges should be accorded to aliens, was of two minds as to the advisability of offering armed resistance at once or temporizing so as to gain time for preparation; the third advocated uncompromising seclusion. Once again the shōgun convoked a meeting of the feudal barons, hoping to secure their co-operation. But with hardly an exception they pronounced against yielding. Thus the shōgun saw itself compelled to adopt a resolutely liberal policy: it issued a decree in that sense, and thenceforth the administrative court at Yedo and the Imperial court in Kiōto stood in unequivocal opposition to each other, the Conservatives ranging themselves on the side of the latter, the Liberals on that of the former. It was a situation full of perplexity to outsiders, and the foreign
representatives misinterpreted it. They imagined that the shōgun's ministers sought only to evade their treaty obligations and to render the situation intolerable for foreign residents, whereas in truth the situation threatened to become intolerable for the shōgunate itself. Nevertheless the Yedo officials cannot be entirely acquitted of duplicity. Under pressure of the necessity of self-preservation they effectuated with Kōtoku a compromise which assigned to foreign intercourse a temporary character. The threatened political crisis was thus averted, but the enemies of the dual system of government gained strength daily. One of their devices was to assassinate foreigners in the hope of embroiling the shōgunate with Western powers and thus either forcing its hand or precipitating its downfall. It is not wonderful, perhaps, that foreigners were deceived, especially as they approached the solution of Japanese problems with all the Occidental's habitual suspicion of everything Oriental. Thus when the Yedo government, cognizant that serious dangers menaced the Yokohama settlement, took precautions to guard it, the foreign ministers convinced themselves that a deliberate piece of chicanery was being practised at their expense; that statecraft rather than truth had dictated the representations made to them by the Japanese authorities; and that the alarm of the latter was simulated for the purpose of finding a pretext to curtail the liberty enjoyed by foreigners. Therefore a suggestion that the inmates of the legations should show themselves as little as possible in the streets of the capital, where at any moment a desperado might cut them down, was treated almost as an insult. Then the Japanese authorities saw no recourse except to attach an armed escort to the person of every foreigner when he moved about the city. But even this precaution, which certainly was not adopted out of mere caprice or with any sinister design, excited fresh suspicions. The British representative, in reporting the event to his government, said that the Japanese had taken the course of suddenly sending a body of spies, watchmen and police-officers at the several legations, a mounted escort to accompany the members whenever they moved about.

Just at this time (1861) the Yedo statesmen, in order to reconcile the divergent views of the two courts, negotiated a marriage between the emperor's sister and the shōgun. But in order to bring the union about, they had to placate the Kōtoku Conservatives by a promise to expel foreigners from the country within ten years. When this became known, it strengthened the hands of the reactionaries, and furnished a new weapon to Yedo's enemies, who interpreted the marriage as the beginning of a plot to dethrone the mikado. Murderous attacks upon foreigners became more frequent. Two of these assaults had momentous consequences. Three British subjects attempted to force their way through the cortège of the Satsuma feudal chief on the highway between Yokohama and Yedo. One of them was killed and the other two wounded. This outrage was not inspired by the "barbarian expelling" sentiment: to any Japanese subject violating the rules of etiquette as these Englishmen had violated them, the same fate would have been meted out. Nevertheless, as the Satsuma daimyō refused to surrender his implicated vassals, and as the shōgun's arm was not long enough to reach the most powerful feudatory in Japan, the British government sent a squadron to bombard his capital, Kagoshima. It was not a brilliant exploit in any sense, but its results were invaluable; for the operations of the British ships finally convinced the Satsuma men of their impotence in the face of Western armaments, and converted them into advocates of liberal progress. Three months previously to this bombardment of Kagoshima another puissant feudatory had thrown down the gauntlet. The Chōshū chief, whose batteries commanded the entrance to the Ōiso port, felt himself the easy victim of fire upon ships flying the flags of the United States, of France, and of Holland. In thus acting he obeyed an edict obtained by the extremists from the mikado without the knowledge of the shōgun, which edict fixed the 11th of May 1863 as the date for practically inaugurating the foreigners-expulsion policy.

Again the shōgun's administrative competence proved inadequate to exact reparation, and a squadron, composed chiefly of British men-of-war, proceeding to Shimonoseki, demolished Chōshū's forts, destroyed his ships and scattered his samurai. In the face of the Kagoshima bombardment and the Shimonoseki expedition, no Japanese subject could retain any faith in his country's ability to oppose Occidentals by force. Thus the year 1865 was memorable in Japan's history. It saw the "barbarian-expelling" agitation deprived of the emperor's sanction; it saw the two principal clans, Satsuma and Chōshū, convinced of their country's impotence to defy the Occident; it saw the nation almost fully roused to the disintegrating and weakening effects of the feudal system; and it saw the traditional antipathy to foreigners beginning to be exchanged for a desire to study their civilization and to adopt its best features.

The treaty concluded between the shōgun's government and the United States in 1856 was of course followed by similar contracts with the principal European powers. Ratification of the treaties was the assertion of their conventional privileges, and they naturally took Great Britain for leader, though such a relation was never openly announced. The treaties, however, continued during several years to lack imperial ratification, and, as time went by, that defect obstructed itself more and more upon the attention of their foreign signatories. The year 1865 saw British interests entrusted to the charge of Sir Harry Parkes, a man of keen insight, indomitable courage and somewhat peremptory methods, learned during a long period of service in China. It happened that the post of Japanese secretary at the British legation in Yedo was then held by a remarkably gifted young Englishman, who, in a comparatively brief interval, had acquired a good working knowledge of the Japanese language, and it happened also that the British legation in Yedo was held by a man of the best equipped institution of its class in Japan. Aided by these facilities and by the researches of Mr Satow (afterwards Sir Ernest Satow) Parkes arrived at the conclusions that the Yedo government was tottering to its fall; that the resumption of administrative authority by the Kōtoku court would make for the interests not only of the West but also of Japan; and that the ratification of the treaties by the mikado would elucidate the situation for foreigners while being, at the same time, essential to the validity of the documents. Two other objects also presented themselves, namely, that the import duties fixed by the conventions should be reduced from 15 to 5% ad valorem, and that the ports of Hōgō and Osaka should be opened at once, instead of at the expiration of two years as originally fixed. It was not proposed that these concessions should be entirely gratuitous. When the four-power flotilla destroyed the Shimonoiseki batteries and sank the vessels lying there, a fine of three million dollars (some £75,000) had been imposed upon the daimyō of Chōshū by way of ransom for his capital, which lay at the mercy of the invaders. The daimyō of Chōshū, however, was in open rebellion against the shōgun, and as the latter could not collect the debt from the recalcitrant clansmen, while the four powers insisted on being paid by some one, the Yedo treasury was finally compelled to shoulder the obligation. Two out of the three millions were still due, and Parkes conceived the idea of remitting this debt in exchange for the ratification of the treaties, the reduction of the customs tariff from 15 to 5% ad valorem and the immediate opening of Hōgō and Osaka. He took with him to the place of negotiation (Hōgō) a fleet of British, French and Dutch war-ships, for, while announcing peaceful intentions, he had accustomed himself to think that a display of force should occupy the foreground in all negotiations with Oriental states. This coup d'œil was such that he at once brought all the other powers into line, and for here again was produced in a highly aggravated form the drama which had so greatly startled the nation eight years previously. Perry had come with his war-ships to the portals of Yedo, and now a foreign fleet, twice as strong as Perry's, had anchored at the vestibule of the Imperial city itself. No rational Japanese
could suppose that this parade of force was for purely peaceful purposes, or that rejection of the amicable bargain proposed by Great Britain's representative would be followed by the quiet withdrawal of the menacing fleet, whose terrible potentialities had been demonstrated at Kagoshima and Shimonoseki. The seclusionists, whose voices had been nearly silenced, raised them in renewed denunciation of the shōgun's incompetence to guarantee the sacred city of Kiōto against such trespasses, and the emperor, brought once more under the influence of the anti-foreign party, inflicted a heavy disgrace on the shōgun by dismissing and punishing the officials to whom the latter had entrusted the conduct of negotiations at Hiōgō. Such procedure on the part of the throne amounted to withdrawing the administrative commission held by the Tokugawa family since the days of Ieyasu. The shōgun resigned. But his adversaries not being yet ready to replace him, he was induced to resume office, with, however, fatally damaged prestige. As for the three-power squabble, it steamed away successful.

The shōgun did not long survive the humiliation thus inflicted on him. He died in the following year (1866), and was succeeded by Keiki, destined to be the last of the Tokugawa rulers. Nine years previously this same Keiki had been put forward by the seclusionists as candidate for the shōgunate. Yet no sooner did he attain that distinction in 1866 than he remodelled the army on French lines, engaged English officers to organize a navy, sent his brother to the Paris Exhibition, and altered many of the forms and ceremonies of his court so as to bring them into accord with Occidental fashions. The contrast between the politics he represented when a candidate for office in 1857 and the practice he adopted on succeeding to power in 1866 furnished an example of the change that did come over the spirit of the time. The most bigoted of the seclusionists were now beginning to abandon all idea of expelling foreigners and to think mainly of acquiring the best elements of their civilization. The Japanese are slow to reach a decision but very quick to act upon it when reached. From 1866 onwards the new spirit rapidly permeated the whole nation; progress became the aim of all classes, and the country entered upon a career of intelligent assimilation which, in forty years, won for Japan a universally accorded place in the ranks of the great Occidental powers.

After the abolition of the shōgunate and the resumption of administrative functions by the Throne, one of the first acts of the newly organized government was to invite the foreign representatives to Kiōto, where they had audience of the mikado. Subsequently a decision was announced by the emperor's mandate to resolve to establish amicable relations with foreign countries, and “declaring that any Japanese subject thereafter guilty of violent behaviour towards a foreigner would not only act in opposition to the Imperial command, but would also be guilty of impairing the dignity and good faith of the nation in the eyes of the powers with which his majesty had pledged himself to maintain friendship.” From that time the relations between Japan and foreign states grew yearly more amicable; the nation adopted the products of Western civilization with notable thoroughness, and the provisions of the treaties were carefully observed. Those treaties, however, presented one feature which very soon became exceedingly irksome to Japan. They exempted foreigners residing within her borders from the operation of her criminal laws, and secured to them the privilege of being arraigned solely before tribunals of their own nationality. That system had always been considered necessary where the subjects of Christian states visited or sojourned in non-Christian countries, and, for the purpose of giving effect to it, consular courts were established. This necessitated the confinement of foreign residents to settlements in the neighbourhood of the consular courts, since it would have been imprudent to allow foreigners to have free access to districts remote from the only tribunals competent to control them. The Japanese raised no objection to the embodiment of this system in the treaties. They recognized its necessity and even its expediency, for if, on the one hand, it infringed their country's sovereign rights, on the other, it prevented complications which must have ensued had they been entrusted with jurisdiction which they were not prepared to discharge satisfactorily. But the consular courts were not free from defects. A few of the powers organized competent tribunals presided over by judicial experts, but a majority of the treaty states, not having sufficiently large interests at stake, were content to delegate consular duties to merchants, not only deficient in legal training, but also themselves engaged in the very commercial transactions upon which they might at any moment be required to adjudicate in a magisterial capacity. In any circumstances the dual functions of consul and judge could not be discharged without anomaly by the same officials, for he was obliged to act as advocate in the preliminary stages of complications about which, in his position as judge, he might ultimately have to deliver an impartial verdict. In practice, however, the system worked with tolerable smoothness, and might have remained long in force had not the patriotism of the Japanese rebelled bitterly against the implication that their country was unfit to exercise one of the fundamental attributes of every sovereign state, judicial autonomy. From the very outset they spared no effort to qualify for the recovery of this attribute. Revision of the country's laws and re-organization of its law courts would necessarily have been an essential feature of the general reforms suggested by contact with the Occident, but the question of consular jurisdiction certainly constituted a special incentive. Expert assistance was obtained from France and Germany; the best features of European jurisprudence were adapted to the conditions and usages of Japan; the law courts were remodelled, and steps were taken to educate a competent judiciary. In criminal law the example of France was chiefly followed; in commercial law that of Germany; and in civil law that of the Occident generally, with due regard to the customs of the country. The jury system was not adopted, collegiate courts being regarded as more conducive to justice, and the order of procedure went from tribunals of first instance to appeal courts and finally to the court of cassation. Schools of law were quickly opened, and a well-equipped bar soon came into existence. Twelve years after the inception of these great works, Japan made formal application for revision of the treaties on the basis of abolishing consular jurisdiction. She had asked for revision in 1871, sending to Europe and America an important embassy to raise the question. But at that time the conditions originally calling for consular jurisdiction had not undergone any change such as would have justified its abolition, and the Japanese government, though very anxious to recover tariff as well as judicial, shrank from separating the two questions, lest by prematurely solving one the solution of the other might be unduly deferred. Thus the embassy failed, and though the problem attracted great academical interest from the first, it did not re-enter the field of practical politics until 1883. The negotiations were long protracted. Never previously had an Oriental state received at the hands of the Occident recognition such as that now demanded by Japan, and the West naturally felt deep reluctance to try a wholly novel experiment. The United States had set a generous example by concluding a new treaty (1878) on the lines desired by Japan. But its operation was conditional on a similar act of compliance by the other treaty powers. Ill-informed European publicists ridiculed the Washington statesmen's attitude on this occasion, claiming that what had been given with one hand was taken back with the other. The truth is that the conditional provision was inserted at the request of Japan herself, who appreciated her own unpreparedness for the concession. From 1883, however, she was ready to accept full responsibility, and she therefore asked that all foreigners within her borders should thenceforth be subject to her laws and judiciable by her law-courts, supplementing her...
application by promising that its favourable reception should be followed by the complete opening of the country and the removal of all restrictions hitherto imposed on foreign trade, travel and residence in her realm. From the first it had been the habit of Occidental peoples to upbraid Japan on account of the barriers opposed by her to full and free foreign intercourse, and she was now able to claim that these barriers were no longer maintained by her desire, but that they existed because of a system which theoretically proclaimed her unfitness for free association with Western nations, and practically made it impossible for her to throw open her territories completely for the ingress of foreigners. She had a strong case, but on the side of the European powers extreme reluctance was manifest to try the unprecedented experiment of placing their people under the jurisdiction of an Oriental country. Still greater was the reluctance of those upon whom the experiment would be tried. Foreigners residing in Japan naturally clung to consular jurisdiction as a privilege of inestimable value. They saw, indeed, that such a system could not be permanently imposed on a country where the conditions justifying it had nominally disappeared. But they saw, also, that the legal and judicial reforms effected by Japan had been crowded into an extraordinarily brief period, and that, as tyros experimenting with alien systems, the Japanese might be betrayed into many errors.

The negotiations lasted for eleven years. They were begun in 1883 and a solution was not reached until 1894. Finally European Recognition by the Powers governments conceded the justice of Japan's case, and it was agreed that from July 1899 Japanese tribunals should assume jurisdiction over every person of whatever nationality, within the confines of Japan, and the whole country should be thrown open to foreigners, all limitations upon trade, travel and residence being removed. Great Britain took the lead in thus releasing Japan from the fetters of the old system. The initiative came from her with special grace, for the system and all its irksome consequences had been originally imposed on Japan by a combination of powers with Great Britain in the van. As a matter of historical sequence the United States dictated the terms of the first treaty providing for consular jurisdiction. But from a very early period the Washington government showed its willingness to remove all limitations of Japan's sovereignty, whereas Europe, headed by Great Britain, whose preponderating interests entitled her to lead, resolutely refused to make any substantial concession. In Japanese eyes, therefore, British conservatism seemed to be the one serious obstacle, and since the British residents in the settlements far outnumbered all other nationalities, and since they alone had newspaper organs to ventilate their grievances—it was certainly fortunate for the popularity of her people in the Far East that Great Britain saw her way finally to set a liberal example. Nearly five years were required to bring the other Occidental powers into line with Great Britain and America. It should be stated, however, that neither reluctance to make the necessary concessions nor want of sympathy with Japan caused the delay. The explanation is, first, that each set of negotiators sought to improve either the terms or the terminology of the treaties already concluded, and, secondly, that the tariff arrangements for the different countries required elaborate discussion.

Until the last of the revised treaties was ratified, voices of protest against revision continued to be vehemently raised by a large section of the foreign community in the settle- ment, who were sensible that the issue of the experiment. Others were swayed by racial prejudice. A few had fallen into an insuperable habit of grumbling, or found their account in advocating conservatism under pretence of championing foreign interests; and all were naturally reluctant to forfeit the immunity from taxation hitherto enjoyed. It seemed as though the inauguration of the new system would find the foreign community in a mood which must greatly diminish the chances of a happy result, for where a capious and aggrieved disposition exists, opportunities to discover causes of complaint cannot be wanting. But at the eleventh hour this unfavourable demeanour underwent a marked change. So soon as it became evident that the old system was hopelessly doomed, the sound common sense of the European and American business man asserted itself. The foreign residents let it be seen that they intended to bow cheerfully to the inevitable, and that no obstacles would be willingly placed by them in the path of Japanese juris- diction. The Japanese, on their side, took some promising steps. An Imperial rescript declared in unequivocal terms that it was the sovereign's policy and desire to abolish all distinctions between natives and foreigners, and that by fully carrying out the friendly purpose of the treaties his people would best consult his wishes, maintain the character of the nation, and promote its prestige. The premier and other ministers of state issued instructions to the effect that the responsibility now devolved on the government, and the duty on the people, of enabling foreigners to reside confidently and contentedly in every part of the country. Even the chief Buddhist prelates addressed to the priests and parishioners in their diocesan injunctions pointing out that, freedom of conscience being now guaranteed by the constitution, men professing alien creeds must be treated as courteously as the followers of Buddhism, and must enjoy the same rights and privileges.

Thus the great change was effected in circumstances of happy augury. Its results were successful on the whole. Foreigners residing in Japan now enjoy immunity of domicile, personal and religious liberty, freedom from official interference, and security of life and property as fully as though they were living in their own countries, and they have gradually learned to look with greatly increased respect upon Japanese law and its administrators.

Next to the revision of the treaties and to the result of the great wars waged by Japan since the resumption of foreign intercourse, the most memorable incident in her modern history was the conclusion, first, of an entente, and, secondly, of an offensive and defensive alliance with Great Britain in January 1902 and September 1905, respectively. The entente set out by disavowing on the part of each of the contracting parties any aggressive tendency in either China or Korea, the independence of which two countries was explicitly recognized; and went on to declare that Great Britain in China and Japan in Korea might take indispensable measures to safeguard their interests; while, if such measures involved one of the signatories in war with a third power, the other signatory would not only remain neutral but would also undertake to prevent other powers from joining in hostilities against its ally, and would come to the assistance of the latter in the event of its being faced by two or more powers. The entente further recognized that Japan possessed, in a peculiar degree, political, commercial and industrial interests in Korea. This agreement, equally novel for each of the contracting parties, evidently tended to the benefit of Japan more than to that of Great Britain, inasmuch as the interests in question were vital from the former power's point of view but merely local from the latter's. The inequality was corrected by an offensive and defensive alliance in 1905. For the scope of the agreement was then extended to India and eastern Asia generally, and while the signatories pledged themselves, on the one hand, to preserve the common interests of all powers in China by insuring her integrity and independence as well as the principle of equal opportunities for the commerce and industry of all nations within her borders, they also agreed, on the other hand, to come to the assistance of the latter in the event of those rights being assailed by any other power or powers. These agreements have, of course, a close relation to the events which accompanied or immediately preceded them, but they also present a vivid and radical contrast between a country which, less than half a century previously, had struggled vehemently to remain secluded from the world, and a country which now allied itself with one of the most liberal and progressive nations for the purposes of a policy
extending over the whole of eastern Asia and India. This contrast was accentuated two years later (1907) when France and Russia concluded entente with Japan, recognizing the independence and integrity of the Chinese Empire, as well as the principle of equal opportunity for all nations in that country, and engaging to support each other for assuring peace and security there. Japan thus became a world power in the most unequivocal sense.

Japan's Foreign Wars and Complications.—The earliest foreign war conducted by Japan is said to have taken place at the beginning of the 3rd century, when the empress Jingu led an army to the conquest of Korea. But as the event is supposed to have happened more than 300 years before the first Japanese record was written, its traditional details cannot be seriously discussed. There is, however, no room to doubt that from time to time in early ages Japanese troops were seen in Korea, though they made no permanent impression on the country. It was reserved for Hideyoshi, the taiko, to make the Korean peninsula the scene of a great over-sea campaign. Hideyoshi, the Napoleon of Japan, having brought the whole empire under his sway as the sequel of many years of incomparable generality and statecraft, conceived the project of subjugating China. By some historians his motive has been described as a desire to find employment for the immense mob of armed men whom four centuries of conquest and fighting had called into existence in Japan: he felt that domestic peace could not be permanently restored unless these restless spirits were occupied abroad. But although that object may have reinforced his purpose, his ambition aimed at nothing less than the conquest of China, and he regarded Korea merely as a stepping-stone to that aim. Had Korea consented to be put to such a use, she need not have fought or suffered. The Koreans, however, counted China invincible. They considered that Japan would be shattered by the first contact with the great empire, and therefore, although, in the 15th century, they had given the use of their harbours to the Mongol invaders of Japan, they flatly refused in the 16th to allow their territory to be used for a Japanese invasion of China. On the 24th of May 1592 the wave of invasion rolled against Korea's southern coast. Hideyoshi had chosen Nagoya in the province of Hizen as the home-base of his operations. There the sea separating Japan from the Korean peninsula narrows to a strait divided into two channels of almost equal width by the island of Tsushima. To reach this island from the Japanese side was an easy and safe task, but in the narrow channel that separated Tsushima from the peninsula, an invading flotilla had to run the risk of attack by any number of ships. At Nagoya Hideyoshi assembled an army of over 300,000 men, of whom some 70,000 constituted the first fighting line, 87,000 the second, and the remainder formed a reserve to be subsequently drawn on as occasion demanded. The question of transport presented some difficulty, but it was solved by the simple expedient of ordering every feuatory to furnish two ships for each 100,000 koku of his fief's revenue. These were not fighting vessels but mere transports. As for the plan of campaign, it was precisely in accord with modern principles of strategy, and bore witness to the daring genius of Hideyoshi. The van, consisting of three army corps and mustering in all 51,000 men, was to cross rapidly to Fusan, on the south coast of the peninsula, and immediately commence a movement northward towards the capital, Seoul, one corps moving by the eastern coast-road, one by the central route, and one by the western coast-line. Thereafter the other four corps, which formed the first fighting line, together with the corps under the direct orders of the commander-in-chief, Ukida Hideye, were to cross, for the purpose of effectually subduing the regions through which the van had passed; and, finally, the two remaining corps of the second line were to be transported by sea up the west coast of the peninsula, to form a junction with the van which, by that time, should be preparing to pass into China over the northern boundary of Korea, namely, the Yalu River. For the landing place of these reinforcements the town of Phyong-yang was adopted, being easily accessible by the Taidong River from the coast. In later ages Japanese armies were destined to move twice over the same regions, once to the invasion of China, once to the attack of Russia, and they adopted almost the same strategical plan as that mapped out by Hideyoshi in the year 1592. The forecast was that the Koreans would offer their chief resistance, first, at the capital, Seoul; next at Phyong-yang, and finally at the Yalu, as the approaches to all these places offered positions capable of being utilized to great advantage for defensive purposes.

On the 24th of May 1592 the first army corps, under the command of Konishi Yukinaga, crossed unmolested to the peninsula; next day the castle of Fusan was carried by storm, which same fate befall, on the 27th, another and stronger fortress lying 3 miles inland and garrisoned by 20,000 picked soldiers. The invaders were irresistible. From the landing-place at Fusan to the gates of Seoul the distance is 267 miles. Konishi's corps covered that interval in 19 days, storming two forts, carrying two positions and fighting one pitched battle en route. On the 12th of June the Korean capital was in Japanese hands, and by the 16th four army corps had assembled there, while four others had effected a landing at Fusan. After a rest of 15 days the northward advance was resumed, and July 15th saw Phyong-yang in Japanese possession. The distance of 150 miles from Seoul to the Taidong had been traversed in 18 days, 10 having been occupied in forcing the passage of a river which, if held with moderate resolution and skill, should have stopped the Japanese altogether. At this point, however, the invasion suffered a check owing to a cause which in modern times has received much attention, though in Hideyoshi's days it had been little considered; the Japanese lost the command of the sea.

The Japanese idea of sea-fighting in those times was to use open boats propelled chiefly by oars. They closed as quickly as possible with the enemy, and then fell on with the trenchant swords which they used so skilfully. Now during the 15th century and part of the 16th the Chinese had been so harassed by Japanese piratical raids that their inventive genius, quickened by suffering, suggested a device for coping with these formidable adversaries. Allow the Japanese swordsmen to come to close quarters and he carried all before him. To keep him at a distance, then, was the great desideratum, and the Chinese compassed this in maritime warfare by completely covering their boats with roofs of solid timber, so that those within were protected against missiles, while loop-holes and ports enabled them to pour bullets and arrows upon those who attempted to approach. The Koreans found this device from the Chinese and were the first to employ it in actual warfare. Their own history alleges that they improved upon the Chinese model by nailing sheet iron over the roofs and sides of the "turtle-shell" craft and studding the whole surface with chevaux de frise, but Japanese annals indicate that in the great majority of cases solid timber alone was used. It seems strange that the Japanese should have been without any clear perception of the immense fighting superiority possessed by such protected war-vessels over small open boats. But certainly they were either ignorant or indifferent. The fleet which they provided to hold the command of Korean waters did not include one vessel of any magnitude; it consisted simply of some hundreds of row-boats manned by 7000 men. Hideyoshi himself was perhaps not without misgivings. Six years previously he had endeavoured to obtain two war-galleons from the Portuguese, and had he succeeded, the history of the Far East might have been radically different. Evidently, however, he committed a blunder which his countrymen in modern times have conspicuously avoided; he drew the sword without having fully investigated his adversary's resources. Just about the time when the van of the Japanese army was entering Seoul, the Korean admiral Yi Sun-sin, at the head of a fleet of 80 vessels, attacked the Japanese squadron which lay at anchor near the entrance to Fusan harbour, set 26 of the vessels on fire and dispersed the rest. Four other engagements ensued in rapid succession. The last and most important took place shortly after the Japanese troops had seized Phyong-yang. It
resulted in the sinking of over 70 Japanese vessels, transports and fighting ships combined, which formed the main part of a flotilla carrying reinforcements by sea to the van of the invading army. This despatch of troops and supplies by water had been a leading feature of Hideyoshi's plan of campaign, and the destruction of the flotilla to which the duty was entrusted may be said to have sealed the fate of the war by isolating the army in Korea from its home base. It is true that Konishii Yukinaga, who commanded the first division, would have continued his northward march from Phyong-yang without delay. He argued that China was wholly unprepared, and that the best hope of ultimate victory lay in not giving her time to collect her forces. But the commander-in-chief, Ukida Hideyei, refused to endorse this plan. He took the view that since the Korean provinces were still offering desperate resistance, supplies could not be drawn from them, neither could the troops engaged in subjugating them be freed for service at the front. Therefore it was essential to await the consummation of the second phase of Hideyoshi's plan, namely, the despatch of reinforcements and munitions by water to Phyong-yang. The reader has seen how that second phase fared. The Japanese commander at Phyong-yang never received any accession of strength. His force suffered constant diminution from casualties, and the question of commissariat became daily more difficult. It is further plain to any reader of history—and Japanese historians themselves admit the fact—that no wise effort was made to conciliate the Korean people. They were treated so harshly that even the humble peasant took up arms, and thus the peninsula, instead of serving as a basis of supplies, had to be garrisoned perpetually by a strong army.

The Koreans, having suffered for their loyalty to China, naturally looked to her for succour. Again and again appeals were made to Peking, and at length a force of 3,000 men, which had been mobilized in the Liaotung peninsula, crossed the Yalu and moved south to Phyong-yang, where the Japanese van had been halting for over two years. This was early in October 1592. Memorable as the first encounter between Japanese and Chinese, the incident also illustrated China's supreme confidence in her own ineffable superiority. The whole of the Korean forces had been driven northward throughout the entire length of the peninsula by the Japanese armies, yet Peking considered that 3,000 Chinese "braves" would suffice to roll back this tide of invasion. Three thousand of the Chinese were killed and the remainder fled pell-mell across the Yalu. China now began to be seriously alarmed. She collected an army variously estimated at from 51,000 to 200,000 men, and marching it across Manchuria in the dead of winter, hurled it against Phyong-yang during the first week of February 1593. The Japanese garrison did not exceed 20,000, nearly one-half of its original number having been detached to hold a line of forts which guarded the communications with Seoul. Moreover, the Chinese, though their swords were much inferior to those of the Japanese, possessed great superiority in artillery and cavalry, as well as in the fact that their troopers were iron mail which defied the keenest blade. Thus, after a severe fight, the Japanese had to evacuate Phyong-yang and fall back upon Seoul. But this one victory alone stands to China's credit. In all subsequent encounters of any magnitude her army suffered heavy defeats, losing on one occasion some 10,000 men, on another 4,000, and on a third 39,000. But the presence of her forces and the determined resistance offered by the Koreans effectively saved China from invasion. Indeed, after the evacuation of Seoul, on the 9th of May 1593, Hideyoshi abandoned all idea of carrying the war into Chinese territory, and devoted his attention to obtaining honourable terms of peace, the Japanese troops meanwhile holding a line of forts along the southern coast of Korea. He died before that end had been accomplished. Had he lived a few days longer, he would have learned of a crushing defeat inflicted on the Chinese forces (at S-čchin, October 30, 1593), when the Satsuma men under Shimazu Yoshihiro took 38,700 Chinese heads and sent the noses and ears to Japan, where they now lie buried under a tumulus (mimisuka) near the temple of Daibutsu in Kōto. Thereafter the statesmen to whom the regent on his death-bed had entrusted the duty of terminating the struggle and recalling the troops, intimidated to the enemy that the evacuation of the peninsula might be obtained if a Korean prince repaired to Japan as envoy, and if some tiger-skins and ginseng were sent to Kōto in token of amity. So ended one of the greatest over-sea campaigns recorded in history. It had lasted 63 years, had seen 200,000 Japanese troops at one time on Korean soil, and had cost something like a quarter of a million lives.

From the recall of the Korea expedition in 1598 to the resumption of intercourse with the Occident in modern times, Japan enjoyed uninterrupted peace with foreign nations. Thereafter she had to engage in four wars. It is a striking contrast. During the first eleven centuries of her historical existence she was involved in only one contest abroad; during the next half century she fought four times beyond the sea and was confronted by many complications. Whatever material or moral advantages her association with the West conferred on her, it did not bring peace.

The first menacing foreign complication with which the Japanese government of the Melit era had to deal was connected with the traffic in Chinese labour, an abuse not yet eradicated. In 1872, a Peruvian ship, the Luz, put into port at Yokohama, carrying 200 contract labourers. One of the unfortunate men succeeded in reaching the shore and made a piteous appeal to the Japanese authorities, who at once seized the vessel and released her freight of slaves, for they were little better. The Japanese had not always been so particular. In the days of early foreign intercourse, before England's attitude towards slavery had established a new code of ethics, Portuguese ships had been permitted to carry away from Hirado, as they did from Macao, cargoes of men and women, doomed to a hard life and more than a hundred years of servitude on the shores of the New World. But modern Japan followed the tenets of modern morality in such matters. Of course the Peruvian government protested, and for a time relations were strained almost to the point of rupture; but it was finally agreed that the question should be submitted to the arbitration of the tsar, who decided in Japan's favour. Japan's attitude in this affair elicited applause, not merely from the point of view of humanity, but also because of the confidence she showed in Occidental justice.

Another complication which occupied the attention of the Tokyō government from the beginning of the Melit era was in truth a legacy from the days of feudalisun. In those days the island of Yezo, as well as Sakhalin on its north-west and the Kurile group on its north, could scarcely be said to be in effective Japanese occupation. It is true that the feudal chief of Matsumae (now Fuku-yama), the remains of whose castle may still be seen on the coast at the southern extremity of the island of Yezo, exercised nominal jurisdiction; but his functions did not greatly exceed the levying of taxes on the aboriginal inhabitants of Yezo, the Kuriles and southern Sakhalin. Thus from the beginning of the 18th century Russian fishermen began to settle in the Kuriles and Russian ships menaced Sakhalin. There can be no doubt that the first explorers of Sakhalin were Japanese. As early as 1620, some vassals of the feudal chief of Matsumae visited the place and passed a winter there. It was then supposed to be a peninsula forming part of the Asiatic mainland, but in 1856 a daring Japanese traveller, by name Mamiya Rinzo, made his way to Manchuria, voyaged up and down the Amur, and, crossing to Sakhalin, discovered that a narrow strait separated it from the mainland. There still prevails in the minds of many Occidentals a belief that the discovery of Sakhalin's insular character was reserved for Captain Nevelskoy, a Russian, who visited the place in 1849, but in Japan the fact had then been known for 43 years. Muraviev, the great Russian empire-builder in East Asia, under whose orders Nevelskoy acted, quickly appreciated the necessity of acquiring Sakhalin, which commands the estuary of the Amur.
After the conclusion of the treaty of Aigun (1857) he visited Japan with a squadron, and required that the strait of La Pèrouse, which separates Sakhalin from Yesso, should be regarded as the frontier between Russia and Japan. This would have given the whole of Sakhalin to Russia; Japan refused, and Muraviev immediately resorted to the policy he had already pursued with signal success in the Usuri region: he sent emigrants to settle in Sakhalin. Twice the shōgunate attempted to frustrate this process of gradual absorption by proposing a division of the island along the 50th parallel of north latitude, and finally, in 1872, the Meiji government offered to purchase the Russian portion for 2,000,000 dollars (then equivalent to about £400,000). St Petersburg, having by that time discovered the comparative worthlessness of the island as a wealth-earning possession, showed some signs of acquiescence, and possibly an agreement might have been reached had not a leading Japanese statesman—afterwards Count Kuroda—opposed the bargain as disadvantageous to Japan. Finally St Petersburg's perseverance won the day. In 1875 Japan agreed to recognize Russia's title to the whole island on condition that Russia similarly recognized Japan's title to the Kuriles. It was a singular compact. Russia purchased a Japanese property and paid for it with a part of Japan's belongings. These details form a curious preface to the fact that Sakhalin was desired, yet it is not to be doubted that the Russian invasion, in the sequel of which it was divided along the 50th parallel as the shōgun's administration had originally proposed.

The first of Japan's four conflicts was an expedition to Formosa in 1874. Insignificant from a military point of view, this affair derives vicarious interest from its effect upon the relations between China and Japan, and upon the question of the ownership of the Rükkü islands. These islands, which lie at a little distance south of Japan, had for centuries been regarded as an anapage of the Satsuma fief. The language and customs of their inhabitants showed unmistakable traces of relationship to the Japanese, and the possibility of the islands being included among the dominions of China had probably never occurred to any Japanese statesman. When therefore, in 1873, the crew of a wrecked Rükküan junk were barbarously treated by the inhabitants of northern Formosa, the Japanese government hesitatingly assumed the responsibility of seeking redress for their outrage. Formosa being a part of the Chinese Empire, complaint was duly pressed and a treaty concluded, which formally limited to China the Kuroko islands, and recognized the Rükkü islands as Japanese. This treaty, which was afterwards annulled by the Treaty of Peace at the close of the Sino-Japanese War, was, however, merely an acquiescence in the existing situation, and a manifest recognition of Japan's independence, which had been achieved by her own efforts. The treaty seems reducible to a working theory. So long as her own advantage could be promoted, she regarded as a tolée vassalage the presents periodically carried to her court from neighbouring states. So soon, however, as there arose any question of discharging a suzerain's duties, she classed these offerings as insignificant interchanges of neighbourly courtesy. It was true that Rükkü had followed the custom of despaching gift-bearing envoys to China from time to time, just as Japan herself had done, though with less regularity. But it was also true that Rükkü had been subdued by Satsuma without China stretching out a hand to help her; that for two centuries the islands had been included in the Satsuma fief, and that China, in the sequel to the Formosan affair, had made a practical acknowledgment of Japan's superior title to protect the islanders. Each empire positively asserted its claims; but whereas Japan put hers into practice, China confined herself to remonstrances. Things remained in that state until 1880, when General Grant, visiting the East, suggested the advisability of a compromise. A conference met in Peking, and the plenipotentiaries agreed that the islands should be divided, Japan taking the northern group, China the southern. But on the eve of signature the Chinese plenipotentiary drew back, pleading that he had no authority to conclude an agreement without previous consultation with certain other dignitaries. Japan, sensible that she had been flouted, retired from the discussion and retained the islands, China's share in them being reduced to a grievance.

From the 16th century, when the Korean peninsula was overrun by Japanese troops, its rulers made a habit of sending a present-bearing embassy to Japan to felicitate the accession of each shōgun. But after the fall of the Tokugawa shōgunate, the Korean court demanded that the custom, declared to have no further relations with a country embracing Western civilization, and refused even to receive a Japanese embassy. This conduct caused deep umbrage in Japan. Several prominent politicians cast their votes for war, and undoubtedly the sword would have been drawn had not the leading statesmen felt that a struggle with Korea, involving probably a rupture with China, must fatally check the progress of the administrative reforms then (1873) in their infancy. Two years later, however, the Koreans crowned their defiance by firing on the boats of a Japanese war-vessel engaged in the operation of coast-surveying. No choice now remained except to despatch an expedition against Korea. This expedition, which was composed of a force of war-ships and transports, but instead of proceeding to extremities, she employed the squadron—which was by no means so strong as it seemed—to intimidate Korea into signing a treaty of amity and commerce, and opening three ports to foreign trade (1876). That was the beginning of Korea's friendly relations with the outer world, and Japan naturally took credit for the fact that, thus early in her new career, she had become an instrument for extending the principle of universal intercourse opposed so strenuously by herself in the past.

From time immemorial China's policy towards the petty states on her frontiers had been to utilize them as buffers for softening the shock of foreign contact, while constraining, at the same time, that her relations with them should involve no inconvenient responsibilities for herself. The aggressive impulses of the outside world were to be checked by an unproclaimed understanding that the territories of these petty states were never to be regarded as parts of China, while the states, on their side, must never expect their suzerain to bear the consequences of their acts. This arrangement, depending largely on sentiment and prestige, retained its validity in the atmosphere of Oriental seclusion, but quickly failed to endure the test of modern Occidental practicality. Tongking, Annam, Siam and Burma were withdrawn, one by one, from the fiction of dependence on China and independence towards all other countries. But with regard to Korea, China proved more tenacious. The
negotiations she acquired conventional titles that touched the core of China’s alleged suzerainty. In 1883 her right to maintain troops in Seoul for the protection of her legation was admitted; in 1885 she concluded with China a convention by which each power pledged itself not to send troops to Korea without notifying the other.

In the spring of 1894 a serious insurrection broke out in Korea, and the Min family appealed for China’s aid. On the 6th of July 2500 Chinese troops embarked at Tientsin and were transported to the peninsula, where they went into camp at Yashan (Asan), on the south-west coast, notice of the measure being given by the Chinese government to the Japanese representative at Peking, according to treaty. During the interval immediately preceding these events, Japan had been rendered acutely sensible of China’s arbitrary and unfriendly interference in Korea. Twice the efforts of the Japanese government to obtain redress for unlawful and ruinous commercial prohibitions had been thwarted by the Chinese representative in Seoul; and an ultimatum addressed from Tokyo to the Korean government had elicited from the viceroy Li in Tientsin a thinly veiled threat of Chinese armed opposition. Still more provocative of national indignation was China’s procedure with regard to the murder of Kim Ok-kyun, the leader of progress in Korea, who had been for some years a refugee in Japan. Invited from Japan to China by a fellow-countryman sent from Seoul to assassinate him, Kim was shot in a Japanese hotel in Shanghai; and China, instead of punishing the murderer, conveyed him in a war-ship of her own to Korea to be publicly honoured. When, therefore, the Korean insurrection of 1894 induced the Min family again to solicit China’s armed intervention, the Tōkyō government concluded that, in the interests of Japan’s security and of civilization in the Orient, steps must be taken to put an end to the misrule which offered incessant invitations to foreign aggression, and checked Korea’s capacity to maintain its own independence. Japan did not claim for herself any-by the dispositions in the peninsula superior to those there by China. But there was not the remotest probability that China, whose face had been contemptuously set against all the progressive measures adopted by Japan during the preceding twenty-five years, would join in forcing upon a neighbouring kingdom the very reforms she herself despised, were her cooperation invited through ordinary diplomatic channels only. It was necessary to contrive a situation which would not only furnish clear proof of Japan’s resolution, but also enable her to pursue her programme independently of Chinese endorsement, should the latter be finally unobtainable. She therefore met the course of a despatch of troops with a corresponding notice of her own, and the month of July 1894 found a Chinese force assembled at Asan and a Japanese force occupying positions in the neighbourhood of Seoul. China’s motive for sending troops was nominally to quell the Tonghak insurrection, but really to re-affirm her own dominion in the peninsula. Japan’s motive was to secure such a position as would enable her to insist upon the radically curative treatment of Korea’s malady. Up to this point the two empires were strictly within their conventional rights. Each was entitled by treaty to send troops to Korea, provided that notice was given to the other. But China, in giving notice, described Korea as her “tributary state,” thus thrusting into the forefront of the discussion a contention which Japan, from conciliatory motives, would have kept out of sight. Once formally advanced, however, the claim had to be challenged. In the treaty of amity and commerce concluded in 1876 between Japan and Korea, the two high contracting parties were explicitly declared to possess the same national status. Japan could not agree that a power which for nearly two decades she had acknowledged and treated as her equal should be openly classed as a tributary of China. She protested, but the Chinese statesmen took no notice of her protest. They continued to apply the disputed appellation to Korea, and they further asserted their assumption of sovereignty in the peninsula by seeking to set limits to the number of troops sent by Japan, as well as to the sphere of their employment. Japan then proposed that
the two empires should unite their efforts for the suppression of disturbances in Korea, and for the subsequent improvement of that kingdom's administration, the latter purpose to be pursued by the despatch of a joint commission of investigation. But China refused everything. Ready at all times to interfere by force of arms between the Korean people and the dominant political faction, she declined to interfere in any way for the promotion of reform. She even expressed supercilious surprise that Japan, while asserting Korea's independence, should suggest the idea of peremptorily reforming its administration. In short, for Chinese purposes the Peking statesmen openly declared Korea a tributary state; but for Japanese purposes they insisted that it must be held independent. They believed that their island neighbour aimed at the absorption of Korea into the Japanese empire. Viewed in the light of that suspicion, China's attitude became comprehensible, but her procedure was inconsistent, illogical and unpractical. The Tōkyō cabinet now declared its resolve not to withdraw the Japanese troops without "some understanding that would guarantee the future peace, order, and good government of Korea," and since China still declined to offer such an understanding, Japan undertook the work of reform single-handed.

The Chinese representative in Seoul threw his whole weight into the scale against the success of these reforms. But the determining cause of rupture was in itself a belligerent operation. China's troops had been sent originally for the purpose of quelling the Tonghak rebellion. But the rebellion having died of inanition before the landing of the troops, their services were not required. Nevertheless China kept them in Korea, her declared reason for doing so being the presence of a Japanese military force. Throughout the subsequent negotiations the Chinese forces lay in an entrenched camp at Asan, while the Japanese occupied Seoul. An attempt on China's part to send reinforcements could be construed only as an unequivocal declaration of resolve to oppose Japan's proceedings by force of arms. Nevertheless China not only despatched troops by sea to strengthen the camp at Asan, but also sent an army overland across Korea's northern frontier. At this stage an act of war occurred. Three Chinese men-of-war, conveying a transport with 1200 men encountered and fired on three Japanese cruisers. One of the Chinese ships was taken; another was so shattered that she had to be beached and abandoned; the third escaped in a dilapidated condition; and the transport, refusing to surrender, was sunk. This happened on the 25th of July 1894, and an open declaration of war was made by each empire six days later.

From the moment when Japan applied herself to break away from Oriental traditions, and to remove from her limbs the fetters of Eastern conservatism, it was inevitable that a widening gulf should gradually grow between herself and China. The war of 1894 was really a contest between Japanese progress and Chinese stagnation. To secure Korean immunity from foreign—especially Russian—aggression was of capital importance to both empires. Japan believed that such security could be attained by introducing into Korea the civilization which had contributed so signally to the development of her own strength and resources. China thought that she could guarantee it without any departure from old-fashioned methods, and by the same process of capricious protection which had failed so signally in the cases of Annam, Tongking, Burma and Siam. The issue really at stake was whether Japan should be allowed to act as the Eastern propagandist of Western progress, or whether her efforts in that cause should be held in check by Chinese conservatism.

The war itself was a succession of triumphs for Japan. Four days after the first naval encounter she sent from Seoul a column of troops who routed the Chinese entrenched at Asan. Many of the fugitives effected their escape to Phyong-yang, a town on the Taidong River, offering excellent facilities for defence, and historically interesting as the place where a Japanese army of invasion had its first encounter with Chinese troops in 1592. There the Chinese assembled a force of 17,000 men, and made leisurely preparations for a decisive contest. Forty days elapsed before the Japanese columns converged upon Phyong-yang, and that interval was utilized by the Chinese to throw up parapets, mount Krupp guns and otherwise strengthen their position. Moreover, they were armed with repeating rifles, whereas the Japanese had only single-loaders, and the ground offered little cover for an attacking force. In such circumstances, the advantages possessed by the defence ought to have been wellnigh insuperable; yet a day's fighting sufficed to carry all the positions, the assailants' casualties amounting to less than 700 and the defenders losing 6000 in killed and wounded. This brilliant victory was the prelude to an equally conspicuous success at sea. For on the 17th of September, the very day after the battle at Phyong-yang, a great naval fight took place near the mouth of the Yalu River, which forms the northern boundary of Korea. Fourteen Chinese warships and six torpedo-boats were returning to home ports after convoying a fleet of transports to the Yalu, when they encountered eleven Japanese men-of-war cruising in the Yalu estuary. Having been advised that the Chinese had sedulously avoided a contest at sea. Their fleet, under the command of Rear Admiral Higashi, consisted of belligerents of over 7000 tons displacement, whereas the biggest vessels on the Japanese side were belted cruisers of only 4000 tons. In the hands of an admiral appreciating the value of sea power, China's naval force would certainly have been led against Japan's maritime communications, for a successful blow struck there must have put an end to the Korean campaign. The Chinese, however, failed to read history. They employed their war-vessels as convoys only, and, when not using them for that purpose, hid them in port. Everything goes to show that they would have avoided the battle off the Yalu had choice been possible, though when forced to fight they fought bravely. Four of their ships were sunk, and the remainder escaped to Wei-hai-wei, the vigour of the Japanese pursuit being greatly impaired by the presence of torpedo-boats in the retreating squadron.

The Yalu victory opened the over-sea route to China. Japan could now strike at Taliien, Port Arthur, and Wei-hai-wei, naval stations on the Liaotung and Shantung peninsulas, where powerful permanent fortifications had been built by European experts and armed with the best modern weapons, were regarded as almost impregnable. They fell before the assaults of the Japanese troops as easily as the comparatively rude fortifications at Phyong-yang had fallen. The only resistance of a stubborn character was made by the Chinese fleet at Wei-hai-wei; but after the whole squadron of torpedo-boat had been destroyed or captured as they attempted to escape, and after three of the largest vessels had been sunk at their moorings by Japanese torpedoes, and one by gun-fire, the remaining ships surrendered, and their brave commander, Admiral Ting, committed suicide. This ended the war. It had lasted seven and a half months, during which time Japan put into the field five columns, aggregating about 120,000 of all arms. One of these columns marched northward from Seoul, won the battle of Phyong-yang, advanced to the Yalu, forced its way into Manchuria, and moved towards Mukden by Feng-hwang, fighting several minor engagements, and conducting the greater part of its operations among deep snow in midwinter. The second column diverged westwards from the Yalu, and, marching through southern Manchuria, reached Hai-cheng, whence it advanced to the capture of Niuchwang and Ying-tse-kow. The third landed on the Liaotung peninsula, and, turning southwards, carried Taliien and Port Arthur by assault. The fourth moved up the Liaotung peninsula, and, having seized Kaiping, advanced against Ying-tse-kow, where it joined hands with the second column. The fifth crossed from Port Arthur to Wei-hai-wei, and captured the latter. In all these operations the total Japanese casualties were 1025 killed and 4922 wounded—figures which sufficiently indicate the inefficiency of the Chinese fighting. The deaths from disease totalled 16,866, and the total monetary expenditure was £20,000,000 sterling.
The Chinese government sent Li Hung-chang, viceroy of Pechil and senior grand secretary of state, and Li Ching-fong, to discuss terms of peace with Japan, the latter being represented by Marquis (afterwards Prince) Itô and Count Mutsu, prime minister and minister for foreign affairs, respectively. A treaty was signed at Shimonoseki on the 17th of April 1895, and subsequently ratified by the sovereigns of the two empires. It declared the absolute independence of Korea; ceded to Japan the part of Manchuria lying south of a line drawn from the mouth of the river Anping to the mouth of the Liao, through Feng-hwang, Hai-cheng and Ying-tse-kow, as well as the islands of Formosa and the Pescadores; pledged China to pay an indemnity of 200,000,000 taels; provided for the occupation of Wei-hai-wei by Japan pending payment of the indemnity; secured some additional commercial privileges, such as the opening of four new places to foreign trade and the right of foreigners to engage in manufacturing enterprises in China, and provided for the conclusion of a treaty of commerce and amity between the two empires, based on the lines of China's treaties with Occidental powers.

No sooner was this agreement ratified than Russia, Germany and France presented a joint note to the Tokyo government, recommending that the territories ceded to Japan on the ground of Chino-French division of China should be occupied, as such a proceeding would be detrimental to peace. The recommendation was couched in the usual terms of diplomatic courtesy, but everything indicated that its signatories were prepared to enforce their advice by an appeal to arms. Japan found herself compelled to comply. Exhausted by the Chinese campaign, which had drained her treasury, consumed her supplies of warlike material, and kept her squadrons constantly at sea for eight months, she had no residue of strength to oppose such a coalition. Her resolve was quickly taken. The day that saw the publication of the ratified treaty saw also the issue of an Imperial rescript in which the mikado, avowing his unalterable devotion to the cause of peace, and recognizing that the counsel offered by the European states was prompted by the same sentiment, "yielded to the dictates of magnanimity, and accepted the advice of the three Powers." The Japanese people were shocked by this incident. They could understand the motives influencing Russia and France, for it was evidently natural that the former should desire to exclude warlike and progressive people like the Japanese from territories contiguous to her own, and it was also natural that France should endeavor to strengthen her alliance with Russia. But Germany, wholly uninterested in the ownership of Manchuria, and by profession a warm friend of Japan, seemed to have joined in robbing the latter of the fruits of her victory simply for the sake of establishing some shadowy title to Russia's goodwill. It was not known until a later period that the German emperor entertained profound apprehensions about the "yellow peril," an irruption of Oriental hordes into the Occident, and held it a sacred duty to prevent Japan from gaining a position which might enable her to construct an immense military machine out of the countless millions of China.

Japan's third expedition over-sea in the Meiji era had its origin in causes which belong to the history of China (q.v.). In the second half of 1900 an anti-foreign and antidynastic rebellion, breaking out in Shantung, spread to the metropolitan province of Pechil, and resulted in a situation of extreme peril for the foreign communities of Tientsin and Peking. It was impossible for any European power, or for the United States, to organize sufficiently prompt measures. Moreover, the eyes of the world turned to Japan, whose proximity to the scene of disturbance rendered intervention comparatively easy for her. But Japan hesitated. Knowing now with what suspicion and distrust the development of her resources and the growth of her military strength were regarded by some European peoples, and aware that she had been admitted to the comity of Western nations on sufferance, she shrank, on the one hand, from seeming to grasp at an opportunity for armed display, and, on the other, from the solecism of obtur-
of Muraviev, she reached the mouth of that great river, the acquisition of Nikolaevsk for a naval base was her immediate reward. But Nikolaevsk could not possibly satisfy her. Situated in an inhospitable region far away from all the main routes of the world’s commerce, it offered itself only as a stepping-stone to further acquisitions. To push southward from this new port became an immediate object to Russia. There lay an obstacle in the way, however; the long strip of sea-coast from the mouth of the Amur to the Korean frontier—an area then called the Usuri region because the Usuri forms its western boundary—belonged to China, and she, having conceded much to Russia in the matter of the Amur, showed no disposition to make further concessions in the matter of the Usuri. In the presence of menaces, however, she agreed that the region should be regarded as common property pending a convenient opportunity for clear delimitation. That opportunity came very soon. Seizing the moment (1860) when China had been beaten to her knees by England and France, Russia secured final cession of the Usuri region, which now became the maritime province of Siberia. Then Russia shifted her naval base on the Pacific from Nikolaevsk to Vladivostok. She gained ten degrees in a southerly direction.

From the mouth of the Amur, where Nikolaevsk is situated, to the southern shore of Korea there rests on the coast of eastern Asia an arch of islands having at its northern point Sakhalin and at its southern Tsushima, the keystone of the arch being the main island of Japan. This arch embraces the Sea of Japan and is washed on its convex side by the Pacific Ocean. Immediately after the transfer of Russia’s naval base from Nikolaevsk to Vladivostok, an attempt was made to obtain possession of the southern point of the arch, namely, Tsushima. A Russian man-of-war proceeded thither and quietly began to establish a settlement, which would soon have constituted a title of ownership had not Great Britain interfered. The Russians saw that Vladivostok, acquired at the cost of so much toil, would be comparatively useless unless from the sea on whose shore it was situated an avenue to the Pacific could be opened, and they therefore tried to obtain command of the Tsushima channel. Immediately after reaching the mouth of the Amur the same instinct had led them to begin the colonization of Sakhalin. The axis of this long narrow island is inclined at a very acute angle to the Usuri region, which its northern extremity almost touches, while its southern is separated from Yezo by the strait of La Pérouse. But in Sakhalin the Russians found Japanese subjects. In fact the island was a part of the Japanese empire. Resorting, however, to the Usuri fiction of joint occupation, they succeeded by 1875 in transferring the whole of Sakhalin to Russia’s dominion. Further encroachments upon Japanese territory could not be lightly essayed, and the Russians held their hands. They had been trebly checked: checked in trying to push southward along the coast of the mainland; checked in trying to secure an avenue from Vladivostok to the Pacific; and checked in their search for an ice-free port, which definition Vladivostok did not fulfil. Enterprise in the direction of Korea seemed to be the only hope of saving the maritime results of the great Trans-Asian march.

Was Korea within safe range of such enterprises? Everything seemed to answer in the affirmative. Korea had all the qualifications desired by an aggressor. Her people were unprogressive, her resources undeveloped, her self-defensive capacities insignificant, her government corrupt. But she was a tributary of China, and China had begun to show some tenacity in protecting the integrity of her buffer states. Besides, Japan was understood to have pretensions with regard to Korea. On the whole, therefore, the problem of carrying to full fruition the work of Muraviev and his lieutenants demanded strength greater than Russia could exercise without some line of communications supplementing the Amur waterway and the long ocean route. Therefore she set about the construction of a railway across Asia.

The Amur being the boundary of Russia’s east Asian territory, this railway had to be carried along its northern bank where many engineering and economic obstacles presented themselves. Besides, the river, from an early stage in its course, makes a huge semicircular sweep northward, and a railway following its bank to Vladivostok must make the same détour. If, on the contrary, the road could be carried over the diameter of the semicircle, it would be a straight and therefore shorter line, technically easier and economically better. The diameter, however, passed through Chinese territory, and an excuse for extorting China’s permission was not in sight. Russia therefore proceeded to build each end of the road, deferring the construction of the Amur section for the moment. She had not waited long when, in 1894, war broke out between China and Japan, and the latter, completely victorious, demanded as the price of peace the southern littoral of Manchuria from the Korean boundary to the Liaotung peninsula at the entrance to the Gulf of Pechili. This was a crisis in Russia’s career. She saw that her maritime extension could never get nearer to the Pacific than Vladivostok were this claim of Japan’s established. For the proposed arrangement would place the littoral of Manchuria in Japan’s direct occupation and the littoral of Korea in her constructive control, since not only had she fought to rescue Korea from Chinese suzerainty, but also her object in demanding a slice of the Manchurian coast-line was to protect Korea against aggression from the north; that is to say, against aggression from Russia. Muraviev’s enterprise had carried his country first to the mouth of the Amur and thence southward along the coast to Vladivostok and to Possiet Bay at the north-eastern extremity of Korea. But it had not given to Russia free access to the Pacific, and now she was menaced with a perpetual barrier to that access, since the whole remaining coast of east Asia as far as the Gulf of Pechili was about to pass into Japan’s possession or under her domination.

Then Russia took an extraordinary step. She persuaded Germany and France to force Japan out of Manchuria. It is not to be supposed that she frankly exposed her own aggressive designs and asked for assistance to prosecute them. Neither is it to be supposed that France and Germany were so curiously bent in perspicacity as to overlook those designs. At all events these three great powers served on Japan a notice to quit, and Japan, exhausted by her struggle with China, had no choice but to obey.

The notice was accompanied by an exposition of reasons. Its signatories said that Japan’s tenure of the Manchurian littoral would menace the security of the Chinese capital, would render the independence of Korea illusory, and would constitute an obstacle to the peace of the Orient.

By way of saving the situation in some slight degree Japan sought from Chinese a guarantee that no portion of Manchuria should thereafter be leased or ceded to a foreign state. But France warned Japan that to press such a demand would offend Russia, and Russia declared that, for her part, she had no intention of trespassing in Manchuria. Japan, had she been in a position to insist on the guarantee, would also have been in a position to disobey the mandate of the three powers. Unable to do either the one or the other, she quietly stepped out of Manchuria, and proceeded to double her army and treble her navy.

As a reward for the assistance nominally rendered to China in this matter, Russia obtained permission in Peking to divert her Trans-Asian railway from the huge bend of the Amur to the straight line through Manchuria. Neither Germany nor France received any immediate recompense. Three years later, by way of indemnity for the murder of two missionaries by a mob, Germany seized a portion of the province of Shantung. Immediately, on the principle that two wrongs make a right, Russia obtained a lease of the Liaotung peninsula, from which she had driven Japan in 1895. This act she followed by extorting from China permission to construct a branch of the Trans-Asian railway through Manchuria from north to south.

Russia’s maritime aspirations had now assumed a radically altered phase. Instead of pushing southward from Vladivostok and Possiet Bay along the coast of Korea, she had suddenly
Japan watched all these things with profound anxiety. If there were any reality in the dangers which Russia, Germany and France had declared to be incidental to Japanese occupation of a part of Manchuria, the same dangers must be doubly incidental to Russian occupation of the whole of Manchuria—the security of the Chinese capital would be threatened, and an obstacle would be created to the permanent peace of the East. The independence of Korea was an object of supreme solicitude to Japan. Historically she held towards the little state a relation closely resembling that of suzerain, and though of her ancient conquests nothing remained except a settlement at Fusan on the southern coast, her national sentiment would have been deeply wounded by any foreign aggression in the peninsula. It was to establish Korean independence that she waged war with China in 1894; and her annexation of the Manchurian littoral adjacent to the Korean frontier, after the war, was designed to secure that independence, not to menace it as the triple alliance professed to think. But if Russia came into possession of all Manchuria, her subsequent absorption of Korea would be almost inevitable. For the consideration set forth above as to Vladivostok's maritime avenues would then acquire absolute cogency. Manchuria is larger than France and the United Kingdom lumped together. The addition of such an immense area to Russia's east Asiatic dominions, together with its littoral on the Gulf of Pechili and the Yellow Sea, would necessitate a corresponding expansion of her naval forces in the Far East. With the one exception of Port Arthur, however, the Manchurian coast does not offer any convenient naval base. It is only in the splendid harbours of southern Korea that such bases can be found. Moreover, there would be an even stronger motive compelling Russia towards Korea. Neither the Usuri region nor the Manchurian littoral possesses so much as one port qualified to satisfy her perennial longing for free access to the ocean in a temperate zone. Without Korea, then, Russia's east Asian expansion, though it added huge blocks of territory to her dominions, would have been commercially incomplete and strategically defective.

If it be asked why, apart from history and national sentiment, Japan should object to a Russian Korea, the answer is, first, because there would thus be planted almost within cannon-shot of her shores a power of enormous strength and insatiable ambition; secondly, because, whatever voice in Manchuria's destiny Russia derived from her railway, the same voice in Korea's destiny was possessed by Japan as the sole owner of railways in the peninsula; thirdly, that whereas Russia had an altogether insignificant share in the foreign commerce of Korea and scarcely ten bona-fide settlers, Japan did the greater part of the over-sea trade and had tens of thousands of settlers; fourthly, that if Russia's dominions stretched uninterruptedly from the Sea of Okhotsk to the Gulf of Pechili, her ultimate absorption of north China would be as certain as sunset; and fifthly, that such domination and such absorption would involve the practical closure of all that immense region to Japanese commerce and industry as well as to the commerce and industry of every Western nation except Russia. This last proposition did not rest solely on the fact that to oppose artificial barriers to free competition is Russia's sole hope of utilizing to her own benefit any economic opportunities brought within her reach. It rested also on the fact that Russia had objected to foreign settlements at the marts recently opened by treaty with China to American and Japanese subjects. Without settlements, trade at those marts would be impossible, and thus Russia had constructively announced that there should be no trade but Russian, if she could prevent it.

Against such dangers Japan would have been justified in adopting any measure of self-protection. She had foreseen them for six years, and had been strengthening herself to avert them. But she wanted peace. She wanted to develop her material resources and to accumulate some measure of wealth, without which she must remain insignificant among the nations. Two pacific devices offered, and she adopted them both. Russia, instead of trusting time to consolidate her tenure of Manchuria, had made the mistake of pragmatically importuning China for a conventional title. If then Peking could be strengthened to resist this demand, some arrangement of a distinctly terminable nature might be made. The United States, Great Britain and Japan, joining hands for that purpose, did succeed in so far stifening China's backbone that her show of resolution finally induced Russia to sign a treaty pledging herself to withdraw her troops from Manchuria in three instalments, each step of evacuation to be accomplished by a fixed date. That was one of the pacific devices. The other suggested itself in connexion with the new commercial treaties which China had promised to negotiate in the sequel of the Boxer troubles. In these documents clauses provided for the opening of three places in Manchuria to foreign trade. It seemed a reasonable hope that, having secured commercial access to Manchuria by covenant with its sovereign, China, the powers would not allow Russia arbitrarily to restrict their privileges. It seemed also a reasonable hope that Russia, having solemnly promised to evacuate Manchuria at fixed dates, would fulfil her engagement.

The latter hope was signally disappointed. When the time came for evacuation, Russia behaved as though no promise had ever been given. She proposed wholly new conditions, which would have strengthened her grasp of Manchuria instead of loosening it. China being powerless to offer any practical protest, and Japan's interests ranking next in order of importance, the Tōkyō government approached Russia directly. They did not ask for anything that could hurt her pride or injure her position. Appreciating fully the economical status she had acquired in Manchuria by large outlays of capital, they offered to recognize that status, provided that Russia would extend similar recognition to Japan's status in Korea, would promise, in common with Japan, to respect the sovereignty and the territorial integrity of China and Korea, and would be a party to a mutual engagement that all nations should have equal industrial and commercial opportunities in Manchuria and the Korean peninsula. In a word, they invited Russia to subscribe the policy enunciated by the United States and Great Britain, the policy of the open door and of the integrity of the Chinese and Korean empires.

Thus commenced a negotiation which lasted five and a half months. Japan gradually reduced her demands to a minimum. Russia never made the smallest appreciable concession. She refused to listen to Japan for one moment about Manchuria. Eight years previously Japan had been in military possession of Manchuria, and Russia with the assistance of Germany and France had expelled her for reasons which concerned Japan incomparably more than they concerned any of the three powers—the security of the Chinese capital, the independence of Korea, the peace of the East. Now, Russia had the splendid assurance to declare by implication that none of these things concerned Japan at all. The utmost she would admit was Japan's partial right to be heard about Korea. And at the same time she herself commenced in northern Korea a series of aggressions, partly perhaps to show her potentialities, partly to waylay comparable opposition. That was not all. Whilst she studiously deferred her answers to Japan's proposals and protracted the negotiations to an extent which was actually comelious, she hastened to send eastward a big fleet of war-ships and a new army of soldiers. It was impossible for the dullest politician to mistake her purpose. She intended to yield nothing, but to prepare such a parade of force that her obstinacy would
command submission. The only alternatives for Japan were war or total and permanent effacement in Asia. She chose war, and in fighting it she fought the battle of free and equal opportunities for all without undue encroachment upon the sovereign rights or territorial integrity of China or Korea, against a military dictatorship, a programme of ruthless territorial annexation and a policy of selfish restrictions.

The details of the great struggle that ensued are given elsewhere (see Russo-Japanese War). After the battle of Mukden the belligerents found themselves in a position which must either prelude another stupendous effort on both sides or be utilized for the purpose of peace negotiations. At this point the president of the United States of America intervened in the interests of humanity, and on the 9th of June 1905 instructed the United States' representative in Tōkyō to urge that the Japanese government should open direct negotiations with Russia, an exactly corresponding note being simultaneously sent to the Russian government through the United States' representative in St Petersburg. Japan's reply was made on the 30th of June. It intimated frank acquiescence, and Russia lost no time in complying therewith. A similar effort having been made for the reduction of differences before the plenipotentiaries of the belligerents met, on the 10th of August, at Portsmouth, New Hampshire, U.S.A. Russia sent M. (afterwards Count) de Witte and Baron Rosen; Japan, Baron (afterwards Count) Komura, who had held the portfolio of foreign affairs throughout the war, and Mr. (afterwards Baron) Takahira. In entering this conference, Japanese statesmen, as was subsequently known, saw clearly that a great part of the credit accruing to them for their successful conduct of the war would be forfeited in the sequel of the negotiations. For the people of Japan had accustomed themselves to expect that Russia would assuredly recoup the expenses incurred by their country in the contest, whereas the cabinet in Tōkyō understood well that to look for payment of indemnity by a great state whose territory had not been invaded effectively nor its existence menaced must be futile. Nevertheless, diplomacy required that this conviction should be concealed, and thus Russia carried to the conference a belief that the financial phase of the discussion would be completed at the time of the conference, the Japanese nation reckoned fully on an indemnity of 150 millions sterling. Baron Komura's mandate was, however, that the only radically essential terms were those formulated by Japan prior to the war. She must insist on securing the ends for which she had fought, since she believed them to be indispensable to the peace of the Far East, but she would not demand anything more. The Japanese plenipotentiary, therefore, judged it wise to marshal his terms in the order of their importance, leaving his Russian colleague to imagine, as he probably would, that the converse method had been adopted, and that everything preliminary to the questions of finance and territory was of minor consequence. The negotiations, commenced on the 10th of August, were not concluded until the 28th of September, when a treaty of peace was signed. There had been a moment when the onlooking world believed that unless Russia agreed to ransom the island of Sakhalin by paying to Japan a sum of 120 millions sterling, the conference would be broken off; nor did such an exchange seem unreasonable, for were Russia expelled from the northern part of Sakhalin, which commands the estuary of the Amur River, her position in Siberia would have been considerably impaired. But the statesmen who directed Japan's affairs were not disposed to make any display of earth-hunger. The southern half of Sakhalin had originally belonged to Japan and had passed into Russia's possession by an arrangement which the Japanese nation strongly resented. To recover that portion of the island seemed, therefore, a legitimate ambition. Japan did not contemplate any larger demand, nor did she seriously insist on an indemnity. Therefore the negotiations were never in real danger of failure. The treaty of Portsmouth recognized Japan's "paramount political, military and economic interests" in Korea; provided for the simultaneous evacuation of Manchuria by the contracting parties; transferred to Japan the lease of the Liaotung peninsula held by Russia from China together with the Russian railways south of Kwantung-flats and all collateral mining or other privileges; ceded to Japan the southern half of Sakhalin, the 50th parallel of latitude to be the boundary between the two parts; secured fishing rights for Japanese subjects along the coasts of the seas of Japan, Okhotsk and Bering; laid down that the expenses incurred by the Japanese for the maintenance of the Russian prisoners during the war should be reimbursed by Russia, less the outlays made by the latter on account of Japanese prisoners—by which arrangement Japan obtained a payment of some 4 millions sterling—and provided that the contracting parties, while withdrawing their military forces from Manchuria, might maintain guards to protect their respective railways, the number of such guards not to exceed 15 per kilometre of line. There were other important restrictions: first, the contracting parties were to abstain from making, on the Russo-Korean frontier, any military measures which might menace the security of Russian or Korean territory; secondly, the two powers pledged themselves not to exploit the Manchurian railway or other varieties of similar work, or to take any military measures which might impede the free navigation of the straits of La Péruse and the Gulf of Tartary. The above provisions concerned the two contracting parties only. But China's interests also were considered. Thus it was agreed to "restore entirely and completely to her exclusive administration" all portions of Manchuria then in the occupation, or under the control of Japanese or Russian troops, except the leased territory; that her consent must be obtained for the transfer to Japan of the leases and concessions held by the Russians in Manchuria; that the Russian government would disavow the possession of "any territorial advantages or preferential or exclusive concessions in impairment of Chinese sovereignty or inconsistent with the principle of equal opportunity in Manchuria"; and that Japan and Russia "engaged reciprocally not to obstruct any general measures common to all countries which China might take for the development of the commerce and industry of Manchuria." This distinction between the special interests of the contracting parties as to Russia's relations with China herself as well as of foreign nations generally is essential to the understanding of a situation which subsequently attracted much attention. From the time of the opium war (1857) to the Boxer rising (1900) each of the great Western powers struggled for its own hand in China, and each sought to gain for itself exclusive concessions and privileges with comparatively little regard for the interests of others, and with no regard whatever for China's sovereign rights. The fruits of this period were: permanently ceded territories (Hong-Kong and Macao); leases temporarily establishing foreign sovereignty in various districts (Kiao-chow, Wei-hai-wei and Kwant-chow); railway and mining concessions; and the establishment of settlements at open ports where foreign jurisdiction was supreme. But when, in 1900, the Boxer rising forced all the powers into a common camp, they awoke to full appreciation of a principle which had been growing current for the past two or three years, namely, that concerted action on the lines of maintaining China's integrity and securing to all alike equality of opportunity and a similarly open door, was the only feasible method of preventing the partition of the Chinese Empire and averting a fresh war of aggression which might have disastrous results. This, of course, did not mean that there was to be any abandonment of special privileges already acquired or any surrender of existing concessions. The arrangement was not to be retrospective in any sense. Vested interests were to be strictly guarded until the lapse of the periods for which they had been granted, or until the maturity of China's competence to be really autonomous. A curious situation was thus created. International professions of respect for China's sovereignty, for the integrity of her empire and for the enforcement of the open door and equal opportunity,
Having waged two wars on account of Korea, Japan emerged from the second conflict with the conviction that the policy of maintaining the independence of Korea must be modified, and that since the identity of Korea and Japan was in the Japanese, interests in the Far East and the paramount character of Japanese interests in Korea would not permit Japan to leave Korea to the care of any third power, she must assume the charge herself. Europe and America also recognized that view of the situation, and consented to withdraw their legations from Seoul, thus leaving the control of Korean foreign affairs entirely in the hands of Japan, who further undertook to assume military direction in the event of aggression from without or disturbance from within. But in the matter of internal administration she continued to limit herself to advisory supervision. Thus, though a Japanese resident-general in Seoul, with subordinate residents throughout the provinces, assumed the functions hitherto discharged by foreign representatives and consuls, the Korean government was merely asked to employ Japanese experts in the position of counsellors, the right to accept or reject their counsels being left to their employers. Once again, however, the futility of looking for any real reforms under this optional system was demonstrated. Japan sent her most renowned statesman, Prince Ito, to discharge the duties of resident-general; but even he, in spite of profound patience and tact, found that some less optional methods must be resorted to. Hence on the 24th of July, 1907, a new agreement was signed, by which the resident-general acquired initiative as well as consultative competence to enact and enforce laws and ordinances, to appoint and remove Korean officials, and to place capable Japanese subjects in the ranks of the administration. That this constituted a heavy blow to Korea's independence could not be gainsaid. That it was inevitable seemed to be equally obvious. For there existed in Korea nearly all the worst abuses of medieval systems. The administration of justice depended solely on favour or interest. The police contributed by corruption and incompetence to the insecurity of life and property. The troops were a body of use- less mercenaries. Offices being allotted by sale, thousands of incapable thronged the ranks of the executive. The emperor's court was crowded by diviners and plotters of all kinds, male and female. The finances of the throne and those of the state were hopelessly confused. There was nothing like an organized judiciary. A witness was in many cases considered particeps criminis; torture was commonly employed to obtain evidence, and defendants in civil cases were placed under arrest. Imprisonment meant death or permanent disablement for a man of small means. Flogging so severe as to cripple, if not to kill, was a common punishment; every minor offence from robbery upward was capital, and female criminals were frequently executed by administering shockingly painful poisons. The currency was in a state of the utmost confusion. Extreme corruption and extortion were practised in connection with taxation. Finally, while nothing showed that the average Korean lacked the elementary virtue of patriotism, there had been repeated proofs that the safety and independence of the empire counted for little in the estimates of political intriguers. Japan must either step out of Korea altogether or effect drastic reforms there. She necessarily chose the latter alternative, and the things which she accomplished between the beginning of 1906 and the close of 1908 may be briefly described as the elaboration of a proper system of taxation; the organization of a staff to administer annual budgets; the re-assessment of taxable property; the floating of public loans for productive enterprises; the establishment of the banks of the empire, of the banks of various kinds, including agricultural and commercial; the creation of associations for putting bank-notes into circulation; the introduction of a warehousing system to supply capital to farmers; the lighting and buoying of the coasts; the provision of posts, telegraphs, roads and railways; the erection of public buildings; the starting of various industrial enterprises (such as printing, brick-making, forestry and coal-mining); the laying out of model farms; the beginning of cotton cultivation; the
building and equipping of an industrial training school; the inauguration of sanitary works; the opening of hospitals and medical schools; the organization of an excellent educational system; the construction of waterworks in several towns; the complete remodelling of the central government; the differentiation of the court and the executive, as well as of the administration and the judiciary; the formation of an efficient body of police; the organization of law courts with a majority of Japanese jurists on the bench; the enactment of a new penal code; drastic reforms in the taxation system. In the summer of 1907 the resident-general advised the Throne to disband the standing army as an unserviceable and expensive force. The measure was doubtless desirable, but the docility of the troops had been overrated. Some of them resisted vehemently, and many became the nucleus of an insurrection which lasted in a desultory manner for nearly two years; cost the lives of 21,000 insurgents and 1300 Japanese; and entailed upon Japan an outlay of nearly a million sterling. Altogether Japan was 15 million sterling out of pocket on Korea's account by the end of 1909. She had also lost the veteran statesman Prince Ito, who was assassinated at Harbin on the 24th of January, 1909. Finally an end was put to an anomalous situation by the annexation of Korea to Japan on the 29th of August, 1910. (See further KOREA.)

IX.—DOMESTIC HISTORY

Cosmography.—Japanese annals represent the first inhabitant of earth as a direct descendant of the gods. Two books describe the events of the "Divine age." One, compiled in 712, is called the Kojiki (Records of Ancient Matters); the other, compiled in 720, is called the Nihongi (Chronicles of Japan). Both describe the processes of creation, but the author of the Chronicles drew largely upon Chinese traditions, whereas the compilers of the Records appear to have limited themselves to materials which they believed to be native. The Records, therefore, have always been regarded as the more trustworthy guide to pure Japanese conceptions. They deal with the creation of Japan only, other countries having been apparently judged unworthy of attention. At the beginning of all things a primordial trinity, Isu-kami, is represented as existing on the "plain of high heaven." Thereafter, during an indefinite time and by an indefinite process, other deities come into existence, their titles indicating a vague connexion with constructive and fertilizing forces. They are not immortal: it is explicitly stated that they ultimately pass away, and the idea of the cosmographers seems to be that each deity marks a gradual approach to human methods of procreation. Meanwhile the earth is "young and, like floating oil, drifts about after the manner of a jelly-fish." At last there are born two deities, the creator and the creatress, and these receive the mandate of all the heavenly beings to "make, consolidate and give birth to the drifiting land." For use in that work a jewelled spear is given to them, and, standing upon the bridge that connects heaven and earth, they thrust downwards with the weapon, stir the brine below and draw up the spear, when from its point fall drops which, accumulating form the first dry land. Upon this land the two deities descend, and, by ordinary processes, beget the islands of Japan as well as numerous gods representing the forces of nature. But in giving birth to the god of fire the creatress (Izanami) perishes, and the creator (Izanagi) makes his way to the under-world in search of her—an obvious parallel to the tales of Ishtar and Orpheus. With difficulty he returns to earth, and, as he washes himself from the pollution of Hades, there are born from the turbid water a number of evil deities succeeded by a number of good, just as in the Babylonian cosmogony the primordial ocean, Tiamat, brings forth simultaneously gods and imps. Finally, as Izanagi washes his left eye the Goddess of the Sun comes into existence; as he washes his right, the God of the Moon; and as he washes his nose, the God of Force. To these three he assigns, respectively, the dominion of the sun, the dominion of the moon, and the dominion of the ocean. But the god of force (Sosano), like Lucifer, rebels against this decree, creates a commotion in heaven, and after having been the cause of the temporary seclusion of the sun goddess and the consequent wrapping of the world in darkness, kills the goddess of food and is permanently banished from heaven by the host of deities. He descends to Izumo on the west of the main island of Japan, and there saves a maiden from an eight-headed serpent. Sosano himself passes to the under-world and becomes the deity of Hades, but he invests one of his descendants with the sovereignty of Japan, and the title is established after many curious adventures. To the sun goddess also, whose feud with her fierce brother survives the latter's banishment from heaven, the idea of making her grandson ruler of Japan presents itself. She despatches three embassies to impose her will upon the descendants of Sosano, and finally her grandson descends, not, however, in Izumo, where the demi-gods of Sosano's race hold sway, but in Hiüga in the southern island of Kiiushí. This grandson of Amaterasu (the goddess of the sun) is called Ninigi, whose great-grandson figures in Japanese history as the first human sovereign of the country, known during life as Kamu-Yamato-Iware-Biko, and given the name of Jimmu tennō (Jimmu, son of heaven) (the compound name was the title of the first Japanese emperor, and Jimmu is the name under which the accession of Amaterasu to the year 660 B.C. Why that date was chosen must remain a matter of conjecture. The Records of Ancient Matters has no chronology, but the more pretentious writers of the Chronicles of Japan, doubtless in imitation of their Chinese models, considered it necessary to assign a year, a month, and even a day for each event of importance. There is abundant reason, however, to question the accuracy of all Japanese chronology prior to the 5th century. The first date corroborated by external evidence is 401, and Aston, who has made a special study of the subject, concludes that the year 500 may be taken as the time when the chronology of the Chronicles begins to be trustworthy. Many Japanese, however, are firm believers in the Chronicles, and when assigning the year of the empire they invariably take 660 B.C. for starting-point, so that 1909 of the Gregorian calendar becomes for them 2569.

Prehistoric Period.—Thus, if the most rigid estimate be accepted, the space of 1160 years, from 660 B.C. to A.D. 500, may be called the prehistoric period. During that long interval the annals include 24 sovereigns, the first 17 of whom lived for over a hundred years on the average. It seems reasonable to conclude that the so-called assignment of the sovereignty of Japan to Sosanoo's descendants and the establishment of their kingdom in Izumo represent an invasion of Mongol immigrants coming from the direction of the Korean peninsula—indeed one of the Nihongi's versions of the event actually indicates Korea as the point of departure—and that the subsequent descent of Ninigi on Mount Takachiko in Hiüga indicates the advent of a body of Malayan settlers from the south sea. Jimmu, according to the Chronicles, set out from Hiüga in 667 B.C. and was not crowned at his new palace in Yamato until 660. This campaign of seven years is described in some detail, but no satisfactory information is given as to the nature of the craft in which the invader and his troops voyaged, or as to the number of men under his command. The weapons said to have been carried were bows, spears and swords. A superhuman element is imparted into the narrative in the form of the three-legged crow of the sun, which Amaterasu sends down to act as guide and messenger for her descendants. Jimmu died at his palace of Kashiwa-bara in 585 B.C., his age being 127 according to the Chronicles, and 137 according to the Records. He was buried in a kind of tomb called misasagi, which seems to have been in use in Japan for some centuries before the Christian era—"a highly specialized form of tumulus, consisting of two mounds, one having a circular, the other a triangular base, which merged into each other, the whole being surrounded by a moat, or sometimes by two concentric moats with a narrow strip of land between. In some, perhaps in most, cases the misasagi contains a large vault of great unhewn stones without mortar. The walls of this vault converge gradually towards the top, which is roofed in by enormous slabs of stone weighing

gresses throughout their dominions, and on these occasions a not uncommon incident was the addition of some local beauty to the Imperial harem. This licence had a far-reaching effect, since to provide for the sovereign's numerous offspring—the emperor Keikō (71–136) had 80 children—no better way offered than to make grants of land, and thus were laid the foundations of a territorial nobility destined profoundly to influence the course of Japanese history. Woman continues to figure conspicuously in the story. The image of the sun goddess, enshrined in Ise (5 B.C.), is entrusted to the keeping of a princess, as are the mirror, sword and jewel inherited from the sun goddess; a woman (Tachibana) accompanies Prince Yamato-dake in his campaign against the Yemishi, and sacrifices her life to quell a tempest at sea; Saho, consort of Suinin, is the heroine of a most tragic tale in which the conflict between filial piety and conjugal loyalty leads to her self-destruction; and a woman is found ruling over a large district in Kiūshū when the Emperor Keikō is engaged in his campaign against the aborigines. The reign of Suinin saw the beginning of an art destined to assume extraordinary importance in Japan—the art of wrestling—and the first champion, Nomi no Sukune, is honoured for having suggested that clay figures should be made, in whose human sacrifices hitherto offered at the sepulture of Imperial heroes was this ignominious work commenced in the time of Suinin were zealously continued under his two immediate successors, Suinin and Keikō. More than 800 ponds and channels are described as having been constructed under the former's rule. We find evidence also that the sway of the throne had been by this time widely extended, for in 125 a governor-general of 15 provinces is nominated, and two years later, governors (miyakko) are appointed in every province and mayors (inaki) in every village. The number or names of these local divisions are not given, but it is explained that mountains and rivers were taken as boundaries of provinces, the limits of towns and villages being marked by roads running respectively east and west, north and south.

An incident is now reached which the Japanese count a landmark in their history, though foreign critics are disposed to regard it as apocryphal. It is the invasion of Korea by a Japanese army under the command of the emperor Jingo, in 200 B.C. The emperor Chūai, having proceeded to the north with a powerful army, is said to have conducted a campaign against the Kuma-so, is there joined by the emperor's uncle, the viceroy of Kyūshū, with the intention of conquering the district. But the emperor refuses to believe in the existence of any such country, and heaven punishes his incredulity with death at the hands of the Kuma-so, according to one account; from the effects of disease, according to another. The calamity is concealed; the Kuma-so are subdued, and the emperor, having collected a fleet and raised an army, crosses to the state of Silla (Kinorea), where, at the spectacle of her overwhelming strength, the Korean monarch submits without fighting, and swears that until the sun rises in the west, until rivers run towards their sources, and until pebbles ascend to the sky and become stars, he will do homage and send tribute to Japan. His example is followed by the kings of the two other states constituting the Korean peninsula, and the warlike emperor returns triumphant. Many supernatural elements embellish the tale, but the features which chiefly discredit it are that it abounds in anachronisms, and that the event, despite its signal importance, is not mentioned in either Chinese or Korean history. It is certain that China then possessed in Korea territory claimed by Chinese governors. She must therefore have had cognisance of such invasion, had it occurred. Moreover, Korean history mentions twenty-five raids made by the Japanese against Silla during the first five centuries of the Christian era, but not one of them can be indentified with Jingo's alleged expedition. There can be no doubt that the early Japanese were an aggressive, enterprising people, and that their nearest over-sea neighbours suffered much from their activity. Nor can there be any reasonable doubt that the Jingo tale contains a large germ of truth, and is at least an echo of the relations that existed between Japan and Korea in the 3rd and 4th centuries. The records of the 69 years comprising

many tons each. The entrance is by means of a gallery roofed with similar stones.” Several of these ancient sepulchral mounds have been examined during recent years, and their contents have furnished information of much antiquarian interest, though there is a complete absence of inscriptions. The reigns of the eight sovereigns who succeeded Jimmu were absolutely uneventful. Nothing is set down except the genealogy of each ruler, the place of his residence and his burial, his age and the date of his death. It was then the custom—and it remained so until the 8th century of the Christian era—to change the capital on the accession of each emperor; a habit which effectually prevented the growth of any great metropolis. The reign of the 10th emperor, Sūjin, lasted from 98 to 30 B.C. During his era the land was troubled by pestilence and the people broke out in rebellion; calamities which were supposed to be caused by the spirit of the ancient ruler of Izumo to avenge a want of consideration shown to his descendants by their suppliants. Divination—by a Chinese process—and visions revealed the source of trouble; rites of worship were performed in honour of the ancient ruler, his descendant being entrusted with the duty, and the pestilence ceased. We now hear for the first time of the author of this prophecy, who, it is supposed, had denounced the plan to the Ainu. Four generals are sent out against them in different directions. But the expedition is interrupted by an armed attempt on the part of the emperor's half-brother, who, utilizing the opportunity of the troops' absence from Yamato, marches from Yamashiro at the head of a powerful army to win the crown for himself. In connexion with these incidents, curious evidence is furnished of the place then assigned to woman by the writers of the Chronicles. It is a girl who warns one of the emperor's generals of the plot; it is the sovereign's aunt who interprets the warning; and it is Ata, the wife of the rebellious prince, who leads the left wing of his army. Four other noteworthy facts are recorded of this reign: the taking of a census; the imposition of a tax on animals' skins and game to be paid by men, and on textile fabrics by women; the building of boats for coastwise transport, and the digging of dikes and reservoirs for agricultural purposes. All these things rest solely on the testimony of annalists writing eight centuries later than the era they discuss and compiling their narratives from oral traditions; and all may have been made to ascertain whether the histories of China and Korea corroborate or contradict those of Japan. Without entering into detailed evidence, the inference may be at once stated that the dates given in Japanese early history are just 120 years too remote; an error very likely to occur when using the sexagenary cycle, which constituted the first method of reckoning time in Japan. But although this correction suffices to reconcile some contradictory features of Far-Eastern history, it does not constitute any explanation of the incredible longevity assigned by the Chronicles to several Japanese sovereigns, and the conclusion is that when a consecutive record of reigns came to be compiled in the 8th century, many lacunae were found which had to be filled up from the imagination of the compilers. With this parenthesis we may pass rapidly over the events of the next two centuries (29 B.C. to A.D. 200). They are remarkable for vigorous measures to subdue the aboriginal Ainu, who in the southern island of Kiūshū are called Kuma-so (the names of two tribes) and sometimes earth-spiders (i.e. cave-dwellers), while in the north-eastern regions of the main island they are designated Yemishi. Expeditions are led against them in both regions by Prince Yamato-dake, a hero revered by all succeeding generations of Japanese as the type of valour and loyalty. Dying from the effects of hardship and exposure, but declaring with his last breath that loss of life was nothing compared with the sorrow of seeing his father's face no more, his spirit ascends to heaven as a white bird, and when his son, Chūai, comes to the throne, he causes cranes to be placed in the most surrounding his palace in memory of his illustrious sire.

The sovereignty had partly ceased to follow the example of Jimmu, who led his armies in person. The emperors did not, however, pass a sedentary life. They frequently made pro-
Jingo's reign are in the main an account of intercourse, sometimes peaceful, sometimes stormy, between the neighbouring countries. Only one other episode occupies a place: it is an attempt on the part of Jingo's step-brothers to oppose her return to Yamato and to prevent the accession of her son to the throne. It should be noted here that all such names as Jimmu, Stjin, Chitéi, &c., are posthumous, and were invented in the reign of Kwammu (782–806), the fashion being taken from China and the names themselves being purely Chinese transcriptions of the qualities assigned to the respective monarchs. Thus Jimmu signifies "divine valour"; Stjin, "deity-honouring"; and Chitéi, "sad middle son." The names of these rulers during life were wholly different from their posthumous appellations.

Chinese history, which is incomparably older and more precise than Korean, is by no means silent about Japan. Long notices occur in the later Han and Wei records (25 to 265). The Japanese are spoken of as dwarfs (Wā), and their islands, frequently called the queen country, are said to be mountainous, with soil suitable for growing grain, hemp, and the silk-worm mulberry. The climate is so mild that vegetables can be grown in winter and summer; there are neither oxen, horses, nor leopards; the people understand the art of weaving; the men tattoo their faces and bodies in patterns indicating differences of rank; male attire consists of a single piece of cloth; females wear a gown passed over the head, and tie their hair in a braid; soldiers are armed with spears and shields, and also with bows, from which they discharge arrows tipped with bone or iron; the sovereign resides in Yamato; there are stockaded forts and houses; food is taken with the fingers but is served on bamboo trays and wooden trestles; foot-gear is not worn; when men of the lower classes meet a man of rank, they leave the road and retire to the grass, squatting or kneeling with both hands on the ground when they address him; intoxicating liquor is much used; the people are long-lived, many reaching the age of 100; women are more numerous than men; there is no theft, and litigation is infrequent; the women are faithful and not jealous; all men of high rank have four or five wives, others two or three; wives and children of law-breakers are conscripted, and for grave crimes the offender's family is extirpated; divination is practised by burning bones; mourning lasts for some ten days and the rites are performed by a "mourning-keeper"; after a funeral the whole family perform ablutions; fishing is much practised, and the fishermen are skilled divers; there are distinctions of rank and some are vassals to others; each province has a market where goods are exchanged; the country is divided into more than 100 provinces, and among its products are white pearls, green jade and cinnabar. These annals go on to say that between 147 and 190 civil war prevailed for several years, and order was finally restored by a female sovereign, who is described as having been old and unmarried; much addicted to magic arts; attended by a thousand females; dwelling in a palace with lofty pavilions surrounded by a stockade and guarded by soldiers; but leading such a secluded life that few saw her face except one man who served her and acted as a medium of communica- tion. This is the tale of the legendary Jingo who, according to Japanese annals, came to the throne in the year A.D. 200, and whose every public act had its inception or promotion in some alleged divine interposition. In one point, however, the Chinese historians are certainly incorrect. They represent tattooing as universal in ancient Japan, whereas it was confined to criminals, in whose case it played the part that branding does elsewhere. Centuries later, in feudal days, the habit came to be practised by men of the lower orders whose avocations involved baring the body, but it never acquired vogue among educated people. In other respects these ancient Chinese annals must be credited with remarkable accuracy in their description of Japan and the Japanese. Their account may be advantageously compared with Professor Chamberlain's analysis of the manners and customs of the early Japanese, in the preface to the translation of the Kojiki.

"The Japanese of the mythical period, as pictured in the legends preserved by the compiler of the Records of Ancient Matters, were a race who had long endured from the savage stage and had attained to a high level of barbaric skill. The Stone Age was forgotten by them—or nearly so—and the evidence pointing to their never having passed through a genuine Bronze Age, though the knowledge of bronze was at a later period introduced from the neighbouring continent. They used iron for manufacturing spears, swords and knives of various shapes, and likewise for the more peaceful purpose of making hooks which they used for excavating fish from their huts. Their other warlike and hunting implements (besides traps and gins, which appear to have been equally used for catching beasts and birds and for destroying human enemies) were bows and arrows. It is an interesting fact that in Japan special allusion is made to the fact that the arrows were feathered. Perhaps clubs should be added to the list. Of the bows and arrows, swords and knives, there is perpetual mention, but nowhere do we hear of the tools with which they were manufactured. There is the same remarkable silence regarding such widely spread domestic implements as the saw and the axe. We hear, however, of the pestle and mortar, of the fire-drill, of the wedge, of the sickle, and of the shuttle used in weaving. Navigation seems to have been in a very elementary state. Indeed the art of sailing was but little practised in Japan even so late as the middle of the 10th century of our era, subsequent to the general diffusion of Chinese civilization, though rowing and punting are often mentioned by the early poets. To what we should call towns or villages very little reference is made anywhere in the Records or in that part of the Chronicles which contain the account of the so-called Divine Age. But from what we learn incidently the total population was chiefly made up of small hamlets and isolated dwellings; the coast and up the course of the larger streams. Of house-building there is frequent mention. Fences were in use. Rugs of skins and rush-mattings were occasionally brought in to sit on, and we even hear of two or three huts distantly grouped by the noble and wealthy. The habits of personal cleanliness which so pleasantly distinguish the modern Japanese from their neighbours, in continental Asia, though less fully developed than at present, have had a long history; it is said that the inhabitants read more than once of bathing in rivers, and are told of bathing women being specially attached to the person of a certain Imperial infant. Lustrations, too, formed part of the religious practices of the race. The disputes and brawls which at one time or another seem to have been situated away from the houses and to have been generally placed over a running stream, whence the name for latrine in the archaic dialect—kawaya (river-house). A peculiar sort of dwelling called a huts—being prominent under ice—was the so-called parturition house, occupied but without windows, which a woman was expected to build and retire into for the purpose of being delivered unassisted. Castles are not distinctly spoken of until a time which coincides, according to the religious calendar, with the introduction of Buddhism. We meet with the curious term rice-castle, whose precise significance is a matter of dispute among the native commentators, but which, on comparison with Chinese descriptions of the early Japanese, should probably be understood as referring to a house, the undertak- ing of a redoubt, behind which the warriors could enclose them- selves. The food of the early Japanese consisted of fish and of the flesh of the wild creatures which fell by the hunter's arrow or were lured with wicker and other tactual plants. All the garments here is such mention made as to place it beyond a doubt that its cultivation dates back to time immemorial. Beans, millet and barley are indeed named once, together with silkworms, in the account of the Divine Age. But the passage has evidently been interpolated in the legend, perhaps not dating back long before the time of the eighth-century compiler. A few unimportant vegetables and fruits; of most of which there is but a single mention, are found. The intoxicating liquor was drink; it was known by the name of mushikawa so were chopsticks for eating food with. Cooking pots and cups and dishes—the latter both of earthenware and of leaves of trees—are also mentioned; but of the use of fire for warming purposes we hear nothing, and tables are mentioned sometimes, but we have no idea what the use of the food: they would seem to have been exclusively for the purpose of presenting offerings on, and were probably quite small and—low—in fact, rather trays than tables, according to European ideas. In the use of clothing and the cleanliness of their persons, the early Japanese reached a high level. We read in the most ancient legends of upper garments, skirts, trousers, girdles, veils and hats, while both sexes adorned themselves with necklaces, bracelets, head ornaments and stones. The wigs and false hair, specific to their ancestors in ancient times, to their descendants in modern times, of whose attire jewel forms no part. The material of their clothes was hemp cloth and paper—mulberry bark, coloured by being rubbed with madder, and probably with other tactual plants. All the garments here as far as we may judge, were woven, sewing being nowhere mentioned. From the great place which the chase occupied in daily life, we are led to suppose that skins also were used to make garments of. There is in the Records at least one passage which favours this supposition.
and the Chronicles in one place mention the straw rain-coat and broad-brimmed hat, which still form the Japanese peasant's effectual protection against the inclemencies of the weather. The tendrils of creeping plants served the purposes of strings, and bound the "varen," or rice-plant, to the waist. Combs are mentioned, and it is evident that much attention was devoted to the dressing of the hair. The men seem to have bound up their hair in two bunches, one on each side of the head, while the young boys tied theirs in a top-knot, the unshorn locks being afterwards doubled over their brows. The married women dressed theirs after a fashion which apparently combined the two last-named methods. There is no mention in any of the old books of cutting the hair or beard except in cases of disgrace, but for the matter of the head-dress, were distinguished by a diversity of apparel and ornamentation. With regard to the precious stones mentioned above as having been used as ornaments for the head, neck and arms, we know from the specimens which have rewarded the labours of archaeologists in Japan that amongst the precious stones, serpentine and stiate were the most used materials, and carved and pierced cylindrical shapes the commonest forms. The horse—which was ridden, but not driven—the barn-door fowl and the corn-mor used for fishing, are the only domesticated creatures mentioned in the earlier traditions, with the doubtful exception of the silk-worm. In the later portions of the Records and Chronicles dogs and cattle are alluded to, but sheep, swine and even cats were apparently not yet introduced."

As the prehistoric era draws to its end the above analyses of Japanese civilization have to be modified. Thus, towards the close of the 3rd century, ship-building made great progress, and instead of the small boats hitherto in use, a vessel 100 ft. long was constructed. Notable above all is the fact that Japan's turbulent relations with Korea were replaced by friendly intercourse, so that she began to receive from her neighbour instruction in the art of writing. The date ascribed by the Chronicles for this important event is A.D. 285, but it has been proved almost conclusively that Japanese annals relating to this period are in error to the extent of 120 years. Hence the introduction of calligraphy must be placed in 405. Chinese history shows that between 57 and 247 Japan sent four embassies to the courts of the Han and the Wei, and this intercourse cannot have failed to develop the knowledge of the Chinese. But the knowledge of writing has not been confined to a few interpreters, and not until the year 405 were steps taken to extend it, with the aid of a learned Korean, Wang-in. Korea herself began to study Chinese learning only a few years before she undertook to impart it to Japan. We now find a numerous colony of Koreans passing to Japan and settling there; a large number are also carried over as prisoners of war, and the Japanese obtain seamstresses from both of their continental neighbours. One fact, related with much precision, shows that the refinements of life were in an advanced condition: an ice-house is described, and we read that from 374 (? 494) it became the fashion to store ice in this manner for use in the hot months by placing it in water or sake. The emperor, Nintoku, to whose time this innovation is attributed, is one of the romantic figures of Japanese history. He commenced his career by refusing to accept the sovereignty from his younger brother, who pressed him earnestly to do so on the ground that the proper order of succession had been disturbed by their father's partiality towards the latter. But the knowledge of writing did not receive imperative recognition in Japan early in the year. After three years of this mutual self-effacement, during which the throne remained vacant, the younger brother committed suicide, and Nintoku reluctantly became sovereign. He chose Naniwa (the modern Osaka) for his capital, but he would not take the farmers from their work to finish the building of a palace, and subsequently, inferring from the absence of smoke over the houses of the people that the country was impoverished, he remitted all taxes and suspended forced labour for a term of three years, during which his palace fell into a state of ruin and he himself fared in the coarsest manner. Digging canals, damming rivers, constructing roads and bridges, and establishing granaries occupied his attention when love did not distract it. But in affairs of the heart he was most unhappy. He figures as the sole wearer of the Japanese crown who was defied by his consort; for when he took a concubine in despite of the empress, her jealousy was so bitter that, refusing to be placated by any of his parleys or other overtures, she left the palace altogether, and when he sought to introduce another beauty into the inner chamber, his own half-brother, who carried his proposals, won the girl for himself. One other fact deserves to be remembered in connexion with Nintoku's reign: Ki-no-tsuno, representative of a great family which had filled the highest administrative and military posts under several sovereigns, is mentioned as "the first to commit to writing in detail the productions of the soil in each locality." This was in 573 (probably 473). We shall err little if we date the commencement of Japanese written annals from this time, though no compilation earlier than the Kojiki has survived.
